Contents — Volume 3

1. On Liberty — John Stuart Mill [2011]

2. Untitled — Unknown [2011]

3. Untitled — Arnold Aletrino [2011]

4. Our Knowledge of the External World as a Field for Scientific Method in Philosophy — Bertrand Russell [2011]

5. Human, All Too Human: A Book for Free Spirits — Friedrich Wilhelm Nietzsche [2011]

6. History of Cleopatra, Queen of Egypt — Jacob Abbott [2012]

7. The Life of Ludwig van Beethoven, Volume I — Alexander Wheelock Thayer [2013]

8. Untitled — Unknown [2014]

9. Untitled — Unknown [2015]

10. Friedrich Nietzsche in seinen Werken — Lou Andreas-Salomé [2015]

11. The origin and development of the moral ideas — Edward Westermarck [2016]

12. The Joyful Wisdom ("La Gaya Scienza") — Friedrich Wilhelm Nietzsche [2016]

13. Enfranchisement of women — Harriet Hardy Taylor MillThe Project Gutenberg eBook of La Igualdad Social y Política y sus Relaciones con la Libertad [2016]

14. The Will to Power: An Attempted Transvaluation of All Values. Book III and IV — Friedrich Wilhelm Nietzsche [2016]

15. Shakspeare and His Times [Vol. 1 of 2] — Nathan Drake [2016]

16. The Intermediate Sex: A Study of Some Transitional Types of Men and Women — Edward Carpenter [2016]

17. A Complete History of Music — W. J. Baltzell [2017]

18. Cecilia of the Pink Roses — Katharine Haviland-Taylor [2019]

19. Fuente Ovejuna — Lope de Vega [2019]

20. Untitled — Unknown [2019]

21. Untitled — Unknown [2020]

22. Untitled — Unknown [2021]

23. A Short Treatise on Boots and Shoes, Ancient and Modern — Walter H. Goater [2021]

24. A Short Treatise on Head Wear, Ancient and Modern — Anne C. Goater [2021]

25. The Story of Milk — Johan Ditlev Frederiksen [2021]

26. Good Health and How We Won It, With an Account of the New Hygiene — Upton Sinclair [2021]

27. Foods and Their Adulteration — Harvey Washington Wiley [2021]

28. The Abergeldie Winter Book — Eléonore Riego de la Branchardière [2021]

29. The Origin, Tendencies and Principles of Government — Victoria C. Woodhull [2022]

On Liberty.

By John Stuart Mill.

With an Introduction by W. L. Courtney, LL.D.

The Walter Scott Publishing Co., Ltd. London and Felling-on-Tyne New York and Melbourne

To the beloved and deplored memory of her who was the inspirer, and in part the author, of all that is best in my writings--the friend and wife whose exalted sense of truth and right was my strongest incitement, and whose approbation was my chief reward--I dedicate this volume. Like all that I have written for many years, it belongs as much to her as to me; but the work as it stands has had, in a very insufficient degree, the inestimable advantage of her revision; some of the most important portions having been reserved for a more careful re-examination, which they are now never destined to receive. Were I but capable of interpreting to the world one-half the great thoughts and noble feelings which are buried in her grave, I should be the medium of a greater benefit to it than is ever likely to arise from anything that I can write, unprompted and unassisted by her all but unrivalled wisdom.

INTRODUCTION.

I.

John Stuart Mill was born on 20th May 1806. He was a delicate child, and the extraordinary education designed by his father was not calculated to develop and improve his physical powers. "I never was a boy," he says; "never played cricket." His exercise was taken in the form of walks with his father, during which the elder Mill lectured his son and examined him on his work. It is idle to speculate on the possible results of a different treatment. Mill remained delicate throughout his life, but was endowed with that intense mental energy which is so often combined with physical weakness. His youth was sacrificed to an idea; he was designed by his father to carry on his work; the individuality of the boy was unimportant. A visit to the south of France at the age of fourteen, in company with the family of General Sir Samuel Bentham, was not without its influence. It was a glimpse of another atmosphere, though the studious habits of his home life were maintained. Moreover, he derived from it his interest in foreign politics, which remained one of his characteristics to the end of his life. In 1823 he was appointed junior clerk in the Examiners' Office at the India House.

Mill's first essays were written in the _Traveller_ about a year before he entered the India House. From that time forward his literary work was uninterrupted save by attacks of illness. His industry was stupendous. He wrote articles on an infinite variety of subjects, political, metaphysical, philosophic, religious, poetical. He discovered Tennyson for his generation, he influenced the writing of Carlyle's _French Revolution_ as well as its success. And all the while he was engaged in studying and preparing for his more ambitious works, while he rose step by step at the India Office. His _Essays on Unsettled Questions in Political Economy_ were written in 1831, although they did not appear until thirteen years later. His _System of Logic_, the design of which was even then fashioning itself in his brain, took thirteen years to complete, and was actually published before the _Political Economy_. In 1844 appeared the article on Michelet, which its author anticipated would cause some discussion, but which did not create the sensation he expected. Next year there were the "Claims of Labour" and "Guizot," and in 1847 his articles on Irish affairs in the _Morning Chronicle_. These years were very much influenced by his friendship and correspondence with Comte, a curious comradeship between men of such different temperament. In 1848 Mill published his _Political Economy_, to which he had given his serious study since the completion of his _Logic_. His articles and reviews, though they involved a good deal of work--as, for instance, the re-perusal of the _Iliad_ and the _Odyssey_ in the original before reviewing Grote's _Greece_--were recreation to the student. The year 1856 saw him head of the Examiners' Office in the India House, and another two years brought the end of his official work, owing to the transfer of India to the Crown. In the same year his wife died. _Liberty_ was published shortly after, as well as the

Thoughts on Parliamentary Reform, and no year passed without Mill making important contributions on the political, philosophical, and ethical questions of the day.

Seven years after the death of his wife, Mill was invited to contest Westminster. His feeling on the conduct of elections made him refuse to take any personal action in the matter, and he gave the frankest expression to his political views, but nevertheless he was elected by a large majority. He was not a conventional success in the House; as a speaker he lacked magnetism. But his influence was widely felt. "For the sake of the House of Commons at large," said Mr. Gladstone, "I rejoiced in his advent and deplored his disappearance. He did us all good." After only three years in Parliament, he was defeated at the next General Election by Mr. W. H. Smith. He retired to Avignon, to the pleasant little house where the happiest years of his life had been spent in the companionship of his wife, and continued his disinterested labours. He completed his edition of his father's _Analysis of the Mind_, and also produced, in addition to less important work, _The Subjection of Women_, in which he had the active co-operation of his step-daughter. A book on Socialism was under consideration, but, like an earlier study of Sociology, it never was written. He died in 1873, his last years being spent peacefully in the pleasant society of his step-daughter, from whose tender care and earnest intellectual sympathy he caught maybe a far-off reflection of the light which had irradiated his spiritual life.

II.

The circumstances under which John Stuart Mill wrote his _Liberty_ are largely connected with the influence which Mrs. Taylor wielded over his career. The dedication is well known. It contains the most extraordinary panegyric on a woman that any philosopher has ever penned. "Were I but capable of interpreting to the world one-half the great thoughts and noble feelings which are buried in her grave, I should be the medium of a greater benefit to it than is ever likely to arise from anything that I can write, unprompted and unassisted by her all but unrivalled wisdom." It is easy for the ordinary worldly cynicism to curl a sceptical lip over sentences like these. There may be exaggeration of sentiment, the necessary and inevitable reaction of a man who was trained according to the "dry light" of so unimpressionable a man as James Mill, the father; but the passage quoted is not the only one in which John Stuart Mill proclaims his unhesitating belief in the intellectual influence of his wife. The treatise on _Liberty_ was written especially under her authority and encouragement, but there are many earlier references to the power which she exercised over his mind. Mill was introduced to her as early as 1831, at a dinner-party at Mr. Taylor's house, where were present, amongst others, Roebuck, W. J. Fox, and Miss Harriet Martineau. The acquaintance rapidly ripened into intimacy and the intimacy into friendship, and Mill was never weary of expatiating on all the advantages of so singular a relationship. In some of the presentation copies of his work on _Political Economy_, he wrote the following dedication:--"To Mrs. John Taylor, who, of all persons known to the author, is the most highly qualified either to originate or to appreciate speculation on social advancement, this work is with the highest respect and esteem dedicated." An article on the enfranchisement of women was made the occasion for another encomium. We shall hardly be wrong in attributing a much later book, _The Subjection of Women_, published in 1869, to the influence wielded by Mrs. Taylor. Finally, the pages of the _Autobiography_ ring with the dithyrambic praise of his "almost infallible counsellor."

The facts of this remarkable intimacy can easily be stated. The deductions are more difficult. There is no question that Mill's infatuation was the cause of considerable trouble to his acquaintances and friends. His father openly taxed him with being in love with another man's wife. Roebuck, Mrs. Grote, Mrs. Austin, Miss Harriet Martineau were amongst those who suffered because they made some allusion to a forbidden subject. Mrs. Taylor lived with her daughter in a lodging in the country; but in 1851 her husband died, and then Mill made her his wife. Opinions were widely divergent as to her merits; but every one agreed that up to the time of her death, in 1858, Mill was wholly lost to his friends. George Mill, one of Mill's younger brothers, gave it as his opinion that she was a clever and remarkable woman, but "nothing like what John took her to be." Carlyle, in his reminiscences, described her with ambiguous epithets. She was "vivid," "iridescent," "pale and passionate and sad-looking, a living-romance heroine of the royalist volition and questionable destiny." It is not possible to make much of a judgment like this, but we get on more certain ground when we discover that Mrs. Carlyle said on one occasion that "she is thought to be dangerous," and that Carlyle added that she was worse than dangerous, she was patronising. The occasion when Mill and his wife were brought into close contact with the Carlyles is well known. The manuscript of the first volume of the _French Revolution_ had been lent to Mill, and was accidentally burnt by Mrs. Mill's servant. Mill and his wife drove up to Carlyle's door, the wife speechless, the husband so full of conversation that he detained Carlyle with desperate attempts at loquacity for two hours. But Dr. Garnett tells us, in his _Life of Carlyle_, that Mill made a substantial reparation for the calamity for which he was responsible by inducing the aggrieved author to accept half of the L200 which he offered. Mrs. Mill, as I have said, died in 1858, after seven years of happy companionship with her husband, and was buried at Avignon. The inscription which Mill wrote for her grave is too characteristic to be omitted:--"Her great and loving heart, her noble soul, her clear, powerful, original, and comprehensive intellect, made her the guide and support, the instructor in wisdom and

the example in goodness, as she was the sole earthly delight of those who had the happiness to belong to her. As earnest for all public good as she was generous and devoted to all who surrounded her, her influence has been felt in many of the greatest improvements of the age, and will be in those still to come. Were there even a few hearts and intellects like hers, this earth would already become the hoped-for Heaven." These lines prove the intensity of Mill's feeling, which is not afraid of abundant verbiage; but they also prove that he could not imagine what the effect would be on others, and, as Grote said, only Mill's reputation could survive these and similar displays.

Every one will judge for himself of this romantic episode in Mill's career, according to such experience as he may possess of the philosophic mind and of the value of these curious but not infrequent relationships. It may have been a piece of infatuation, or, if we prefer to say so, it may have been the most gracious and the most human page in Mill's career. Mrs. Mill may have flattered her husband's vanity by echoing his opinions, or she may have indeed been an Egeria, full of inspiration and intellectual helpfulness. What usually happens in these cases,--although the philosopher himself, through his belief in the equality of the sexes, was debarred from thinking so,--is the extremely valuable action and reaction of two different classes and orders of mind. To any one whose thoughts have been occupied with the sphere of abstract speculation, the lively and vivid presentment of concrete fact comes as a delightful and agreeable shock. The instinct of the woman often enables her not only to apprehend but to illustrate a truth for which she would be totally unable to give the adequate philosophic reasoning. On the other hand, the man, with the more careful logical methods and the slow processes of formal reasoning, is apt to suppose that the happy intuition which leaps to the conclusion is really based on the intellectual processes of which he is conscious in his own case. Thus both parties to the happy contract are equally pleased. The abstract truth gets the concrete illustration; the concrete illustration finds its proper foundation in a series of abstract inquiries. Perhaps Carlyle's epithets of "iridescent" and "vivid" refer incidentally to Mrs. Mill's quick perceptiveness, and thus throw a useful light on the mutual advantages of the common work of husband and wife. But it savours almost of impertinence even to attempt to lift the veil on a mystery like this. It is enough to say, perhaps, that however much we may deplore the exaggeration of Mill's references to his wife, we recognise that, for whatever reason, the pair lived an ideally happy life.

It still, however, remains to estimate the extent to which Mrs. Taylor, both before and after her marriage with Mill, made actual contributions to his thoughts and his public work. Here I may be perhaps permitted to avail myself of what I have already written in a previous work.[1] Mill gives us abundant help in this matter in the _Autobiography_. When first he knew her, his thoughts were turning to the subject of Logic. But his published work on the subject owed nothing to her, he tells us, in its doctrines. It was Mill's custom to write the whole of a book so as to get his general scheme complete, and then laboriously to re-write it in order to perfect the phrases and the composition. Doubtless Mrs. Taylor was of considerable help to him as a critic of style. But to be a critic of doctrine she was hardly qualified. Mill has made some clear admissions on this point. "The only actual revolution which has ever taken place in my modes of thinking was already complete,"[2] he says, before her influence became paramount. There is a curiously humble estimate of his own powers (to which Dr. Bain has called attention), which reads at first sight as if it contradicted this. "During the greater part of my literary life I have performed the office in relation to her, which, from a rather early period, I had considered as the most useful part that I was qualified to take in the domain of thought, that of an interpreter of original thinkers, and mediator between them and the public." So far it would seem that Mill had sat at the feet of his oracle; but observe the highly remarkable exception which is made in the following sentence:--"For I had always a humble opinion of my own powers as an original thinker, _except in abstract science (logic, metaphysics, and the theoretic principles of political economy and politics.)_"[3] If Mill then was an original thinker in logic, metaphysics, and the science of economy and politics, it is clear that he had not learnt these from her lips. And to most men logic and metaphysics may be safely taken as forming a domain in which originality of thought, if it can be honestly professed, is a sufficient title of distinction.

Mrs. Taylor's assistance in the _Political Economy_ is confined to certain definite points. The purely scientific part was, we are assured, not learnt from her. "But it was chiefly her influence which gave to the book that general tone by which it is distinguished from all previous expositions of political economy that had any pretensions to be scientific, and which has made it so useful in conciliating minds which those previous expositions had repelled. This tone consisted chiefly in making the proper distinction between the laws of the production of wealth, which are real laws of Nature, dependent on the properties of objects, and the modes of its distribution, which, subject to certain conditions, depend on human will.... _I had indeed partially learnt this view of things from the thoughts awakened in me by the speculations of St. Simonians_; but it was made a living principle, pervading and animating the book, by my wife's promptings."[4] The part which is italicised is noticeable. Here, as elsewhere, Mill thinks out the matter by himself; the concrete form of the thoughts is suggested or prompted by the wife. Apart from this "general tone," Mill tells us that there was a specific contribution. "The chapter which has had a greater influence on opinion than all the rest, that on the Probable

Future of the Labouring Classes, is entirely due to her. In the first draft of the book that chapter did not exist. She pointed out the need of such a chapter, and the extreme imperfection of the book without it; she was the cause of my writing it." From this it would appear that she gave Mill that tendency to Socialism which, while it lends a progressive spirit to his speculations on politics, at the same time does not manifestly accord with his earlier advocacy of peasant proprietorships. Nor, again, is it, on the face of it, consistent with those doctrines of individual liberty which, aided by the intellectual companionship of his wife, he propounded in a later work. The ideal of individual freedom is not the ideal of Socialism, just as that invocation of governmental aid to which the Socialist resorts is not consistent with the theory of _laisser-faire_. Yet _Liberty_ was planned by Mill and his wife in concert. Perhaps a slight visionariness of speculation was no less the attribute of Mrs. Mill than an absence of rigid logical principles. Be this as it may, she undoubtedly checked the half-recognised leanings of her husband in the direction of Coleridge and Carlyle. Whether this was an instance of her steadying influence,[5] or whether it added one more unassimilated element to Mill's diverse intellectual sustenance, may be wisely left an open question. We cannot, however, be wrong in attributing to her the parentage of one book of Mill, _The Subjection of Women_. It is true that Mill had before learnt that men and women ought to be equal in legal, political, social, and domestic relations. This was a point on which he had already fallen foul of his father's essay on _Government_. But Mrs. Taylor had actually written on this very point, and the warmth and fervour of Mill's denunciations of women's servitude were unmistakably caught from his wife's view of the practical disabilities entailed by the feminine position.

III.

Liberty was published in 1859, when the nineteenth century was half over, but in its general spirit and in some of its special tendencies the little tract belongs rather to the standpoint of the eighteenth century than to that which saw its birth. In many of his speculations John Stuart Mill forms a sort of connecting link between the doctrines of the earlier English empirical school and those which we associate with the name of Mr. Herbert Spencer. In his _Logic_, for instance, he represents an advance on the theories of Hume, and yet does not see how profoundly the victories of Science modify the conclusions of the earlier thinker. Similarly, in his _Political Economy_, he desires to improve and to enlarge upon Ricardo, and yet does not advance so far as the modifications of political economy by Sociology, indicated by some later--and especially German--speculations on the subject. In the tract on _Liberty_, Mill is advocating the rights of the individual as against Society at the very opening of an era that was rapidly coming to the conclusion that the individual had no absolute rights against Society. The eighteenth century view is that individuals existed first, each with their own special claims and responsibilities; that they deliberately formed a Social State, either by a contract or otherwise; and that then finally they limited their own action out of regard for the interests of the social organism thus arbitrarily produced. This is hardly the view of the nineteenth century. It is possible that logically the individual is prior to the State; historically and in the order of Nature, the State is prior to the individual. In other words, such rights as every single personality possesses in a modern world do not belong to him by an original ordinance of Nature, but are slowly acquired in the growth and development of the social state. It is not the truth that individual liberties were forfeited by some deliberate act when men made themselves into a Commonwealth. It is more true to say, as Aristotle said long ago, that man is naturally a political animal, that he lived under strict social laws as a mere item, almost a nonentity, as compared with the Order, Society, or Community to which he belonged, and that such privileges as he subsequently acquired have been obtained in virtue of his growing importance as a member of a growing organisation. But if this is even approximately true, it seriously restricts that liberty of the individual for which Mill pleads. The individual has no chance, because he has no rights, against the social organism. Society can punish him for acts or even opinions which are anti-social in character. His virtue lies in recognising the intimate communion with his fellows. His sphere of activity is bounded by the common interest. Just as it is an absurd and exploded theory that all men are originally equal, so it is an ancient and false doctrine to protest that a man has an individual liberty to live and think as he chooses in any spirit of antagonism to that larger body of which he forms an insignificant part.

Nowadays this view of Society and of its development, which we largely owe to the _Philosophie Positive_ of M. Auguste Comte, is so familiar and possibly so damaging to the individual initiative, that it becomes necessary to advance and proclaim the truth which resides in an opposite theory. All progress, as we are aware, depends on the joint process of integration and differentiation; synthesis, analysis, and then a larger synthesis seem to form the law of development. If it ever comes to pass that Society is tyrannical in its restrictions of the individual, if, as for instance in some forms of Socialism, based on deceptive analogies of Nature's dealings, the type is everything and the individual nothing, it must be confidently urged in answer that the fuller life of the future depends on the manifold activities, even though they may be antagonistic, of the individual. In England, at all events, we know that government in all its different forms, whether as King, or as a caste of nobles, or as an oligarchical plutocracy, or even as trades unions, is so dwarfing in its action that, for the sake of the future, the individual must revolt. Just as our former point of view limited

the value of Mill's treatise on _Liberty_, so these considerations tend to show its eternal importance. The omnipotence of Society means a dead level of uniformity. The claim of the individual to be heard, to say what he likes, to do what he likes, to live as he likes, is absolutely necessary, not only for the variety of elements without which life is poor, but also for the hope of a future age. So long as individual initiative and effort are recognised as a vital element in English history, so long will Mill's _Liberty_, which he confesses was based on a suggestion derived from Von Humboldt, remain as an indispensable contribution to the speculations, and also to the health and sanity, of the world.

What his wife really was to Mill, we shall, perhaps, never know. But that she was an actual and vivid force, which roused the latent enthusiasm of his nature, we have abundant evidence. And when she died at Avignon, though his friends may have regained an almost estranged companionship, Mill was, personally, the poorer. Into the sorrow of that bereavement we cannot enter: we have no right or power to draw the veil. It is enough to quote the simple words, so eloquent of an unspoken grief--"I can say nothing which could describe, even in the faintest manner, what that loss was and is. But because I know that she would have wished it, I endeavour to make the best of what life I have left, and to work for her purposes with such diminished strength as can be derived from thoughts of her, and communion with her memory."

ON LIBERTY.

CHAPTER I.

INTRODUCTORY.

The subject of this Essay is not the so-called Liberty of the Will, so unfortunately opposed to the misnamed doctrine of Philosophical Necessity; but Civil, or Social Liberty: the nature and limits of the power which can be legitimately exercised by society over the individual. A question seldom stated, and hardly ever discussed, in general terms, but which profoundly influences the practical controversies of the age by its latent presence, and is likely soon to make itself recognised as the vital question of the future. It is so far from being new, that in a certain sense, it has divided mankind, almost from the remotest ages; but in the stage of progress into which the more civilised portions of the species have now entered, it presents itself under new conditions, and requires a different and more fundamental treatment.

The struggle between Liberty and Authority is the most conspicuous feature in the portions of history with which we are earliest familiar, particularly in that of Greece, Rome, and England. But in old times this contest was between subjects, or some classes of subjects, and the government. By liberty, was meant protection against the tyranny of the political rulers. The rulers were conceived (except in some of the popular governments of Greece) as in a necessarily antagonistic position to the people whom they ruled. They consisted of a governing One, or a governing tribe or caste, who derived their authority from inheritance or conquest, who, at all events, did not hold it at the pleasure of the governed, and whose supremacy men did not venture, perhaps did not desire, to contest, whatever precautions might be taken against its oppressive exercise. Their power was regarded as necessary, but also as highly dangerous; as a weapon which they would attempt to use against their subjects, no less than against external enemies. To prevent the weaker members of the community from being preyed upon by innumerable vultures, it was needful that there should be an animal of prey stronger than the rest, commissioned to keep them down. But as the king of the vultures would be no less bent upon preying on the flock than any of the minor harpies, it was indispensable to be in a perpetual attitude of defence against his beak and claws. The aim, therefore, of patriots, was to set limits to the power which the ruler should be suffered to exercise over the community; and this limitation was what they meant by liberty. It was attempted in two ways. First, by obtaining a recognition of certain immunities, called political liberties or rights, which it was to be regarded as a breach of duty in the ruler to infringe, and which if he did infringe, specific resistance, or general rebellion, was held to be justifiable. A second, and generally a later expedient, was the establishment of constitutional checks; by which the consent of the community, or of a body of some sort, supposed to represent its interests, was made a necessary condition to some of the more important acts of the governing power. To the first of these modes of limitation, the ruling power, in most European countries, was compelled, more or less, to submit. It was not so with the second; and to attain this, or when already in some degree possessed, to attain it more completely, became everywhere the principal object of the lovers of liberty. And so long as mankind were content to combat one enemy by another, and to be ruled by a master, on condition of being guaranteed more or less efficaciously against his tyranny, they did not carry their aspirations beyond this point.

A time, however, came, in the progress of human affairs, when men ceased to think it a necessity of nature that their governors should be an independent power, opposed in interest to themselves. It appeared to them much better that the various magistrates of the State should be their tenants or delegates, revocable at their pleasure. In that way alone, it seemed, could they have complete security that the powers of government would never be abused to their disadvantage. By degrees, this new demand for elective and temporary rulers became the prominent object of the exertions of the popular party, wherever any such party existed; and superseded, to a considerable extent, the previous efforts to limit the power of rulers. As the struggle proceeded for making the ruling power emanate from the periodical choice of the ruled, some persons began to think that too much importance had been attached to the limitation of the power itself. _That_ (it might seem) was a resource against rulers whose interests were habitually opposed to those of the people. What was now wanted was, that the rulers should be identified with the people; that their interest and will should be the interest and will of the nation. The nation did not need to be protected against its own will. There was no fear of its tyrannising over itself. Let the rulers be effectually responsible to it, promptly removable by it, and it could afford to trust them with power of which it could itself dictate the use to be made. Their power was but the nation's own power, concentrated, and in a form convenient for exercise. This mode of thought, or rather perhaps of feeling, was common among the last generation of European liberalism, in the Continental section of which it still apparently predominates. Those who admit any limit to what a government may do, except in the case of such governments as they think ought not to exist, stand out as brilliant exceptions among the political thinkers of the Continent. A similar tone of sentiment might by this time have been prevalent in our own country, if the circumstances which for a time encouraged it, had continued unaltered.

But, in political and philosophical theories, as well as in persons, success discloses faults and infirmities which failure might have concealed from observation. The notion, that the people have no need to limit their power over themselves, might seem axiomatic,

when popular government was a thing only dreamed about, or read of as having existed at some distant period of the past. Neither was that notion necessarily disturbed by such temporary aberrations as those of the French Revolution, the worst of which were the work of a usurping few, and which, in any case, belonged, not to the permanent working of popular institutions, but to a sudden and convulsive outbreak against monarchical and aristocratic despotism. In time, however, a democratic republic came to occupy a large portion of the earth's surface, and made itself felt as one of the most powerful members of the community of nations; and elective and responsible government became subject to the observations and criticisms which wait upon a great existing fact. It was now perceived that such phrases as "self-government," and "the power of the people over themselves," do not express the true state of the case. The "people" who exercise the power are not always the same people with those over whom it is exercised; and the "self-government" spoken of is not the government of each by himself, but of each by all the rest. The will of the people, moreover, practically means, the will of the most numerous or the most active _part_ of the people; the majority, or those who succeed in making themselves accepted as the majority: the people, consequently, _may_ desire to oppress a part of their number; and precautions are as much needed against this, as against any other abuse of power. The limitation, therefore, of the power of government over individuals, loses none of its importance when the holders of power are regularly accountable to the community, that is, to the strongest party therein. This view of things, recommending itself equally to the intelligence of thinkers and to the inclination of those important classes in European society to whose real or supposed interests democracy is adverse, has had no difficulty in establishing itself; and in political speculations "the tyranny of the majority" is now generally included among the evils against which society requires to be on its guard.

Like other tyrannies, the tyranny of the majority was at first, and is still vulgarly, held in dread, chiefly as operating through the acts of the public authorities. But reflecting persons perceived that when society is itself the tyrant--society collectively, over the separate individuals who compose it--its means of tyrannising are not restricted to the acts which it may do by the hands of its political functionaries. Society can and does execute its own mandates: and if it issues wrong mandates instead of right, or any mandates at all in things with which it ought not to meddle, it practises a social tyranny more formidable than many kinds of political oppression, since, though not usually upheld by such extreme penalties, it leaves fewer means of escape, penetrating much more deeply into the details of life, and enslaving the soul itself. Protection, therefore, against the tyranny of the magistrate is not enough: there needs protection also against the tyranny of the prevailing opinion and feeling; against the tendency of society to impose, by other means than civil penalties, its own ideas and practices as rules of conduct on those who dissent from them; to fetter the development, and, if possible, prevent the formation, of any individuality not in harmony with its ways, and compel all characters to fashion themselves upon the model of its own. There is a limit to the legitimate interference of collective opinion with individual independence: and to find that limit, and maintain it against encroachment, is as indispensable to a good condition of human affairs, as protection against political despotism.

But though this proposition is not likely to be contested in general terms, the practical question, where to place the limit--how to make the fitting adjustment between individual independence and social control--is a subject on which nearly everything remains to be done. All that makes existence valuable to any one, depends on the enforcement of restraints upon the actions of other people. Some rules of conduct, therefore, must be imposed, by law in the first place, and by opinion on many things which are not fit subjects for the operation of law. What these rules should be, is the principal question in human affairs; but if we except a few of the most obvious cases, it is one of those which least progress has been made in resolving. No two ages, and scarcely any two countries, have decided it alike; and the decision of one age or country is a wonder to another. Yet the people of any given age and country no more suspect any difficulty in it, than if it were a subject on which mankind had always been agreed. The rules which obtain among themselves appear to them self-evident and self-justifying. This all but universal illusion is one of the examples of the magical influence of custom, which is not only, as the proverb says, a second nature, but is continually mistaken for the first. The effect of custom, in preventing any misgiving respecting the rules of conduct which mankind impose on one another, is all the more complete because the subject is one on which it is not generally considered necessary that reasons should be given, either by one person to others, or by each to himself. People are accustomed to believe, and have been encouraged in the belief by some who aspire to the character of philosophers, that their feelings, on subjects of this nature, are better than reasons, and render reasons unnecessary. The practical principle which guides them to their opinions on the regulation of human conduct, is the feeling in each person's mind that everybody should be required to act as he, and those with whom he sympathises, would like them to act. No one, indeed, acknowledges to himself that his standard of judgment is his own liking; but an opinion on a point of conduct, not supported by reasons, can only count as one person's preference; and if the reasons, when given, are a mere appeal to a similar preference felt by other people, it is still only many people's liking instead of one. To an ordinary man, however, his own preference, thus supported, is not only a perfectly satisfactory reason, but the only one he generally has for any of his notions of morality, taste,

or propriety, which are not expressly written in his religious creed; and his chief guide in the interpretation even of that. Men's opinions, accordingly, on what is laudable or blamable, are affected by all the multifarious causes which influence their wishes in regard to the conduct of others, and which are as numerous as those which determine their wishes on any other subject. Sometimes their reason--at other times their prejudices or superstitions: often their social affections, not seldom their anti-social ones, their envy or jealousy, their arrogance or contemptuousness: but most commonly, their desires or fears for themselves--their legitimate or illegitimate self-interest. Wherever there is an ascendant class, a large portion of the morality of the country emanates from its class interests, and its feelings of class superiority. The morality between Spartans and Helots, between planters and negroes, between princes and subjects, between nobles and roturiers, between men and women, has been for the most part the creation of these class interests and feelings: and the sentiments thus generated, react in turn upon the moral feelings of the members of the ascendant class, in their relations among themselves. Where, on the other hand, a class, formerly ascendant, has lost its ascendancy, or where its ascendancy is unpopular, the prevailing moral sentiments frequently bear the impress of an impatient dislike of superiority. Another grand determining principle of the rules of conduct, both in act and forbearance, which have been enforced by law or opinion, has been the servility of mankind towards the supposed preferences or aversions of their temporal masters, or of their gods. This servility, though essentially selfish, is not hypocrisy; it gives rise to perfectly genuine sentiments of abhorrence; it made men burn magicians and heretics. Among so many baser influences, the general and obvious interests of society have of course had a share, and a large one, in the direction of the moral sentiments: less, however, as a matter of reason, and on their own account, than as a consequence of the sympathies and antipathies which grew out of them: and sympathies and antipathies which had little or nothing to do with the interests of society, have made themselves felt in the establishment of moralities with quite as great force.

The likings and dislikings of society, or of some powerful portion of it, are thus the main thing which has practically determined the rules laid down for general observance, under the penalties of law or opinion. And in general, those who have been in advance of society in thought and feeling have left this condition of things unassailed in principle, however they may have come into conflict with it in some of its details. They have occupied themselves rather in inquiring what things society ought to like or dislike, than in questioning whether its likings or dislikings should be a law to individuals. They preferred endeavouring to alter the feelings of mankind on the particular points on which they were themselves heretical, rather than make common cause in defence of freedom, with heretics generally. The only case in which the higher ground has been taken on principle and maintained with consistency, by any but an individual here and there, is that of religious belief: a case instructive in many ways, and not least so as forming a most striking instance of the fallibility of what is called the moral sense: for the _odium theologicum_, in a sincere bigot, is one of the most unequivocal cases of moral feeling. Those who first broke the yoke of what called itself the Universal Church, were in general as little willing to permit difference of religious opinion as that church itself. But when the heat of the conflict was over, without giving a complete victory to any party, and each church or sect was reduced to limit its hopes to retaining possession of the ground it already occupied; minorities, seeing that they had no chance of becoming majorities, were under the necessity of pleading to those whom they could not convert, for permission to differ. It is accordingly on this battle-field, almost solely, that the rights of the individual against society have been asserted on broad grounds of principle, and the claim of society to exercise authority over dissentients, openly controverted. The great writers to whom the world owes what religious liberty it possesses, have mostly asserted freedom of conscience as an indefeasible right, and denied absolutely that a human being is accountable to others for his religious belief. Yet so natural to mankind is intolerance in whatever they really care about, that religious freedom has hardly anywhere been practically realised, except where religious indifference, which dislikes to have its peace disturbed by theological quarrels, has added its weight to the scale. In the minds of almost all religious persons, even in the most tolerant countries, the duty of toleration is admitted with tacit reserves. One person will bear with dissent in matters of church government, but not of dogma; another can tolerate everybody, short of a Papist or a Unitarian; another, every one who believes in revealed religion; a few extend their charity a little further, but stop at the belief in a God and in a future state. Wherever the sentiment of the majority is still genuine and intense, it is found to have abated little of its claim to be obeyed.

In England, from the peculiar circumstances of our political history, though the yoke of opinion is perhaps heavier, that of law is lighter, than in most other countries of Europe; and there is considerable jealousy of direct interference, by the legislative or the executive power, with private conduct; not so much from any just regard for the independence of the individual, as from the still subsisting habit of looking on the government as representing an opposite interest to the public. The majority have not yet learnt to feel the power of the government their power, or its opinions their opinions. When they do so, individual liberty will probably be as much exposed to invasion from the government, as it already is from public opinion. But, as yet, there is a considerable amount of feeling ready to be called forth against any attempt of the law to control individuals in things in which they have not hitherto been

accustomed to be controlled by it; and this with very little discrimination as to whether the matter is, or is not, within the legitimate sphere of legal control; insomuch that the feeling, highly salutary on the whole, is perhaps quite as often misplaced as well grounded in the particular instances of its application. There is, in fact, no recognised principle by which the propriety or impropriety of government interference is customarily tested. People decide according to their personal preferences. Some, whenever they see any good to be done, or evil to be remedied, would willingly instigate the government to undertake the business; while others prefer to bear almost any amount of social evil, rather than add one to the departments of human interests amenable to governmental control. And men range themselves on one or the other side in any particular case, according to this general direction of their sentiments; or according to the degree of interest which they feel in the particular thing which it is proposed that the government should do, or according to the belief they entertain that the government would, or would not, do it in the manner they prefer; but very rarely on account of any opinion to which they consistently adhere, as to what things are fit to be done by a government. And it seems to me that in consequence of this absence of rule or principle, one side is at present as often wrong as the other; the interference of government is, with about equal frequency, improperly invoked and improperly condemned.

The object of this Essay is to assert one very simple principle, as entitled to govern absolutely the dealings of society with the individual in the way of compulsion and control, whether the means used be physical force in the form of legal penalties, or the moral coercion of public opinion. That principle is, that the sole end for which mankind are warranted, individually or collectively, in interfering with the liberty of action of any of their number, is self-protection. That the only purpose for which power can be rightfully exercised over any member of a civilised community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant. He cannot rightfully be compelled to do or forbear because it will be better for him to do so, because it will make him happier, because, in the opinions of others, to do so would be wise, or even right. These are good reasons for remonstrating with him, or reasoning with him, or persuading him, or entreating him, but not for compelling him, or visiting him with any evil in case he do otherwise. To justify that, the conduct from which it is desired to deter him must be calculated to produce evil to some one else. The only part of the conduct of any one, for which he is amenable to society, is that which concerns others. In the part which merely concerns himself, his independence is, of right, absolute. Over himself, over his own body and mind, the individual is sovereign.

It is, perhaps, hardly necessary to say that this doctrine is meant to apply only to human beings in the maturity of their faculties. We are not speaking of children, or of young persons below the age which the law may fix as that of manhood or womanhood. Those who are still in a state to require being taken care of by others, must be protected against their own actions as well as against external injury. For the same reason, we may leave out of consideration those backward states of society in which the race itself may be considered as in its nonage. The early difficulties in the way of spontaneous progress are so great, that there is seldom any choice of means for overcoming them; and a ruler full of the spirit of improvement is warranted in the use of any expedients that will attain an end, perhaps otherwise unattainable. Despotism is a legitimate mode of government in dealing with barbarians, provided the end be their improvement, and the means justified by actually effecting that end. Liberty, as a principle, has no application to any state of things anterior to the time when mankind have become capable of being improved by free and equal discussion. Until then, there is nothing for them but implicit obedience to an Akbar or a Charlemagne, if they are so fortunate as to find one. But as soon as mankind have attained the capacity of being guided to their own improvement by conviction or persuasion (a period long since reached in all nations with whom we need here concern ourselves), compulsion, either in the direct form or in that of pains and penalties for non-compliance, is no longer admissible as a means to their own good, and justifiable only for the security of others.

It is proper to state that I forego any advantage which could be derived to my argument from the idea of abstract right, as a thing independent of utility. I regard utility as the ultimate appeal on all ethical questions; but it must be utility in the largest sense, grounded on the permanent interests of man as a progressive being. Those interests, I contend, authorise the subjection of individual spontaneity to external control, only in respect to those actions of each, which concern the interest of other people. If any one does an act hurtful to others, there is a _prima facie_ case for punishing him, by law, or, where legal penalties are not safely applicable, by general disapprobation. There are also many positive acts for the benefit of others, which he may rightfully be compelled to perform; such as, to give evidence in a court of justice; to bear his fair share in the common defence, or in any other joint work necessary to the interest of the society of which he enjoys the protection; and to perform certain acts of individual beneficence, such as saving a fellow-creature's life, or interposing to protect the defenceless against ill-usage, things which whenever it is obviously a man's duty to do, he may rightfully be made responsible to society for not doing. A person may cause evil to others not only by his actions but by his inaction, and in either case he is justly accountable to them for the injury. The latter case, it is true, requires a much more cautious exercise of compulsion than the former. To make any one answerable for doing evil to

others, is the rule; to make him answerable for not preventing evil, is, comparatively speaking, the exception. Yet there are many cases clear enough and grave enough to justify that exception. In all things which regard the external relations of the individual, he is _de jure_ amenable to those whose interests are concerned, and if need be, to society as their protector. There are often good reasons for not holding him to the responsibility; but these reasons must arise from the special expediencies of the case: either because it is a kind of case in which he is on the whole likely to act better, when left to his own discretion, than when controlled in any way in which society have it in their power to control him; or because the attempt to exercise control would produce other evils, greater than those which it would prevent. When such reasons as these preclude the enforcement of responsibility, the conscience of the agent himself should step into the vacant judgment seat, and protect those interests of others which have no external protection; judging himself all the more rigidly, because the case does not admit of his being made accountable to the judgment of his fellow-creatures.

But there is a sphere of action in which society, as distinguished from the individual, has, if any, only an indirect interest; comprehending all that portion of a person's life and conduct which affects only himself, or if it also affects others, only with their free, voluntary, and undeceived consent and participation. When I say only himself, I mean directly, and in the first instance: for whatever affects himself, may affect others _through_ himself; and the objection which may be grounded on this contingency, will receive consideration in the sequel. This, then, is the appropriate region of human liberty. It comprises, first, the inward domain of consciousness; demanding liberty of conscience, in the most comprehensive sense; liberty of thought and feeling; absolute freedom of opinion and sentiment on all subjects, practical or speculative, scientific, moral, or theological. The liberty of expressing and publishing opinions may seem to fall under a different principle, since it belongs to that part of the conduct of an individual which concerns other people; but, being almost of as much importance as the liberty of thought itself, and resting in great part on the same reasons, is practically inseparable from it. Secondly, the principle requires liberty of tastes and pursuits; of framing the plan of our life to suit our own character; of doing as we like, subject to such consequences as may follow: without impediment from our fellow-creatures, so long as what we do does not harm them, even though they should think our conduct foolish, perverse, or wrong. Thirdly, from this liberty of each individual, follows the liberty, within the same limits, of combination among individuals; freedom to unite, for any purpose not involving harm to others: the persons combining being supposed to be of full age, and not forced or deceived.

No society in which these liberties are not, on the whole, respected, is free, whatever may be its form of government; and none is completely free in which they do not exist absolute and unqualified. The only freedom which deserves the name, is that of pursuing our own good in our own way, so long as we do not attempt to deprive others of theirs, or impede their efforts to obtain it. Each is the proper guardian of his own health, whether bodily, or mental and spiritual. Mankind are greater gainers by suffering each other to live as seems good to themselves, than by compelling each to live as seems good to the rest.

Though this doctrine is anything but new, and, to some persons, may have the air of a truism, there is no doctrine which stands more directly opposed to the general tendency of existing opinion and practice. Society has expended fully as much effort in the attempt (according to its lights) to compel people to conform to its notions of personal, as of social excellence. The ancient commonwealths thought themselves entitled to practise, and the ancient philosophers countenanced, the regulation of every part of private conduct by public authority, on the ground that the State had a deep interest in the whole bodily and mental discipline of every one of its citizens; a mode of thinking which may have been admissible in small republics surrounded by powerful enemies, in constant peril of being subverted by foreign attack or internal commotion, and to which even a short interval of relaxed energy and self-command might so easily be fatal, that they could not afford to wait for the salutary permanent effects of freedom. In the modern world, the greater size of political communities, and above all, the separation between spiritual and temporal authority (which placed the direction of men's consciences in other hands than those which controlled their worldly affairs), prevented so great an interference by law in the details of private life; but the engines of moral repression have been wielded more strenuously against divergence from the reigning opinion in self-regarding, than even in social matters; religion, the most powerful of the elements which have entered into the formation of moral feeling, having almost always been governed either by the ambition of a hierarchy, seeking control over every department of human conduct, or by the spirit of Puritanism. And some of those modern reformers who have placed themselves in strongest opposition to the religions of the past, have been noway behind either churches or sects in their assertion of the right of spiritual domination: M. Comte, in particular, whose social system, as unfolded in his _Traite de Politique Positive_, aims at establishing (though by moral more than by legal appliances) a despotism of society over the individual, surpassing anything contemplated in the political ideal of the most rigid disciplinarian among the ancient philosophers.

Apart from the peculiar tenets of individual thinkers, there is also in the world at large an increasing inclination to stretch unduly the powers of society over the individual, both by the force of opinion and even by that of legislation: and as the tendency of all the changes taking place in the world is to strengthen society, and diminish the power of the individual, this encroachment is not one of the evils which tend spontaneously to disappear, but, on the contrary, to grow more and more formidable. The disposition of mankind, whether as rulers or as fellow-citizens to impose their own opinions and inclinations as a rule of conduct on others, is so energetically supported by some of the best and by some of the worst feelings incident to human nature, that it is hardly ever kept under restraint by anything but want of power; and as the power is not declining, but growing, unless a strong barrier of moral conviction can be raised against the mischief, we must expect, in the present circumstances of the world, to see it increase.

It will be convenient for the argument, if, instead of at once entering upon the general thesis, we confine ourselves in the first instance to a single branch of it, on which the principle here stated is, if not fully, yet to a certain point, recognised by the current opinions. This one branch is the Liberty of Thought: from which it is impossible to separate the cognate liberty of speaking and of writing. Although these liberties, to some considerable amount, form part of the political morality of all countries which profess religious toleration and free institutions, the grounds, both philosophical and practical, on which they rest, are perhaps not so familiar to the general mind, nor so thoroughly appreciated by many even of the leaders of opinion, as might have been expected. Those grounds, when rightly understood, are of much wider application than to only one division of the subject, and a thorough consideration of this part of the question will be found the best introduction to the remainder. Those to whom nothing which I am about to say will be new, may therefore, I hope, excuse me, if on a subject which for now three centuries has been so often discussed, I venture on one discussion more.

CHAPTER II.

OF THE LIBERTY OF THOUGHT AND DISCUSSION.

The time, it is to be hoped, is gone by, when any defence would be necessary of the "liberty of the press" as one of the securities against corrupt or tyrannical government. No argument, we may suppose, can now be needed, against permitting a legislature or an executive, not identified in interest with the people, to prescribe opinions to them, and determine what doctrines or what arguments they shall be allowed to hear. This aspect of the question, besides, has been so often and so triumphantly enforced by preceding writers, that it need not be specially insisted on in this place. Though the law of England, on the subject of the press, is as servile to this day as it was in the time of the Tudors, there is little danger of its being actually put in force against political discussion, except during some temporary panic, when fear of insurrection drives ministers and judges from their propriety;[6] and, speaking generally, it is not, in constitutional countries, to be apprehended that the government, whether completely responsible to the people or not, will often attempt to control the expression of opinion, except when in doing so it makes itself the organ of the general intolerance of the public. Let us suppose, therefore, that the government is entirely at one with the people, and never thinks of exerting any power of coercion unless in agreement with what it conceives to be their voice. But I deny the right of the people to exercise such coercion, either by themselves or by their government. The power itself is illegitimate. The best government has no more title to it than the worst. It is as noxious, or more noxious, when exerted in accordance with public opinion, than when in or opposition to it. If all mankind minus one, were of one opinion, and only one person were of the contrary opinion, mankind would be no more justified in silencing that one person, than he, if he had the power, would be justified in silencing mankind. Were an opinion a personal possession of no value except to the owner; if to be obstructed in the enjoyment of it were simply a private injury, it would make some difference whether the injury was inflicted only on a few persons or on many. But the peculiar evil of silencing the expression of an opinion is, that it is robbing the human race; posterity as well as the existing generation; those who dissent from the opinion, still more than those who hold it. If the opinion is right, they are deprived of the opportunity of exchanging error for truth: if wrong, they lose, what is almost as great a benefit, the clearer perception and livelier impression of truth, produced by its collision with error.

It is necessary to consider separately these two hypotheses, each of which has a distinct branch of the argument corresponding to it. We can never be sure that the opinion we are endeavouring to stifle is a false opinion; and if we were sure, stifling it would be an evil still.

First: the opinion which it is attempted to suppress by authority may possibly be true. Those who desire to suppress it, of course deny its truth; but they are not infallible. They have no authority to decide the question for all mankind, and exclude every other person from the means of judging. To refuse a hearing to an opinion, because they are sure that it is false, is to assume that _their_

certainty is the same thing as _absolute_ certainty. All silencing of discussion is an assumption of infallibility. Its condemnation may be allowed to rest on this common argument, not the worse for being common.

Unfortunately for the good sense of mankind, the fact of their fallibility is far from carrying the weight in their practical judgment, which is always allowed to it in theory; for while every one well knows himself to be fallible, few think it necessary to take any precautions against their own fallibility, or admit the supposition that any opinion, of which they feel very certain, may be one of the examples of the error to which they acknowledge themselves to be liable. Absolute princes, or others who are accustomed to unlimited deference, usually feel this complete confidence in their own opinions on nearly all subjects. People more happily situated, who sometimes hear their opinions disputed, and are not wholly unused to be set right when they are wrong, place the same unbounded reliance only on such of their opinions as are shared by all who surround them, or to whom they habitually defer: for in proportion to a man's want of confidence in his own solitary judgment, does he usually repose, with implicit trust, on the infallibility of "the world" in general. And the world, to each individual, means the part of it with which he comes in contact; his party, his sect, his church, his class of society: the man may be called, by comparison, almost liberal and large-minded to whom it means anything so comprehensive as his own country or his own age. Nor is his faith in this collective authority at all shaken by his being aware that other ages, countries, sects, churches, classes, and parties have thought, and even now think, the exact reverse. He devolves upon his own world the responsibility of being in the right against the dissentient worlds of other people; and it never troubles him that mere accident has decided which of these numerous worlds is the object of his reliance, and that the same causes which make him a Churchman in London, would have made him a Buddhist or a Confucian in Pekin. Yet it is as evident in itself as any amount of argument can make it, that ages are no more infallible than individuals; every age having held many opinions which subsequent ages have deemed not only false but absurd; and it is as certain that many opinions, now general, will be rejected by future ages, as it is that many, once general, are rejected by the present.

The objection likely to be made to this argument, would probably take some such form as the following. There is no greater assumption of infallibility in forbidding the propagation of error, than in any other thing which is done by public authority on its own judgment and responsibility. Judgment is given to men that they may use it. Because it may be used erroneously, are men to be told that they ought not to use it at all? To prohibit what they think pernicious, is not claiming exemption from error, but fulfilling the duty incumbent on them, although fallible, of acting on their conscientious conviction. If we were never to act on our opinions, because those opinions may be wrong, we should leave all our interests uncared for, and all our duties unperformed. An objection which applies to all conduct, can be no valid objection to any conduct in particular. It is the duty of governments, and of individuals, to form the truest opinions they can; to form them carefully, and never impose them upon others unless they are quite sure of being right. But when they are sure (such reasoners may say), it is not conscientiousness but cowardice to shrink from acting on their opinions, and allow doctrines which they honestly think dangerous to the welfare of mankind, either in this life or in another, to be scattered abroad without restraint, because other people, in less enlightened times, have persecuted opinions now believed to be true. Let us take care, it may be said, not to make the same mistake: but governments and nations have made mistakes in other things, which are not denied to be fit subjects for the exercise of authority: they have laid on bad taxes, made unjust wars. Ought we therefore to lay on no taxes, and, under whatever provocation, make no wars? Men, and governments, must act to the best of their ability. There is no such thing as absolute certainty, but there is assurance sufficient for the purposes of human life. We may, and must, assume our opinion to be true for the guidance of our own conduct: and it is assuming no more when we forbid bad men to pervert society by the propagation of opinions which we regard as false and pernicious.

I answer that it is assuming very much more. There is the greatest difference between presuming an opinion to be true, because, with every opportunity for contesting it, it has not been refuted, and assuming its truth for the purpose of not permitting its refutation. Complete liberty of contradicting and disproving our opinion, is the very condition which justifies us in assuming its truth for purposes of action; and on no other terms can a being with human faculties have any rational assurance of being right.

When we consider either the history of opinion, or the ordinary conduct of human life, to what is it to be ascribed that the one and the other are no worse than they are? Not certainly to the inherent force of the human understanding; for, on any matter not self-evident, there are ninety-nine persons totally incapable of judging of it, for one who is capable; and the capacity of the hundredth person is only comparative; for the majority of the eminent men of every past generation held many opinions now known to be erroneous, and did or approved numerous things which no one will now justify. Why is it, then, that there is on the whole a preponderance among mankind of rational opinions and rational conduct? If there really is this preponderance--which there must be, unless human affairs are, and have always been, in an almost desperate state--it is owing to a quality of the human mind, the source of everything respectable in man either as an intellectual or as a moral being, namely, that his errors are corrigible. He is

capable of rectifying his mistakes, by discussion and experience. Not by experience alone. There must be discussion, to show how experience is to be interpreted. Wrong opinions and practices gradually yield to fact and argument: but facts and arguments, to produce any effect on the mind, must be brought before it. Very few facts are able to tell their own story, without comments to bring out their meaning. The whole strength and value, then, of human judgment, depending on the one property, that it can be set right when it is wrong, reliance can be placed on it only when the means of setting it right are kept constantly at hand. In the case of any person whose judgment is really deserving of confidence, how has it become so? Because he has kept his mind open to criticism of his opinions and conduct. Because it has been his practice to listen to all that could be said against him; to profit by as much of it as was just, and expound to himself, and upon occasion to others, the fallacy of what was fallacious. Because he has felt, that the only way in which a human being can make some approach to knowing the whole of a subject, is by hearing what can be said about it by persons of every variety of opinion, and studying all modes in which it can be looked at by every character of mind. No wise man ever acquired his wisdom in any mode but this; nor is it in the nature of human intellect to become wise in any other manner. The steady habit of correcting and completing his own opinion by collating it with those of others, so far from causing doubt and hesitation in carrying it into practice, is the only stable foundation for a just reliance on it: for, being cognisant of all that can, at least obviously, be said against him, and having taken up his position against all gainsayers--knowing that he has sought for objections and difficulties, instead of avoiding them, and has shut out no light which can be thrown upon the subject from any quarter--he has a right to think his judgment better than that of any person, or any multitude, who have not gone through a similar process.

It is not too much to require that what the wisest of mankind, those who are best entitled to trust their own judgment, find necessary to warrant their relying on it, should be submitted to by that miscellaneous collection of a few wise and many foolish individuals, called the public. The most intolerant of churches, the Roman Catholic Church, even at the canonisation of a saint, admits, and listens patiently to, a "devil's advocate." The holiest of men, it appears, cannot be admitted to posthumous honours, until all that the devil could say against him is known and weighed. If even the Newtonian philosophy were not permitted to be questioned, mankind could not feel as complete assurance of its truth as they now do. The beliefs which we have most warrant for, have no safeguard to rest on, but a standing invitation to the whole world to prove them unfounded. If the challenge is not accepted, or is accepted and the attempt fails, we are far enough from certainty still; but we have done the best that the existing state of human reason admits of; we have neglected nothing that could give the truth a chance of reaching us: if the lists are kept open, we may hope that if there be a better truth, it will be found when the human mind is capable of receiving it; and in the meantime we may rely on having attained such approach to truth, as is possible in our own day. This is the amount of certainty attainable by a fallible being, and this the sole way of attaining it.

Strange it is, that men should admit the validity of the arguments for free discussion, but object to their being "pushed to an extreme;" not seeing that unless the reasons are good for an extreme case, they are not good for any case. Strange that they should imagine that they are not assuming infallibility, when they acknowledge that there should be free discussion on all subjects which can possibly be _doubtful_, but think that some particular principle or doctrine should be forbidden to be questioned because it is _so certain_, that is, because _they are certain_ that it is certain. To call any proposition certain, while there is any one who would deny its certainty if permitted, but who is not permitted, is to assume that we ourselves, and those who agree with us, are the judges of certainty, and judges without hearing the other side.

In the present age--which has been described as "destitute of faith, but terrified at scepticism"--in which people feel sure, not so much that their opinions are true, as that they should not know what to do without them--the claims of an opinion to be protected from public attack are rested not so much on its truth, as on its importance to society. There are, it is alleged, certain beliefs, so useful, not to say indispensable to well-being, that it is as much the duty of governments to uphold those beliefs, as to protect any other of the interests of society. In a case of such necessity, and so directly in the line of their duty, something less than infallibility may, it is maintained, warrant, and even bind, governments, to act on their own opinion, confirmed by the general opinion of mankind. It is also often argued, and still oftener thought, that none but bad men would desire to weaken these salutary beliefs; and there can be nothing wrong, it is thought, in restraining bad men, and prohibiting what only such men would wish to practise. This mode of thinking makes the justification of restraints on discussion not a question of the truth of doctrines, but of their usefulness; and flatters itself by that means to escape the responsibility of claiming to be an infallible judge of opinions. But those who thus satisfy themselves, do not perceive that the assumption of infallibility is merely shifted from one point to another. The usefulness of an opinion is itself matter of opinion: as disputable, as open to discussion, and requiring discussion as much, as the opinion itself. There is the same need of an infallible judge of opinions to decide an opinion to be noxious, as to decide it to be false, unless the opinion condemned has full opportunity of defending itself. And it will not do to say that the heretic may be allowed to maintain the utility or harmlessness of his opinion, though forbidden to maintain its truth. The truth of an opinion is part of its utility. If we would

know whether or not it is desirable that a proposition should be believed, is it possible to exclude the consideration of whether or not it is true? In the opinion, not of bad men, but of the best men, no belief which is contrary to truth can be really useful: and can you prevent such men from urging that plea, when they are charged with culpability for denying some doctrine which they are told is useful, but which they believe to be false? Those who are on the side of received opinions, never fail to take all possible advantage of this plea; you do not find _them_ handling the question of utility as if it could be completely abstracted from that of truth: on the contrary, it is, above all, because their doctrine is "the truth," that the knowledge or the belief of it is held to be so indispensable. There can be no fair discussion of the question of usefulness, when an argument so vital may be employed on one side, but not on the other. And in point of fact, when law or public feeling do not permit the truth of an opinion to be disputed, they are just as little tolerant of a denial of its usefulness. The utmost they allow is an extenuation of its absolute necessity, or of the positive guilt of rejecting it.

In order more fully to illustrate the mischief of denying a hearing to opinions because we, in our own judgment, have condemned them, it will be desirable to fix down the discussion to a concrete case; and I choose, by preference, the cases which are least favourable to me--in which the argument against freedom of opinion, both on the score of truth and on that of utility, is considered the strongest. Let the opinions impugned be the belief in a God and in a future state, or any of the commonly received doctrines of morality. To fight the battle on such ground, gives a great advantage to an unfair antagonist; since he will be sure to say (and many who have no desire to be unfair will say it internally), Are these the doctrines which you do not deem sufficiently certain to be taken under the protection of law? Is the belief in a God one of the opinions, to feel sure of which, you hold to be assuming infallibility? But I must be permitted to observe, that it is not the feeling sure of a doctrine (be it what it may) which I call an assumption of infallibility. It is the undertaking to decide that question _for others_, without allowing them to hear what can be said on the contrary side. And I denounce and reprobate this pretension not the less, if put forth on the side of my most solemn convictions. However positive any one's persuasion may be, not only of the falsity, but of the pernicious consequences--not only of the pernicious consequences, but (to adopt expressions which I altogether condemn) the immorality and impiety of an opinion; yet if, in pursuance of that private judgment, though backed by the public judgment of his country or his contemporaries, he prevents the opinion from being heard in its defence, he assumes infallibility. And so far from the assumption being less objectionable or less dangerous because the opinion is called immoral or impious, this is the case of all others in which it is most fatal. These are exactly the occasions on which the men of one generation commit those dreadful mistakes, which excite the astonishment and horror of posterity. It is among such that we find the instances memorable in history, when the arm of the law has been employed to root out the best men and the noblest doctrines; with deplorable success as to the men, though some of the doctrines have survived to be (as if in mockery) invoked, in defence of similar conduct towards those who dissent from _them_, or from their received interpretation.

Mankind can hardly be too often reminded that there was once a man named Socrates, between whom and the legal authorities and public opinion of his time, there took place a memorable collision. Born in an age and country abounding in individual greatness, this man has been handed down to us by those who best knew both him and the age, as the most virtuous man in it; while _we_ know him as the head and prototype of all subsequent teachers of virtue, the source equally of the lofty inspiration of Plato and the judicious utilitarianism of Aristotle, "_i maestri di color che sanno_," the two headsprings of ethical as of all other philosophy. This acknowledged master of all the eminent thinkers who have since lived--whose fame, still growing after more than two thousand years, all but outweighs the whole remainder of the names which make his native city illustrious--was put to death by his countrymen, after a judicial conviction, for impiety and immorality. Impiety, in denying the gods recognised by the State; indeed his accuser asserted (see the "Apologia") that he believed in no gods at all. Immorality, in being, by his doctrines and instructions, a "corruptor of youth." Of these charges the tribunal, there is every ground for believing, honestly found him guilty, and condemned the man who probably of all then born had deserved best of mankind, to be put to death as a criminal.

To pass from this to the only other instance of judicial iniquity, the mention of which, after the condemnation of Socrates, would not be an anticlimax: the event which took place on Calvary rather more than eighteen hundred years ago. The man who left on the memory of those who witnessed his life and conversation, such an impression of his moral grandeur, that eighteen subsequent centuries have done homage to him as the Almighty in person, was ignominiously put to death, as what? As a blasphemer. Men did not merely mistake their benefactor; they mistook him for the exact contrary of what he was, and treated him as that prodigy of impiety, which they themselves are now held to be, for their treatment of him. The feelings with which mankind now regard these lamentable transactions, especially the later of the two, render them extremely unjust in their judgment of the unhappy actors. These were, to all appearance, not bad men--not worse than men commonly are, but rather the contrary; men who possessed in a full, or somewhat more than a full measure, the religious, moral, and patriotic feelings of their time and people: the very kind of men

who, in all times, our own included, have every chance of passing through life blameless and respected. The high-priest who rent his garments when the words were pronounced, which, according to all the ideas of his country, constituted the blackest guilt, was in all probability quite as sincere in his horror and indignation, as the generality of respectable and pious men now are in the religious and moral sentiments they profess; and most of those who now shudder at his conduct, if they had lived in his time, and been born Jews, would have acted precisely as he did. Orthodox Christians who are tempted to think that those who stoned to death the first martyrs must have been worse men than they themselves are, ought to remember that one of those persecutors was Saint Paul.

Let us add one more example, the most striking of all, if the impressiveness of an error is measured by the wisdom and virtue of him who falls into it. If ever any one, possessed of power, had grounds for thinking himself the best and most enlightened among his cotemporaries, it was the Emperor Marcus Aurelius. Absolute monarch of the whole civilised world, he preserved through life not only the most unblemished justice, but what was less to be expected from his Stoical breeding, the tenderest heart. The few failings which are attributed to him, were all on the side of indulgence: while his writings, the highest ethical product of the ancient mind, differ scarcely perceptibly, if they differ at all, from the most characteristic teachings of Christ. This man, a better Christian in all but the dogmatic sense of the word, than almost any of the ostensibly Christian sovereigns who have since reigned, persecuted Christianity. Placed at the summit of all the previous attainments of humanity, with an open, unfettered intellect, and a character which led him of himself to embody in his moral writings the Christian ideal, he yet failed to see that Christianity was to be a good and not an evil to the world, with his duties to which he was so deeply penetrated. Existing society he knew to be in a deplorable state. But such as it was, he saw, or thought he saw, that it was held together, and prevented from being worse, by belief and reverence of the received divinities. As a ruler of mankind, he deemed it his duty not to suffer society to fall in pieces; and saw not how, if its existing ties were removed, any others could be formed which could again knit it together. The new religion openly aimed at dissolving these ties: unless, therefore, it was his duty to adopt that religion, it seemed to be his duty to put it down. Inasmuch then as the theology of Christianity did not appear to him true or of divine origin; inasmuch as this strange history of a crucified God was not credible to him, and a system which purported to rest entirely upon a foundation to him so wholly unbelievable, could not be foreseen by him to be that renovating agency which, after all abatements, it has in fact proved to be; the gentlest and most amiable of philosophers and rulers, under a solemn sense of duty, authorised the persecution of Christianity. To my mind this is one of the most tragical facts in all history. It is a bitter thought, how different a thing the Christianity of the world might have been, if the Christian faith had been adopted as the religion of the empire under the auspices of Marcus Aurelius instead of those of Constantine. But it would be equally unjust to him and false to truth, to deny, that no one plea which can be urged for punishing anti-Christian teaching, was wanting to Marcus Aurelius for punishing, as he did, the propagation of Christianity. No Christian more firmly believes that Atheism is false, and tends to the dissolution of society, than Marcus Aurelius believed the same things of Christianity; he who, of all men then living, might have been thought the most capable of appreciating it. Unless any one who approves of punishment for the promulgation of opinions, flatters himself that he is a wiser and better man than Marcus Aurelius--more deeply versed in the wisdom of his time, more elevated in his intellect above it--more earnest in his search for truth, or more single-minded in his devotion to it when found;--let him abstain from that assumption of the joint infallibility of himself and the multitude, which the great Antoninus made with so unfortunate a result.

Aware of the impossibility of defending the use of punishment for restraining irreligious opinions, by any argument which will not justify Marcus Antoninus, the enemies of religious freedom, when hard pressed, occasionally accept this consequence, and say, with Dr. Johnson, that the persecutors of Christianity were in the right; that persecution is an ordeal through which truth ought to pass, and always passes successfully, legal penalties being, in the end, powerless against truth, though sometimes beneficially effective against mischievous errors. This is a form of the argument for religious intolerance, sufficiently remarkable not to be passed without notice.

A theory which maintains that truth may justifiably be persecuted because persecution cannot possibly do it any harm, cannot be charged with being intentionally hostile to the reception of new truths; but we cannot commend the generosity of its dealing with the persons to whom mankind are indebted for them. To discover to the world something which deeply concerns it, and of which it was previously ignorant; to prove to it that it had been mistaken on some vital point of temporal or spiritual interest, is as important a service as a human being can render to his fellow-creatures, and in certain cases, as in those of the early Christians and of the Reformers, those who think with Dr. Johnson believe it to have been the most precious gift which could be bestowed on mankind. That the authors of such splendid benefits should be requited by martyrdom; that their reward should be to be dealt with as the vilest of criminals, is not, upon this theory, a deplorable error and misfortune, for which humanity should mourn in sackcloth and ashes, but the normal and justifiable state of things. The propounder of a new truth, according to this doctrine, should stand, as

stood, in the legislation of the Locrians, the proposer of a new law, with a halter round his neck, to be instantly tightened if the public assembly did not, on hearing his reasons, then and there adopt his proposition. People who defend this mode of treating benefactors, cannot be supposed to set much value on the benefit; and I believe this view of the subject is mostly confined to the sort of persons who think that new truths may have been desirable once, but that we have had enough of them now.

But, indeed, the dictum that truth always triumphs over persecution, is one of those pleasant falsehoods which men repeat after one another till they pass into commonplaces, but which all experience refutes. History teems with instances of truth put down by persecution. If not suppressed for ever, it may be thrown back for centuries. To speak only of religious opinions: the Reformation broke out at least twenty times before Luther, and was put down. Arnold of Brescia was put down. Fra Dolcino was put down. Savonarola was put down. The Albigeois were put down. The Vaudois were put down. The Lollards were put down. The Hussites were put down. Even after the era of Luther, wherever persecution was persisted in, it was successful. In Spain, Italy, Flanders, the Austrian empire, Protestantism was rooted out; and, most likely, would have been so in England, had Queen Mary lived, or Queen Elizabeth died. Persecution has always succeeded, save where the heretics were too strong a party to be effectually persecuted. No reasonable person can doubt that Christianity might have been extirpated in the Roman Empire. It spread, and became predominant, because the persecutions were only occasional, lasting but a short time, and separated by long intervals of almost undisturbed propagandism. It is a piece of idle sentimentality that truth, merely as truth, has any inherent power denied to error, of prevailing against the dungeon and the stake. Men are not more zealous for truth than they often are for error, and a sufficient application of legal or even of social penalties will generally succeed in stopping the propagation of either. The real advantage which truth has, consists in this, that when an opinion is true, it may be extinguished once, twice, or many times, but in the course of ages there will generally be found persons to rediscover it, until some one of its reappearances falls on a time when from favourable circumstances it escapes persecution until it has made such head as to withstand all subsequent attempts to suppress it.

It will be said, that we do not now put to death the introducers of new opinions: we are not like our fathers who slew the prophets, we even build sepulchres to them. It is true we no longer put heretics to death; and the amount of penal infliction which modern feeling would probably tolerate, even against the most obnoxious opinions, is not sufficient to extirpate them. But let us not flatter ourselves that we are yet free from the stain even of legal persecution. Penalties for opinion, or at least for its expression, still exist by law; and their enforcement is not, even in these times, so unexampled as to make it at all incredible that they may some day be revived in full force. In the year 1857, at the summer assizes of the county of Cornwall, an unfortunate man,[7] said to be of unexceptionable conduct in all relations of life, was sentenced to twenty-one months' imprisonment, for uttering, and writing on a gate, some offensive words concerning Christianity. Within a month of the same time, at the Old Bailey, two persons, on two separate occasions,[8] were rejected as jurymen, and one of them grossly insulted by the judge and by one of the counsel, because they honestly declared that they had no theological belief; and a third, a foreigner,[9] for the same reason, was denied justice against a thief. This refusal of redress took place in virtue of the legal doctrine, that no person can be allowed to give evidence in a court of justice, who does not profess belief in a God (any god is sufficient) and in a future state; which is equivalent to declaring such persons to be outlaws, excluded from the protection of the tribunals; who may not only be robbed or assaulted with impunity, if no one but themselves, or persons of similar opinions, be present, but any one else may be robbed or assaulted with impunity, if the proof of the fact depends on their evidence. The assumption on which this is grounded, is that the oath is worthless, of a person who does not believe in a future state; a proposition which betokens much ignorance of history in those who assent to it (since it is historically true that a large proportion of infidels in all ages have been persons of distinguished integrity and honour); and would be maintained by no one who had the smallest conception how many of the persons in greatest repute with the world, both for virtues and for attainments, are well known, at least to their intimates, to be unbelievers. The rule, besides, is suicidal, and cuts away its own foundation. Under pretence that atheists must be liars, it admits the testimony of all atheists who are willing to lie, and rejects only those who brave the obloquy of publicly confessing a detested creed rather than affirm a falsehood. A rule thus self-convicted of absurdity so far as regards its professed purpose, can be kept in force only as a badge of hatred, a relic of persecution; a persecution, too, having the peculiarity, that the qualification for undergoing it, is the being clearly proved not to deserve it. The rule, and the theory it implies, are hardly less insulting to believers than to infidels. For if he who does not believe in a future state, necessarily lies, it follows that they who do believe are only prevented from lying, if prevented they are, by the fear of hell. We will not do the authors and abettors of the rule the injury of supposing, that the conception which they have formed of Christian virtue is drawn from their own consciousness.

These, indeed, are but rags and remnants of persecution, and may be thought to be not so much an indication of the wish to persecute, as an example of that very frequent infirmity of English minds, which makes them take a preposterous pleasure in the

assertion of a bad principle, when they are no longer bad enough to desire to carry it really into practice. But unhappily there is no security in the state of the public mind, that the suspension of worse forms of legal persecution, which has lasted for about the space of a generation, will continue. In this age the quiet surface of routine is as often ruffled by attempts to resuscitate past evils, as to introduce new benefits. What is boasted of at the present time as the revival of religion, is always, in narrow and uncultivated minds, at least as much the revival of bigotry; and where there is the strong permanent leaven of intolerance in the feelings of a people, which at all times abides in the middle classes of this country, it needs but little to provoke them into actively persecuting those whom they have never ceased to think proper objects of persecution.[10] For it is this--it is the opinions men entertain, and the feelings they cherish, respecting those who disown the beliefs they deem important, which makes this country not a place of mental freedom. For a long time past, the chief mischief of the legal penalties is that they strengthen the social stigma. It is that stigma which is really effective, and so effective is it that the profession of opinions which are under the ban of society is much less common in England, than is, in many other countries, the avowal of those which incur risk of judicial punishment. In respect to all persons but those whose pecuniary circumstances make them independent of the good will of other people, opinion, on this subject, is as efficacious as law; men might as well be imprisoned, as excluded from the means of earning their bread. Those whose bread is already secured, and who desire no favours from men in power, or from bodies of men, or from the public, have nothing to fear from the open avowal of any opinions, but to be ill-thought of and ill-spoken of, and this it ought not to require a very heroic mould to enable them to bear. There is no room for any appeal _ad misericordiam_ in behalf of such persons. But though we do not now inflict so much evil on those who think differently from us, as it was formerly our custom to do, it may be that we do ourselves as much evil as ever by our treatment of them. Socrates was put to death, but the Socratic philosophy rose like the sun in heaven, and spread its illumination over the whole intellectual firmament. Christians were cast to the lions, but the Christian church grew up a stately and spreading tree, overtopping the older and less vigorous growths, and stifling them by its shade. Our merely social intolerance kills no one, roots out no opinions, but induces men to disguise them, or to abstain from any active effort for their diffusion. With us, heretical opinions do not perceptibly gain, or even lose, ground in each decade or generation; they never blaze out far and wide, but continue to smoulder in the narrow circles of thinking and studious persons among whom they originate, without ever lighting up the general affairs of mankind with either a true or a deceptive light. And thus is kept up a state of things very satisfactory to some minds, because, without the unpleasant process of fining or imprisoning anybody, it maintains all prevailing opinions outwardly undisturbed, while it does not absolutely interdict the exercise of reason by dissentients afflicted with the malady of thought. A convenient plan for having peace in the intellectual world, and keeping all things going on therein very much as they do already. But the price paid for this sort of intellectual pacification, is the sacrifice of the entire moral courage of the human mind. A state of things in which a large portion of the most active and inquiring intellects find it advisable to keep the genuine principles and grounds of their convictions within their own breasts, and attempt, in what they address to the public, to fit as much as they can of their own conclusions to premises which they have internally renounced, cannot send forth the open, fearless characters, and logical, consistent intellects who once adorned the thinking world. The sort of men who can be looked for under it, are either mere conformers to commonplace, or time-servers for truth, whose arguments on all great subjects are meant for their hearers, and are not those which have convinced themselves. Those who avoid this alternative, do so by narrowing their thoughts and interest to things which can be spoken of without venturing within the region of principles, that is, to small practical matters, which would come right of themselves, if but the minds of mankind were strengthened and enlarged, and which will never be made effectually right until then: while that which would strengthen and enlarge men's minds, free and daring speculation on the highest subjects, is abandoned.

Those in whose eyes this reticence on the part of heretics is no evil, should consider in the first place, that in consequence of it there is never any fair and thorough discussion of heretical opinions; and that such of them as could not stand such a discussion, though they may be prevented from spreading, do not disappear. But it is not the minds of heretics that are deteriorated most, by the ban placed on all inquiry which does not end in the orthodox conclusions. The greatest harm done is to those who are not heretics, and whose whole mental development is cramped, and their reason cowed, by the fear of heresy. Who can compute what the world loses in the multitude of promising intellects combined with timid characters, who dare not follow out any bold, vigorous, independent train of thought, lest it should land them in something which would admit of being considered irreligious or immoral? Among them we may occasionally see some man of deep conscientiousness, and subtle and refined understanding, who spends a life in sophisticating with an intellect which he cannot silence, and exhausts the resources of ingenuity in attempting to reconcile the promptings of his conscience and reason with orthodoxy, which yet he does not, perhaps, to the end succeed in doing. No one can be a great thinker who does not recognise, that as a thinker it is his first duty to follow his intellect to whatever conclusions it may lead. Truth gains more even by the errors of one who, with due study and preparation, thinks for himself, than by the true opinions of those who only hold them because they do not suffer themselves to think. Not that it is solely, or chiefly, to form great thinkers,

that freedom of thinking is required. On the contrary, it is as much, and even more indispensable, to enable average human beings to attain the mental stature which they are capable of. There have been, and may again be, great individual thinkers, in a general atmosphere of mental slavery. But there never has been, nor ever will be, in that atmosphere, an intellectually active people. Where any people has made a temporary approach to such a character, it has been because the dread of heterodox speculation was for a time suspended. Where there is a tacit convention that principles are not to be disputed; where the discussion of the greatest questions which can occupy humanity is considered to be closed, we cannot hope to find that generally high scale of mental activity which has made some periods of history so remarkable. Never when controversy avoided the subjects which are large and important enough to kindle enthusiasm, was the mind of a people stirred up from its foundations, and the impulse given which raised even persons of the most ordinary intellect to something of the dignity of thinking beings. Of such we have had an example in the condition of Europe during the times immediately following the Reformation; another, though limited to the Continent and to a more cultivated class, in the speculative movement of the latter half of the eighteenth century; and a third, of still briefer duration, in the intellectual fermentation of Germany during the Goethian and Fichtean period. These periods differed widely in the particular opinions which they developed; but were alike in this, that during all three the yoke of authority was broken. In each, an old mental despotism had been thrown off, and no new one had yet taken its place. The impulse given at these three periods has made Europe what it now is. Every single improvement which has taken place either in the human mind or in institutions, may be traced distinctly to one or other of them. Appearances have for some time indicated that all three impulses are well-nigh spent; and we can expect no fresh start, until we again assert our mental freedom.

Let us now pass to the second division of the argument, and dismissing the supposition that any of the received opinions may be false, let us assume them to be true, and examine into the worth of the manner in which they are likely to be held, when their truth is not freely and openly canvassed. However unwillingly a person who has a strong opinion may admit the possibility that his opinion may be false, he ought to be moved by the consideration that however true it may be, if it is not fully, frequently, and fearlessly discussed, it will be held as a dead dogma, not a living truth.

There is a class of persons (happily not quite so numerous as formerly) who think it enough if a person assents undoubtingly to what they think true, though he has no knowledge whatever of the grounds of the opinion, and could not make a tenable defence of it against the most superficial objections. Such persons, if they can once get their creed taught from authority, naturally think that no good, and some harm, comes of its being allowed to be questioned. Where their influence prevails, they make it nearly impossible for the received opinion to be rejected wisely and considerately, though it may still be rejected rashly and ignorantly; for to shut out discussion entirely is seldom possible, and when it once gets in, beliefs not grounded on conviction are apt to give way before the slightest semblance of an argument. Waiving, however, this possibility--assuming that the true opinion abides in the mind, but abides as a prejudice, a belief independent of, and proof against, argument--this is not the way in which truth ought to be held by a rational being. This is not knowing the truth. Truth, thus held, is but one superstition the more, accidentally clinging to the words which enunciate a truth.

If the intellect and judgment of mankind ought to be cultivated, a thing which Protestants at least do not deny, on what can these faculties be more appropriately exercised by any one, than on the things which concern him so much that it is considered necessary for him to hold opinions on them? If the cultivation of the understanding consists in one thing more than in another, it is surely in learning the grounds of one's own opinions. Whatever people believe, on subjects on which it is of the first importance to believe rightly, they ought to be able to defend against at least the common objections. But, some one may say, "Let them be _taught_ the grounds of their opinions. It does not follow that opinions must be merely parroted because they are never heard controverted. Persons who learn geometry do not simply commit the theorems to memory, but understand and learn likewise the demonstrations; and it would be absurd to say that they remain ignorant of the grounds of geometrical truths, because they never hear any one deny, and attempt to disprove them." Undoubtedly: and such teaching suffices on a subject like mathematics, where there is nothing at all to be said on the wrong side of the question. The peculiarity of the evidence of mathematical truths is, that all the argument is on one side. There are no objections, and no answers to objections. But on every subject on which difference of opinion is possible, the truth depends on a balance to be struck between two sets of conflicting reasons. Even in natural philosophy, there is always some other explanation possible of the same facts; some geocentric theory instead of heliocentric, some phlogiston instead of oxygen; and it has to be shown why that other theory cannot be the true one: and until this is shown, and until we know how it is shown, we do not understand the grounds of our opinion. But when we turn to subjects infinitely more complicated, to morals, religion, politics, social relations, and the business of life, three-fourths of the arguments for every disputed opinion consist in dispelling the appearances which favour some opinion different from it. The greatest orator, save one, of antiquity, has left it on record that he always studied his adversary's case with as great, if not with still greater, intensity than even

his own. What Cicero practised as the means of forensic success, requires to be imitated by all who study any subject in order to arrive at the truth. He who knows only his own side of the case, knows little of that. His reasons may be good, and no one may have been able to refute them. But if he is equally unable to refute the reasons on the opposite side; if he does not so much as know what they are, he has no ground for preferring either opinion. The rational position for him would be suspension of judgment, and unless he contents himself with that, he is either led by authority, or adopts, like the generality of the world, the side to which he feels most inclination. Nor is it enough that he should hear the arguments of adversaries from his own teachers, presented as they state them, and accompanied by what they offer as refutations. That is not the way to do justice to the arguments, or bring them into real contact with his own mind. He must be able to hear them from persons who actually believe them; who defend them in earnest, and do their very utmost for them. He must know them in their most plausible and persuasive form; he must feel the whole force of the difficulty which the true view of the subject has to encounter and dispose of; else he will never really possess himself of the portion of truth which meets and removes that difficulty. Ninety-nine in a hundred of what are called educated men are in this condition; even of those who can argue fluently for their opinions. Their conclusion may be true, but it might be false for anything they know: they have never thrown themselves into the mental position of those who think differently from them, and considered what such persons may have to say; and consequently they do not, in any proper sense of the word, know the doctrine which they themselves profess. They do not know those parts of it which explain and justify the remainder; the considerations which show that a fact which seemingly conflicts with another is reconcilable with it, or that, of two apparently strong reasons, one and not the other ought to be preferred. All that part of the truth which turns the scale, and decides the judgment of a completely informed mind, they are strangers to; nor is it ever really known, but to those who have attended equally and impartially to both sides, and endeavoured to see the reasons of both in the strongest light. So essential is this discipline to a real understanding of moral and human subjects, that if opponents of all important truths do not exist, it is indispensable to imagine them, and supply them with the strongest arguments which the most skilful devil's advocate can conjure up.

To abate the force of these considerations, an enemy of free discussion may be supposed to say, that there is no necessity for mankind in general to know and understand all that can be said against or for their opinions by philosophers and theologians. That it is not needful for common men to be able to expose all the misstatements or fallacies of an ingenious opponent. That it is enough if there is always somebody capable of answering them, so that nothing likely to mislead uninstructed persons remains unrefuted. That simple minds, having been taught the obvious grounds of the truths inculcated on them, may trust to authority for the rest, and being aware that they have neither knowledge nor talent to resolve every difficulty which can be raised, may repose in the assurance that all those which have been raised have been or can be answered, by those who are specially trained to the task.

Conceding to this view of the subject the utmost that can be claimed for it by those most easily satisfied with the amount of understanding of truth which ought to accompany the belief of it; even so, the argument for free discussion is no way weakened. For even this doctrine acknowledges that mankind ought to have a rational assurance that all objections have been satisfactorily answered; and how are they to be answered if that which requires to be answered is not spoken? or how can the answer be known to be satisfactory, if the objectors have no opportunity of showing that it is unsatisfactory? If not the public, at least the philosophers and theologians who are to resolve the difficulties, must make themselves familiar with those difficulties in their most puzzling form; and this cannot be accomplished unless they are freely stated, and placed in the most advantageous light which they admit of. The Catholic Church has its own way of dealing with this embarrassing problem. It makes a broad separation between those who can be permitted to receive its doctrines on conviction, and those who must accept them on trust. Neither, indeed, are allowed any choice as to what they will accept; but the clergy, such at least as can be fully confided in, may admissibly and meritoriously make themselves acquainted with the arguments of opponents, in order to answer them, and may, therefore, read heretical books; the laity, not unless by special permission, hard to be obtained. This discipline recognises a knowledge of the enemy's case as beneficial to the teachers, but finds means, consistent with this, of denying it to the rest of the world: thus giving to the _elite_ more mental culture, though not more mental freedom, than it allows to the mass. By this device it succeeds in obtaining the kind of mental superiority which its purposes require; for though culture without freedom never made a large and liberal mind, it can make a clever _nisi prius_ advocate of a cause. But in countries professing Protestantism, this resource is denied; since Protestants hold, at least in theory, that the responsibility for the choice of a religion must be borne by each for himself, and cannot be thrown off upon teachers. Besides, in the present state of the world, it is practically impossible that writings which are read by the instructed can be kept from the uninstructed. If the teachers of mankind are to be cognisant of all that they ought to know, everything must be free to be written and published without restraint.

If, however, the mischievous operation of the absence of free discussion, when the received opinions are true, were confined to leaving men ignorant of the grounds of those opinions, it might be thought that this, if an intellectual, is no moral evil, and does not

affect the worth of the opinions, regarded in their influence on the character. The fact, however, is, that not only the grounds of the opinion are forgotten in the absence of discussion, but too often the meaning of the opinion itself. The words which convey it, cease to suggest ideas, or suggest only a small portion of those they were originally employed to communicate. Instead of a vivid conception and a living belief, there remain only a few phrases retained by rote; or, if any part, the shell and husk only of the meaning is retained, the finer essence being lost. The great chapter in human history which this fact occupies and fills, cannot be too earnestly studied and meditated on.

It is illustrated in the experience of almost all ethical doctrines and religious creeds. They are all full of meaning and vitality to those who originate them, and to the direct disciples of the originators. Their meaning continues to be felt in undiminished strength, and is perhaps brought out into even fuller consciousness, so long as the struggle lasts to give the doctrine or creed an ascendency over other creeds. At last it either prevails, and becomes the general opinion, or its progress stops; it keeps possession of the ground it has gained, but ceases to spread further. When either of these results has become apparent, controversy on the subject flags, and gradually dies away. The doctrine has taken its place, if not as a received opinion, as one of the admitted sects or divisions of opinion: those who hold it have generally inherited, not adopted it; and conversion from one of these doctrines to another, being now an exceptional fact, occupies little place in the thoughts of their professors. Instead of being, as at first, constantly on the alert either to defend themselves against the world, or to bring the world over to them, they have subsided into acquiescence, and neither listen, when they can help it, to arguments against their creed, nor trouble dissentients (if there be such) with arguments in its favour. From this time may usually be dated the decline in the living power of the doctrine. We often hear the teachers of all creeds lamenting the difficulty of keeping up in the minds of believers a lively apprehension of the truth which they nominally recognise, so that it may penetrate the feelings, and acquire a real mastery over the conduct. No such difficulty is complained of while the creed is still fighting for its existence: even the weaker combatants then know and feel what they are fighting for, and the difference between it and other doctrines; and in that period of every creed's existence, not a few persons may be found, who have realised its fundamental principles in all the forms of thought, have weighed and considered them in all their important bearings, and have experienced the full effect on the character, which belief in that creed ought to produce in a mind thoroughly imbued with it. But when it has come to be a hereditary creed, and to be received passively, not actively--when the mind is no longer compelled, in the same degree as at first, to exercise its vital powers on the questions which its belief presents to it, there is a progressive tendency to forget all of the belief except the formularies, or to give it a dull and torpid assent, as if accepting it on trust dispensed with the necessity of realising it in consciousness, or testing it by personal experience; until it almost ceases to connect itself at all with the inner life of the human being. Then are seen the cases, so frequent in this age of the world as almost to form the majority, in which the creed remains as it were outside the mind, encrusting and petrifying it against all other influences addressed to the higher parts of our nature; manifesting its power by not suffering any fresh and living conviction to get in, but itself doing nothing for the mind or heart, except standing sentinel over them to keep them vacant.

To what an extent doctrines intrinsically fitted to make the deepest impression upon the mind may remain in it as dead beliefs, without being ever realised in the imagination, the feelings, or the understanding, is exemplified by the manner in which the majority of believers hold the doctrines of Christianity. By Christianity I here mean what is accounted such by all churches and sects--the maxims and precepts contained in the New Testament. These are considered sacred, and accepted as laws, by all professing Christians. Yet it is scarcely too much to say that not one Christian in a thousand guides or tests his individual conduct by reference to those laws. The standard to which he does refer it, is the custom of his nation, his class, or his religious profession. He has thus, on the one hand, a collection of ethical maxims, which he believes to have been vouchsafed to him by infallible wisdom as rules for his government; and on the other, a set of every-day judgments and practices, which go a certain length with some of those maxims, not so great a length with others, stand in direct opposition to some, and are, on the whole, a compromise between the Christian creed and the interests and suggestions of worldly life. To the first of these standards he gives his homage; to the other his real allegiance. All Christians believe that the blessed are the poor and humble, and those who are ill-used by the world; that it is easier for a camel to pass through the eye of a needle than for a rich man to enter the kingdom of heaven; that they should judge not, lest they be judged; that they should swear not at all; that they should love their neighbour as themselves; that if one take their cloak, they should give him their coat also; that they should take no thought for the morrow; that if they would be perfect, they should sell all that they have and give it to the poor. They are not insincere when they say that they believe these things. They do believe them, as people believe what they have always heard lauded and never discussed. But in the sense of that living belief which regulates conduct, they believe these doctrines just up to the point to which it is usual to act upon them. The doctrines in their integrity are serviceable to pelt adversaries with; and it is understood that they are to be put forward (when possible) as the reasons for whatever people do that they think laudable. But any one who reminded them that the maxims require an infinity of things which

they never even think of doing, would gain nothing but to be classed among those very unpopular characters who affect to be better than other people. The doctrines have no hold on ordinary believers--are not a power in their minds. They have a habitual respect for the sound of them, but no feeling which spreads from the words to the things signified, and forces the mind to take _them_ in, and make them conform to the formula. Whenever conduct is concerned, they look round for Mr. A and B to direct them how far to go in obeying Christ.

Now we may be well assured that the case was not thus, but far otherwise, with the early Christians. Had it been thus, Christianity never would have expanded from an obscure sect of the despised Hebrews into the religion of the Roman empire. When their enemies said, "See how these Christians love one another" (a remark not likely to be made by anybody now), they assuredly had a much livelier feeling of the meaning of their creed than they have ever had since. And to this cause, probably, it is chiefly owing that Christianity now makes so little progress in extending its domain, and after eighteen centuries, is still nearly confined to Europeans and the descendants of Europeans. Even with the strictly religious, who are much in earnest about their doctrines, and attach a greater amount of meaning to many of them than people in general, it commonly happens that the part which is thus comparatively active in their minds is that which was made by Calvin, or Knox, or some such person much nearer in character to themselves. The sayings of Christ coexist passively in their minds, producing hardly any effect beyond what is caused by mere listening to words so amiable and bland. There are many reasons, doubtless, why doctrines which are the badge of a sect retain more of their vitality than those common to all recognised sects, and why more pains are taken by teachers to keep their meaning alive; but one reason certainly is, that the peculiar doctrines are more questioned, and have to be oftener defended against open gainsayers. Both teachers and learners go to sleep at their post, as soon as there is no enemy in the field.

The same thing holds true, generally speaking, of all traditional doctrines--those of prudence and knowledge of life, as well as of morals or religion. All languages and literatures are full of general observations on life, both as to what it is, and how to conduct oneself in it; observations which everybody knows, which everybody repeats, or hears with acquiescence, which are received as truisms, yet of which most people first truly learn the meaning, when experience, generally of a painful kind, has made it a reality to them. How often, when smarting under some unforeseen misfortune or disappointment, does a person call to mind some proverb or common saying, familiar to him all his life, the meaning of which, if he had ever before felt it as he does now, would have saved him from the calamity. There are indeed reasons for this, other than the absence of discussion: there are many truths of which the full meaning _cannot_ be realised, until personal experience has brought it home. But much more of the meaning even of these would have been understood, and what was understood would have been far more deeply impressed on the mind, if the man had been accustomed to hear it argued _pro_ and _con_ by people who did understand it. The fatal tendency of mankind to leave off thinking about a thing when it is no longer doubtful, is the cause of half their errors. A contemporary author has well spoken of "the deep slumber of a decided opinion."

But what! (it may be asked) Is the absence of unanimity an indispensable condition of true knowledge? Is it necessary that some part of mankind should persist in error, to enable any to realise the truth? Does a belief cease to be real and vital as soon as it is generally received--and is a proposition never thoroughly understood and felt unless some doubt of it remains? As soon as mankind have unanimously accepted a truth, does the truth perish within them? The highest aim and best result of improved intelligence, it has hitherto been thought, is to unite mankind more and more in the acknowledgment of all important truths: and does the intelligence only last as long as it has not achieved its object? Do the fruits of conquest perish by the very completeness of the victory?

I affirm no such thing. As mankind improve, the number of doctrines which are no longer disputed or doubted will be constantly on the increase: and the well-being of mankind may almost be measured by the number and gravity of the truths which have reached the point of being uncontested. The cessation, on one question after another, of serious controversy, is one of the necessary incidents of the consolidation of opinion; a consolidation as salutary in the case of true opinions, as it is dangerous and noxious when the opinions are erroneous. But though this gradual narrowing of the bounds of diversity of opinion is necessary in both senses of the term, being at once inevitable and indispensable, we are not therefore obliged to conclude that all its consequences must be beneficial. The loss of so important an aid to the intelligent and living apprehension of a truth, as is afforded by the necessity of explaining it to, or defending it against, opponents, though not sufficient to outweigh, is no trifling drawback from, the benefit of its universal recognition. Where this advantage can no longer be had, I confess I should like to see the teachers of mankind endeavouring to provide a substitute for it; some contrivance for making the difficulties of the question as present to the learner's consciousness, as if they were pressed upon him by a dissentient champion, eager for his conversion.

But instead of seeking contrivances for this purpose, they have lost those they formerly had. The Socratic dialectics, so magnificently exemplified in the dialogues of Plato, were a contrivance of this description. They were essentially a negative discussion of the great questions of philosophy and life, directed with consummate skill to the purpose of convincing any one who had merely adopted the commonplaces of received opinion, that he did not understand the subject--that he as yet attached no definite meaning to the doctrines he professed; in order that, becoming aware of his ignorance, he might be put in the way to attain a stable belief, resting on a clear apprehension both of the meaning of doctrines and of their evidence. The school disputations of the middle ages had a somewhat similar object. They were intended to make sure that the pupil understood his own opinion, and (by necessary correlation) the opinion opposed to it, and could enforce the grounds of the one and confute those of the other. These last-mentioned contests had indeed the incurable defect, that the premises appealed to were taken from authority, not from reason; and, as a discipline to the mind, they were in every respect inferior to the powerful dialectics which formed the intellects of the "Socratici viri": but the modern mind owes far more to both than it is generally willing to admit, and the present modes of education contain nothing which in the smallest degree supplies the place either of the one or of the other. A person who derives all his instruction from teachers or books, even if he escape the besetting temptation of contenting himself with cram, is under no compulsion to hear both sides; accordingly it is far from a frequent accomplishment, even among thinkers, to know both sides; and the weakest part of what everybody says in defence of his opinion, is what he intends as a reply to antagonists. It is the fashion of the present time to disparage negative logic--that which points out weaknesses in theory or errors in practice, without establishing positive truths. Such negative criticism would indeed be poor enough as an ultimate result; but as a means to attaining any positive knowledge or conviction worthy the name, it cannot be valued too highly; and until people are again systematically trained to it, there will be few great thinkers, and a low general average of intellect, in any but the mathematical and physical departments of speculation. On any other subject no one's opinions deserve the name of knowledge, except so far as he has either had forced upon him by others, or gone through of himself, the same mental process which would have been required of him in carrying on an active controversy with opponents. That, therefore, which when absent, it is so indispensable, but so difficult, to create, how worse than absurd is it to forego, when spontaneously offering itself! If there are any persons who contest a received opinion, or who will do so if law or opinion will let them, let us thank them for it, open our minds to listen to them, and rejoice that there is some one to do for us what we otherwise ought, if we have any regard for either the certainty or the vitality of our convictions, to do with much greater labour for ourselves.

It still remains to speak of one of the principal causes which make diversity of opinion advantageous, and will continue to do so until mankind shall have entered a stage of intellectual advancement which at present seems at an incalculable distance. We have hitherto considered only two possibilities: that the received opinion may be false, and some other opinion, consequently, true; or that, the received opinion being true, a conflict with the opposite error is essential to a clear apprehension and deep feeling of its truth. But there is a commoner case than either of these; when the conflicting doctrines, instead of being one true and the other false, share the truth between them; and the nonconforming opinion is needed to supply the remainder of the truth, of which the received doctrine embodies only a part. Popular opinions, on subjects not palpable to sense, are often true, but seldom or never the whole truth. They are a part of the truth; sometimes a greater, sometimes a smaller part, but exaggerated, distorted, and disjoined from the truths by which they ought to be accompanied and limited. Heretical opinions, on the other hand, are generally some of these suppressed and neglected truths, bursting the bonds which kept them down, and either seeking reconciliation with the truth contained in the common opinion, or fronting it as enemies, and setting themselves up, with similar exclusiveness, as the whole truth. The latter case is hitherto the most frequent, as, in the human mind, one-sidedness has always been the rule, and many-sidedness the exception. Hence, even in revolutions of opinion, one part of the truth usually sets while another rises. Even progress, which ought to superadd, for the most part only substitutes one partial and incomplete truth for another; improvement consisting chiefly in this, that the new fragment of truth is more wanted, more adapted to the needs of the time, than that which it displaces. Such being the partial character of prevailing opinions, even when resting on a true foundation; every opinion which embodies somewhat of the portion of truth which the common opinion omits, ought to be considered precious, with whatever amount of error and confusion that truth may be blended. No sober judge of human affairs will feel bound to be indignant because those who force on our notice truths which we should otherwise have overlooked, overlook some of those which we see. Rather, he will think that so long as popular truth is one-sided, it is more desirable than otherwise that unpopular truth should have one-sided asserters too; such being usually the most energetic, and the most likely to compel reluctant attention to the fragment of wisdom which they proclaim as if it were the whole.

Thus, in the eighteenth century, when nearly all the instructed, and all those of the uninstructed who were led by them, were lost in admiration of what is called civilisation, and of the marvels of modern science, literature, and philosophy, and while greatly

overrating the amount of unlikeness between the men of modern and those of ancient times, indulged the belief that the whole of the difference was in their own favour; with what a salutary shock did the paradoxes of Rousseau explode like bombshells in the midst, dislocating the compact mass of one-sided opinion, and forcing its elements to recombine in a better form and with additional ingredients. Not that the current opinions were on the whole farther from the truth than Rousseau's were; on the contrary, they were nearer to it; they contained more of positive truth, and very much less of error. Nevertheless there lay in Rousseau's doctrine, and has floated down the stream of opinion along with it, a considerable amount of exactly those truths which the popular opinion wanted; and these are the deposit which was left behind when the flood subsided. The superior worth of simplicity of life, the enervating and demoralising effect of the trammels and hypocrisies of artificial society, are ideas which have never been entirely absent from cultivated minds since Rousseau wrote; and they will in time produce their due effect, though at present needing to be asserted as much as ever, and to be asserted by deeds, for words, on this subject, have nearly exhausted their power.

In politics, again, it is almost a commonplace, that a party of order or stability, and a party of progress or reform, are both necessary elements of a healthy state of political life; until the one or the other shall have so enlarged its mental grasp as to be a party equally of order and of progress, knowing and distinguishing what is fit to be preserved from what ought to be swept away. Each of these modes of thinking derives its utility from the deficiencies of the other; but it is in a great measure the opposition of the other that keeps each within the limits of reason and sanity. Unless opinions favourable to democracy and to aristocracy, to property and to equality, to co-operation and to competition, to luxury and to abstinence, to sociality and individuality, to liberty and discipline, and all the other standing antagonisms of practical life, are expressed with equal freedom, and enforced and defended with equal talent and energy, there is no chance of both elements obtaining their due; one scale is sure to go up and the other down. Truth, in the great practical concerns of life, is so much a question of the reconciling and combining of opposites, that very few have minds sufficiently capacious and impartial to make the adjustment with an approach to correctness, and it has to be made by the rough process of a struggle between combatants fighting under hostile banners. On any of the great open questions just enumerated, if either of the two opinions has a better claim than the other, not merely to be tolerated, but to be encouraged and countenanced, it is the one which happens at the particular time and place to be in a minority. That is the opinion which, for the time being, represents the neglected interests, the side of human well-being which is in danger of obtaining less than its share. I am aware that there is not, in this country, any intolerance of differences of opinion on most of these topics. They are adduced to show, by admitted and multiplied examples, the universality of the fact, that only through diversity of opinion is there, in the existing state of human intellect, a chance of fair-play to all sides of the truth. When there are persons to be found, who form an exception to the apparent unanimity of the world on any subject, even if the world is in the right, it is always probable that dissentients have something worth hearing to say for themselves, and that truth would lose something by their silence.

It may be objected, "But _some_ received principles, especially on the highest and most vital subjects, are more than half-truths. The Christian morality, for instance, is the whole truth on that subject, and if any one teaches a morality which varies from it, he is wholly in error." As this is of all cases the most important in practice, none can be fitter to test the general maxim. But before pronouncing what Christian morality is or is not, it would be desirable to decide what is meant by Christian morality. If it means the morality of the New Testament, I wonder that any one who derives his knowledge of this from the book itself, can suppose that it was announced, or intended, as a complete doctrine of morals. The Gospel always refers to a pre-existing morality, and confines its precepts to the particulars in which that morality was to be corrected, or superseded by a wider and higher; expressing itself, moreover, in terms most general, often impossible to be interpreted literally, and possessing rather the impressiveness of poetry or eloquence than the precision of legislation. To extract from it a body of ethical doctrine, has ever been possible without eking it out from the Old Testament, that is, from a system elaborate indeed, but in many respects barbarous, and intended only for a barbarous people. St. Paul, a declared enemy to this Judaical mode of interpreting the doctrine and filling up the scheme of his Master, equally assumes a pre-existing morality, namely, that of the Greeks and Romans; and his advice to Christians is in a great measure a system of accommodation to that; even to the extent of giving an apparent sanction to slavery. What is called Christian, but should rather be termed theological, morality, was not the work of Christ or the Apostles, but is of much later origin, having been gradually built up by the Catholic church of the first five centuries, and though not implicitly adopted by moderns and Protestants, has been much less modified by them than might have been expected. For the most part, indeed, they have contented themselves with cutting off the additions which had been made to it in the middle ages, each sect supplying the place by fresh additions, adapted to its own character and tendencies. That mankind owe a great debt to this morality, and to its early teachers, I should be the last person to deny; but I do not scruple to say of it, that it is, in many important points, incomplete and one-sided, and that unless ideas and feelings, not sanctioned by it, had contributed to the formation of European life and character, human affairs would have been in a worse condition than they now are. Christian morality (so called) has all the characters of a reaction; it is, in

great part, a protest against Paganism. Its ideal is negative rather than positive; passive rather than active; Innocence rather than Nobleness; Abstinence from Evil, rather than energetic Pursuit of Good: in its precepts (as has been well said) "thou shalt not" predominates unduly over "thou shalt." In its horror of sensuality, it made an idol of asceticism, which has been gradually compromised away into one of legality. It holds out the hope of heaven and the threat of hell, as the appointed and appropriate motives to a virtuous life: in this falling far below the best of the ancients, and doing what lies in it to give to human morality an essentially selfish character, by disconnecting each man's feelings of duty from the interests of his fellow-creatures, except so far as a self-interested inducement is offered to him for consulting them. It is essentially a doctrine of passive obedience; it inculcates submission to all authorities found established; who indeed are not to be actively obeyed when they command what religion forbids, but who are not to be resisted, far less rebelled against, for any amount of wrong to ourselves. And while, in the morality of the best Pagan nations, duty to the State holds even a disproportionate place, infringing on the just liberty of the individual; in purely Christian ethics, that grand department of duty is scarcely noticed or acknowledged. It is in the Koran, not the New Testament, that we read the maxim--"A ruler who appoints any man to an office, when there is in his dominions another man better qualified for it, sins against God and against the State." What little recognition the idea of obligation to the public obtains in modern morality, is derived from Greek and Roman sources, not from Christian; as, even in the morality of private life, whatever exists of magnanimity, high-mindedness, personal dignity, even the sense of honour, is derived from the purely human, not the religious part of our education, and never could have grown out of a standard of ethics in which the only worth, professedly recognised, is that of obedience.

I am as far as any one from pretending that these defects are necessarily inherent in the Christian ethics, in every manner in which it can be conceived, or that the many requisites of a complete moral doctrine which it does not contain, do not admit of being reconciled with it. Far less would I insinuate this of the doctrines and precepts of Christ himself. I believe that the sayings of Christ are all, that I can see any evidence of their having been intended to be; that they are irreconcilable with nothing which a comprehensive morality requires; that everything which is excellent in ethics may be brought within them, with no greater violence to their language than has been done to it by all who have attempted to deduce from them any practical system of conduct whatever. But it is quite consistent with this, to believe that they contain, and were meant to contain, only a part of the truth; that many essential elements of the highest morality are among the things which are not provided for, nor intended to be provided for, in the recorded deliverances of the Founder of Christianity, and which have been entirely thrown aside in the system of ethics erected on the basis of those deliverances by the Christian Church. And this being so, I think it a great error to persist in attempting to find in the Christian doctrine that complete rule for our guidance, which its author intended it to sanction and enforce, but only partially to provide. I believe, too, that this narrow theory is becoming a grave practical evil, detracting greatly from the value of the moral training and instruction, which so many well-meaning persons are now at length exerting themselves to promote. I much fear that by attempting to form the mind and feelings on an exclusively religious type, and discarding those secular standards (as for want of a better name they may be called) which heretofore co-existed with and supplemented the Christian ethics, receiving some of its spirit, and infusing into it some of theirs, there will result, and is even now resulting, a low, abject, servile type of character, which, submit itself as it may to what it deems the Supreme Will, is incapable of rising to or sympathising in the conception of Supreme Goodness. I believe that other ethics than any which can be evolved from exclusively Christian sources, must exist side by side with Christian ethics to produce the moral regeneration of mankind; and that the Christian system is no exception to the rule, that in an imperfect state of the human mind, the interests of truth require a diversity of opinions. It is not necessary that in ceasing to ignore the moral truths not contained in Christianity, men should ignore any of those which it does contain. Such prejudice, or oversight, when it occurs, is altogether an evil; but it is one from which we cannot hope to be always exempt, and must be regarded as the price paid for an inestimable good. The exclusive pretension made by a part of the truth to be the whole, must and ought to be protested against, and if a reactionary impulse should make the protestors unjust in their turn, this one-sidedness, like the other, may be lamented, but must be tolerated. If Christians would teach infidels to be just to Christianity, they should themselves be just to infidelity. It can do truth no service to blink the fact, known to all who have the most ordinary acquaintance with literary history, that a large portion of the noblest and most valuable moral teaching has been the work, not only of men who did not know, but of men who knew and rejected, the Christian faith.

I do not pretend that the most unlimited use of the freedom of enunciating all possible opinions would put an end to the evils of religious or philosophical sectarianism. Every truth which men of narrow capacity are in earnest about, is sure to be asserted, inculcated, and in many ways even acted on, as if no other truth existed in the world, or at all events none that could limit or qualify the first. I acknowledge that the tendency of all opinions to become sectarian is not cured by the freest discussion, but is often heightened and exacerbated thereby; the truth which ought to have been, but was not, seen, being rejected all the more violently

because proclaimed by persons regarded as opponents. But it is not on the impassioned partisan, it is on the calmer and more disinterested bystander, that this collision of opinions works its salutary effect. Not the violent conflict between parts of the truth, but the quiet suppression of half of it, is the formidable evil: there is always hope when people are forced to listen to both sides; it is when they attend only to one that errors harden into prejudices, and truth itself ceases to have the effect of truth, by being exaggerated into falsehood. And since there are few mental attributes more rare than that judicial faculty which can sit in intelligent judgment between two sides of a question, of which only one is represented by an advocate before it, truth has no chance but in proportion as every side of it, every opinion which embodies any fraction of the truth, not only finds advocates, but is so advocated as to be listened to.

We have now recognised the necessity to the mental well-being of mankind (on which all their other well-being depends) of freedom of opinion, and freedom of the expression of opinion, on four distinct grounds; which we will now briefly recapitulate.

First, if any opinion is compelled to silence, that opinion may, for aught we can certainly know, be true. To deny this is to assume our own infallibility.

Secondly, though the silenced opinion be an error, it may, and very commonly does, contain a portion of truth; and since the general or prevailing opinion on any subject is rarely or never the whole truth, it is only by the collision of adverse opinions, that the remainder of the truth has any chance of being supplied.

Thirdly, even if the received opinion be not only true, but the whole truth; unless it is suffered to be, and actually is, vigorously and earnestly contested, it will, by most of those who receive it, be held in the manner of a prejudice, with little comprehension or feeling of its rational grounds. And not only this, but, fourthly, the meaning of the doctrine itself will be in danger of being lost, or enfeebled, and deprived of its vital effect on the character and conduct: the dogma becoming a mere formal profession, inefficacious for good, but cumbering the ground, and preventing the growth of any real and heartfelt conviction, from reason or personal experience.

Before quitting the subject of freedom of opinion, it is fit to take some notice of those who say, that the free expression of all opinions should be permitted, on condition that the manner be temperate, and do not pass the bounds of fair discussion. Much might be said on the impossibility of fixing where these supposed bounds are to be placed; for if the test be offence to those whose opinion is attacked, I think experience testifies that this offence is given whenever the attack is telling and powerful, and that every opponent who pushes them hard, and whom they find it difficult to answer, appears to them, if he shows any strong feeling on the subject, an intemperate opponent. But this, though an important consideration in a practical point of view, merges in a more fundamental objection. Undoubtedly the manner of asserting an opinion, even though it be a true one, may be very objectionable, and may justly incur severe censure. But the principal offences of the kind are such as it is mostly impossible, unless by accidental self-betrayal, to bring home to conviction. The gravest of them is, to argue sophistically, to suppress facts or arguments, to misstate the elements of the case, or misrepresent the opposite opinion. But all this, even to the most aggravated degree, is so continually done in perfect good faith, by persons who are not considered, and in many other respects may not deserve to be considered, ignorant or incompetent, that it is rarely possible on adequate grounds conscientiously to stamp the misrepresentation as morally culpable; and still less could law presume to interfere with this kind of controversial misconduct. With regard to what is commonly meant by intemperate discussion, namely invective, sarcasm, personality, and the like, the denunciation of these weapons would deserve more sympathy if it were ever proposed to interdict them equally to both sides; but it is only desired to restrain the employment of them against the prevailing opinion: against the unprevailing they may not only be used without general disapproval, but will be likely to obtain for him who uses them the praise of honest zeal and righteous indignation. Yet whatever mischief arises from their use, is greatest when they are employed against the comparatively defenceless; and whatever unfair advantage can be derived by any opinion from this mode of asserting it, accrues almost exclusively to received opinions. The worst offence of this kind which can be committed by a polemic, is to stigmatise those who hold the contrary opinion as bad and immoral men. To calumny of this sort, those who hold any unpopular opinion are peculiarly exposed, because they are in general few and uninfluential, and nobody but themselves feel much interest in seeing justice done them; but this weapon is, from the nature of the case, denied to those who attack a prevailing opinion: they can neither use it with safety to themselves, nor, if they could, would it do anything but recoil on their own cause. In general, opinions contrary to those commonly received can only obtain a hearing by studied moderation of language, and the most cautious avoidance of unnecessary offence, from which they hardly ever deviate even in a slight degree without losing ground: while unmeasured vituperation employed on the side of the prevailing opinion, really does deter people from professing contrary opinions, and from listening to those who profess them. For the interest, therefore, of truth and justice, it is far more important to restrain this employment of vituperative language than the other; and, for example, if it

were necessary to choose, there would be much more need to discourage offensive attacks on infidelity, than on religion. It is, however, obvious that law and authority have no business with restraining either, while opinion ought, in every instance, to determine its verdict by the circumstances of the individual case; condemning every one, on whichever side of the argument he places himself, in whose mode of advocacy either want of candour, or malignity, bigotry, or intolerance of feeling manifest themselves; but not inferring these vices from the side which a person takes, though it be the contrary side of the question to our own: and giving merited honour to every one, whatever opinion he may hold, who has calmness to see and honesty to state what his opponents and their opinions really are, exaggerating nothing to their discredit, keeping nothing back which tells, or can be supposed to tell, in their favour. This is the real morality of public discussion; and if often violated, I am happy to think that there are many controversialists who to a great extent observe it, and a still greater number who conscientiously strive towards it.

FOOTNOTES:

[6] These words had scarcely been written, when, as if to give them an emphatic contradiction, occurred the Government Press Prosecutions of 1858. That ill-judged interference with the liberty of public discussion has not, however, induced me to alter a single word in the text, nor has it at all weakened my conviction that, moments of panic excepted, the era of pains and penalties for political discussion has, in our own country, passed away. For, in the first place, the prosecutions were not persisted in; and, in the second, they were never, properly speaking, political prosecutions. The offence charged was not that of criticising institutions, or the acts or persons of rulers, but of circulating what was deemed an immoral doctrine, the lawfulness of Tyrannicide.

If the arguments of the present chapter are of any validity, there ought to exist the fullest liberty of professing and discussing, as a matter of ethical conviction, any doctrine, however immoral it may be considered. It would, therefore, be irrelevant and out of place to examine here, whether the doctrine of Tyrannicide deserves that title. I shall content myself with saying, that the subject has been at all times one of the open questions of morals; that the act of a private citizen in striking down a criminal, who, by raising himself above the law, has placed himself beyond the reach of legal punishment or control, has been accounted by whole nations, and by some of the best and wisest of men, not a crime, but an act of exalted virtue; and that, right or wrong, it is not of the nature of assassination, but of civil war. As such, I hold that the instigation to it, in a specific case, may be a proper subject of punishment, but only if an overt act has followed, and at least a probable connection can be established between the act and the instigation. Even then, it is not a foreign government, but the very government assailed, which alone, in the exercise of self-defence, can legitimately punish attacks directed against its own existence.

[9] Baron de Gleichen, Marlborough-Street Police Court, August 4, 1857.

[10] Ample warning may be drawn from the large infusion of the passions of a persecutor, which mingled with the general display of the worst parts of our national character on the occasion of the Sepoy insurrection. The ravings of fanatics or charlatans from the pulpit may be unworthy of notice; but the heads of the Evangelical party have announced as their principle, for the government of Hindoos and Mahomedans, that no schools be supported by public money in which the Bible is not taught, and by necessary consequence that no public employment be given to any but real or pretended Christians. An Under-Secretary of State, in a speech delivered to his constituents on the 12th of November, 1857, is reported to have said: "Toleration of their faith" (the faith of a hundred millions of British subjects), "the superstition which they called religion, by the British Government, had had the effect of retarding the ascendency of the British name, and preventing the salutary growth of Christianity.... Toleration was the great corner-stone of the religious liberties of this country; but do not let them abuse that precious word toleration. As he understood it, it meant the complete liberty to all, freedom of worship, _among Christians, who worshipped upon the same foundation_. It meant toleration of all sects and denominations of _Christians who believed in the one mediation_." I desire to call attention to the fact, that a man who has been deemed fit to fill a high office in the government of this country, under a liberal Ministry, maintains the doctrine that all who do not believe in the divinity of Christ are beyond the pale of toleration. Who, after this imbecile display, can indulge the illusion that religious persecution has passed away, never to return?

CHAPTER III.

OF INDIVIDUALITY, AS ONE OF THE ELEMENTS OF WELL-BEING.

Such being the reasons which make it imperative that human beings should be free to form opinions, and to express their opinions without reserve; and such the baneful consequences to the intellectual, and through that to the moral nature of man, unless this liberty is either conceded, or asserted in spite of prohibition; let us next examine whether the same reasons do not require that men should be free to act upon their opinions--to carry these out in their lives, without hindrance, either physical or moral, from their fellow-men, so long as it is at their own risk and peril. This last proviso is of course indispensable. No one pretends that actions should be as free as opinions. On the contrary, even opinions lose their immunity, when the circumstances in which they are expressed are such as to constitute their expression a positive instigation to some mischievous act. An opinion that corn-dealers are starvers of the poor, or that private property is robbery, ought to be unmolested when simply circulated through the press, but may justly incur punishment when delivered orally to an excited mob assembled before the house of a corn-dealer, or when handed about among the same mob in the form of a placard. Acts, of whatever kind, which, without justifiable cause, do harm to others, may be, and in the more important cases absolutely require to be, controlled by the unfavourable sentiments, and, when needful, by the active interference of mankind. The liberty of the individual must be thus far limited; he must not make himself a nuisance to other people. But if he refrains from molesting others in what concerns them, and merely acts according to his own inclination and judgment in things which concern himself, the same reasons which show that opinion should be free, prove also that he should be allowed, without molestation, to carry his opinions into practice at his own cost. That mankind are not infallible; that their truths, for the most part, are only half-truths; that unity of opinion, unless resulting from the fullest and freest comparison of opposite opinions, is not desirable, and diversity not an evil, but a good, until mankind are much more capable than at present of recognising all sides of the truth, are principles applicable to men's modes of action, not less than to their opinions. As it is useful that while mankind are imperfect there should be different opinions, so is it that there should be different experiments of living; that free scope should be given to varieties of character, short of injury to others; and that the worth of different modes of life should be proved practically, when any one thinks fit to try them. It is desirable, in short, that in things which do not primarily concern others, individuality should assert itself. Where, not the person's own character, but the traditions or customs of other people are the rule of conduct, there is wanting one of the principal ingredients of human happiness, and quite the chief ingredient of individual and social progress.

In maintaining this principle, the greatest difficulty to be encountered does not lie in the appreciation of means towards an acknowledged end, but in the indifference of persons in general to the end itself. If it were felt that the free development of individuality is one of the leading essentials of well-being; that it is not only a co-ordinate element with all that is designated by the terms civilisation, instruction, education, culture, but is itself a necessary part and condition of all those things; there would be no danger that liberty should be under-valued, and the adjustment of the boundaries between it and social control would present no extraordinary difficulty. But the evil is, that individual spontaneity is hardly recognised by the common modes of thinking, as having any intrinsic worth, or deserving any regard on its own account. The majority, being satisfied with the ways of mankind as they now are (for it is they who make them what they are), cannot comprehend why those ways should not be good enough for everybody; and what is more, spontaneity forms no part of the ideal of the majority of moral and social reformers, but is rather looked on with jealousy, as a troublesome and perhaps rebellious obstruction to the general acceptance of what these reformers, in their own judgment, think would be best for mankind. Few persons, out of Germany, even comprehend the meaning of the doctrine which Wilhelm von Humboldt, so eminent both as a _savant_ and as a politician, made the text of a treatise--that "the end of man, or that which is prescribed by the eternal or immutable dictates of reason, and not suggested by vague and transient desires, is the highest and most harmonious development of his powers to a complete and consistent whole;" that, therefore, the object "towards which every human being must ceaselessly direct his efforts, and on which especially those who design to influence their fellow-men must ever keep their eyes, is the individuality of power and development;" that for this there are two requisites, "freedom, and a variety of situations;" and that from the union of these arise "individual vigour and manifold diversity," which combine themselves in "originality."[11]

Little, however, as people are accustomed to a doctrine like that of Von Humboldt, and surprising as it may be to them to find so high a value attached to individuality, the question, one must nevertheless think, can only be one of degree. No one's idea of excellence in conduct is that people should do absolutely nothing but copy one another. No one would assert that people ought not to put into their mode of life, and into the conduct of their concerns, any impress whatever of their own judgment, or of their own individual character. On the other hand, it would be absurd to pretend that people ought to live as if nothing whatever had been known in the world before they came into it; as if experience had as yet done nothing towards showing that one mode of existence, or of conduct, is preferable to another. Nobody denies that people should be so taught and trained in youth, as to know and benefit by the ascertained results of human experience. But it is the privilege and proper condition of a human being, arrived at the maturity of his faculties, to use and interpret experience in his own way. It is for him to find out what part of recorded experience is properly

applicable to his own circumstances and character. The traditions and customs of other people are, to a certain extent, evidence of what their experience has taught _them_; presumptive evidence, and as such, have a claim to his deference: but, in the first place, their experience may be too narrow; or they may not have interpreted it rightly. Secondly, their interpretation of experience may be correct, but unsuitable to him. Customs are made for customary circumstances, and customary characters: and his circumstances or his character may be uncustomary. Thirdly, though the customs be both good as customs, and suitable to him, yet to conform to custom, merely _as_ custom, does not educate or develop in him any of the qualities which are the distinctive endowment of a human being. The human faculties of perception, judgment, discriminative feeling, mental activity, and even moral preference, are exercised only in making a choice. He who does anything because it is the custom, makes no choice. He gains no practice either in discerning or in desiring what is best. The mental and moral, like the muscular powers, are improved only by being used. The faculties are called into no exercise by doing a thing merely because others do it, no more than by believing a thing only because others believe it. If the grounds of an opinion are not conclusive to the person's own reason, his reason cannot be strengthened, but is likely to be weakened by his adopting it: and if the inducements to an act are not such as are consentaneous to his own feelings and character (where affection, or the rights of others, are not concerned), it is so much done towards rendering his feelings and character inert and torpid, instead of active and energetic.

He who lets the world, or his own portion of it, choose his plan of life for him, has no need of any other faculty than the ape-like one of imitation. He who chooses his plan for himself, employs all his faculties. He must use observation to see, reasoning and judgment to foresee, activity to gather materials for decision, discrimination to decide, and when he has decided, firmness and self-control to hold to his deliberate decision. And these qualities he requires and exercises exactly in proportion as the part of his conduct which he determines according to his own judgment and feelings is a large one. It is possible that he might be guided in some good path, and kept out of harm's way, without any of these things. But what will be his comparative worth as a human being? It really is of importance, not only what men do, but also what manner of men they are that do it. Among the works of man, which human life is rightly employed in perfecting and beautifying, the first in importance surely is man himself. Supposing it were possible to get houses built, corn grown, battles fought, causes tried, and even churches erected and prayers said, by machinery--by automatons in human form--it would be a considerable loss to exchange for these automatons even the men and women who at present inhabit the more civilised parts of the world, and who assuredly are but starved specimens of what nature can and will produce. Human nature is not a machine to be built after a model, and set to do exactly the work prescribed for it, but a tree, which requires to grow and develop itself on all sides, according to the tendency of the inward forces which make it a living thing.

It will probably be conceded that it is desirable people should exercise their understandings, and that an intelligent following of custom, or even occasionally an intelligent deviation from custom, is better than a blind and simply mechanical adhesion to it. To a certain extent it is admitted, that our understanding should be our own: but there is not the same willingness to admit that our desires and impulses should be our own likewise; or that to possess impulses of our own, and of any strength, is anything but a peril and a snare. Yet desires and impulses are as much a part of a perfect human being, as beliefs and restraints: and strong impulses are only perilous when not properly balanced; when one set of aims and inclinations is developed into strength, while others, which ought to co-exist with them, remain weak and inactive. It is not because men's desires are strong that they act ill; it is because their consciences are weak. There is no natural connection between strong impulses and a weak conscience. The natural connection is the other way. To say that one person's desires and feelings are stronger and more various than those of another, is merely to say that he has more of the raw material of human nature, and is therefore capable, perhaps of more evil, but certainly of more good. Strong impulses are but another name for energy. Energy may be turned to bad uses; but more good may always be made of an energetic nature, than of an indolent and impassive one. Those who have most natural feeling, are always those whose cultivated feelings may be made the strongest. The same strong susceptibilities which make the personal impulses vivid and powerful, are also the source from whence are generated the most passionate love of virtue, and the sternest self-control. It is through the cultivation of these, that society both does its duty and protects its interests: not by rejecting the stuff of which heroes are made, because it knows not how to make them. A person whose desires and impulses are his own--are the expression of his own nature, as it has been developed and modified by his own culture--is said to have a character. One whose desires and impulses are not his own, has no character, no more than a steam-engine has a character. If, in addition to being his own, his impulses are strong, and are under the government of a strong will, he has an energetic character. Whoever thinks that individuality of desires and impulses should not be encouraged to unfold itself, must maintain that society has no need of strong natures--is not the better for containing many persons who have much character--and that a high general average of energy is not desirable.

In some early states of society, these forces might be, and were, too much ahead of the power which society then possessed of disciplining and controlling them. There has been a time when the element of spontaneity and individuality was in excess, and the social principle had a hard struggle with it. The difficulty then was, to induce men of strong bodies or minds to pay obedience to any rules which required them to control their impulses. To overcome this difficulty, law and discipline, like the Popes struggling against the Emperors, asserted a power over the whole man, claiming to control all his life in order to control his character--which society had not found any other sufficient means of binding. But society has now fairly got the better of individuality; and the danger which threatens human nature is not the excess, but the deficiency, of personal impulses and preferences. Things are vastly changed, since the passions of those who were strong by station or by personal endowment were in a state of habitual rebellion against laws and ordinances, and required to be rigorously chained up to enable the persons within their reach to enjoy any particle of security. In our times, from the highest class of society down to the lowest, every one lives as under the eye of a hostile and dreaded censorship. Not only in what concerns others, but in what concerns only themselves, the individual, or the family, do not ask themselves--what do I prefer? or, what would suit my character and disposition? or, what would allow the best and highest in me to have fair-play, and enable it to grow and thrive? They ask themselves, what is suitable to my position? what is usually done by persons of my station and pecuniary circumstances? or (worse still) what is usually done by persons of a station and circumstances superior to mine? I do not mean that they choose what is customary, in preference to what suits their own inclination. It does not occur to them to have any inclination, except for what is customary. Thus the mind itself is bowed to the yoke: even in what people do for pleasure, conformity is the first thing thought of; they live in crowds; they exercise choice only among things commonly done: peculiarity of taste, eccentricity of conduct, are shunned equally with crimes: until by dint of not following their own nature, they have no nature to follow: their human capacities are withered and starved: they become incapable of any strong wishes or native pleasures, and are generally without either opinions or feelings of home growth, or properly their own. Now is this, or is it not, the desirable condition of human nature?

It is so, on the Calvinistic theory. According to that, the one great offence of man is Self-will. All the good of which humanity is capable, is comprised in Obedience. You have no choice; thus you must do, and no otherwise: "whatever is not a duty, is a sin." Human nature being radically corrupt, there is no redemption for any one until human nature is killed within him. To one holding this theory of life, crushing out any of the human faculties, capacities, and susceptibilities, is no evil: man needs no capacity, but that of surrendering himself to the will of God: and if he uses any of his faculties for any other purpose but to do that supposed will more effectually, he is better without them. That is the theory of Calvinism; and it is held, in a mitigated form, by many who do not consider themselves Calvinists; the mitigation consisting in giving a less ascetic interpretation to the alleged will of God; asserting it to be his will that mankind should gratify some of their inclinations; of course not in the manner they themselves prefer, but in the way of obedience, that is, in a way prescribed to them by authority; and, therefore, by the necessary conditions of the case, the same for all.

In some such insidious form there is at present a strong tendency to this narrow theory of life, and to the pinched and hidebound type of human character which it patronises. Many persons, no doubt, sincerely think that human beings thus cramped and dwarfed, are as their Maker designed them to be; just as many have thought that trees are a much finer thing when clipped into pollards, or cut out into figures of animals, than as nature made them. But if it be any part of religion to believe that man was made by a good being, it is more consistent with that faith to believe, that this Being gave all human faculties that they might be cultivated and unfolded, not rooted out and consumed, and that he takes delight in every nearer approach made by his creatures to the ideal conception embodied in them, every increase in any of their capabilities of comprehension, of action, or of enjoyment. There is a different type of human excellence from the Calvinistic; a conception of humanity as having its nature bestowed on it for other purposes than merely to be abnegated. "Pagan self-assertion" is one of the elements of human worth, as well as "Christian self-denial."[12] There is a Greek ideal of self-development, which the Platonic and Christian ideal of self-government blends with, but does not supersede. It may be better to be a John Knox than an Alcibiades, but it is better to be a Pericles than either; nor would a Pericles, if we had one in these days, be without anything good which belonged to John Knox.

It is not by wearing down into uniformity all that is individual in themselves, but by cultivating it and calling it forth, within the limits imposed by the rights and interests of others, that human beings become a noble and beautiful object of contemplation; and as the works partake the character of those who do them, by the same process human life also becomes rich, diversified, and animating, furnishing more abundant aliment to high thoughts and elevating feelings, and strengthening the tie which binds every individual to the race, by making the race infinitely better worth belonging to. In proportion to the development of his individuality, each person becomes more valuable to himself, and is therefore capable of being more valuable to others. There is a greater fulness of life about his own existence, and when there is more life in the units there is more in the mass which is composed of them. As much

compression as is necessary to prevent the stronger specimens of human nature from encroaching on the rights of others, cannot be dispensed with; but for this there is ample compensation even in the point of view of human development. The means of development which the individual loses by being prevented from gratifying his inclinations to the injury of others, are chiefly obtained at the expense of the development of other people. And even to himself there is a full equivalent in the better development of the social part of his nature, rendered possible by the restraint put upon the selfish part. To be held to rigid rules of justice for the sake of others, develops the feelings and capacities which have the good of others for their object. But to be restrained in things not affecting their good, by their mere displeasure, develops nothing valuable, except such force of character as may unfold itself in resisting the restraint. If acquiesced in, it dulls and blunts the whole nature. To give any fair-play to the nature of each, it is essential that different persons should be allowed to lead different lives. In proportion as this latitude has been exercised in any age, has that age been noteworthy to posterity. Even despotism does not produce its worst effects, so long as Individuality exists under it; and whatever crushes individuality is despotism, by whatever name it may be called, and whether it professes to be enforcing the will of God or the injunctions of men.

Having said that Individuality is the same thing with development, and that it is only the cultivation of individuality which produces, or can produce, well-developed human beings, I might here close the argument: for what more or better can be said of any condition of human affairs, than that it brings human beings themselves nearer to the best thing they can be? or what worse can be said of any obstruction to good, than that it prevents this? Doubtless, however, these considerations will not suffice to convince those who most need convincing; and it is necessary further to show, that these developed human beings are of some use to the undeveloped--to point out to those who do not desire liberty, and would not avail themselves of it, that they may be in some intelligible manner rewarded for allowing other people to make use of it without hindrance.

In the first place, then, I would suggest that they might possibly learn something from them. It will not be denied by anybody, that originality is a valuable element in human affairs. There is always need of persons not only to discover new truths, and point out when what were once truths are true no longer, but also to commence new practices, and set the example of more enlightened conduct, and better taste and sense in human life. This cannot well be gainsaid by anybody who does not believe that the world has already attained perfection in all its ways and practices. It is true that this benefit is not capable of being rendered by everybody alike: there are but few persons, in comparison with the whole of mankind, whose experiments, if adopted by others, would be likely to be any improvement on established practice. But these few are the salt of the earth; without them, human life would become a stagnant pool. Not only is it they who introduce good things which did not before exist; it is they who keep the life in those which already existed. If there were nothing new to be done, would human intellect cease to be necessary? Would it be a reason why those who do the old things should forget why they are done, and do them like cattle, not like human beings? There is only too great a tendency in the best beliefs and practices to degenerate into the mechanical; and unless there were a succession of persons whose ever-recurring originality prevents the grounds of those beliefs and practices from becoming merely traditional, such dead matter would not resist the smallest shock from anything really alive, and there would be no reason why civilisation should not die out, as in the Byzantine Empire. Persons of genius, it is true, are, and are always likely to be, a small minority; but in order to have them, it is necessary to preserve the soil in which they grow. Genius can only breathe freely in an _atmosphere_ of freedom. Persons of genius are, _ex vi termini_, _more_ individual than any other people--less capable, consequently, of fitting themselves, without hurtful compression, into any of the small number of moulds which society provides in order to save its members the trouble of forming their own character. If from timidity they consent to be forced into one of these moulds, and to let all that part of themselves which cannot expand under the pressure remain unexpanded, society will be little the better for their genius. If they are of a strong character, and break their fetters, they become a mark for the society which has not succeeded in reducing them to commonplace, to point at with solemn warning as "wild," "erratic," and the like; much as if one should complain of the Niagara river for not flowing smoothly between its banks like a Dutch canal.

I insist thus emphatically on the importance of genius, and the necessity of allowing it to unfold itself freely both in thought and in practice, being well aware that no one will deny the position in theory, but knowing also that almost every one, in reality, is totally indifferent to it. People think genius a fine thing if it enables a man to write an exciting poem, or paint a picture. But in its true sense, that of originality in thought and action, though no one says that it is not a thing to be admired, nearly all, at heart, think that they can do very well without it. Unhappily this is too natural to be wondered at. Originality is the one thing which unoriginal minds cannot feel the use of. They cannot see what it is to do for them: how should they? If they could see what it would do for them, it would not be originality. The first service which originality has to render them, is that of opening their eyes: which being once fully done, they would have a chance of being themselves original. Meanwhile, recollecting that nothing was ever yet done which some one was not the first to do, and that all good things which exist are the fruits of originality, let them be modest enough to believe that

there is something still left for it to accomplish, and assure themselves that they are more in need of originality, the less they are conscious of the want.

In sober truth, whatever homage may be professed, or even paid, to real or supposed mental superiority, the general tendency of things throughout the world is to render mediocrity the ascendant power among mankind. In ancient history, in the middle ages, and in a diminishing degree through the long transition from feudality to the present time, the individual was a power in himself; and if he had either great talents or a high social position, he was a considerable power. At present individuals are lost in the crowd. In politics it is almost a triviality to say that public opinion now rules the world. The only power deserving the name is that of masses, and of governments while they make themselves the organ of the tendencies and instincts of masses. This is as true in the moral and social relations of private life as in public transactions. Those whose opinions go by the name of public opinion, are not always the same sort of public: in America they are the whole white population; in England, chiefly the middle class. But they are always a mass, that is to say, collective mediocrity. And what is a still greater novelty, the mass do not now take their opinions from dignitaries in Church or State, from ostensible leaders, or from books. Their thinking is done for them by men much like themselves, addressing them or speaking in their name, on the spur of the moment, through the newspapers. I am not complaining of all this. I do not assert that anything better is compatible, as a general rule, with the present low state of the human mind. But that does not hinder the government of mediocrity from being mediocre government. No government by a democracy or a numerous aristocracy, either in its political acts or in the opinions, qualities, and tone of mind which it fosters, ever did or could rise above mediocrity, except in so far as the sovereign Many have let themselves be guided (which in their best times they always have done) by the counsels and influence of a more highly gifted and instructed One or Few. The initiation of all wise or noble things, comes and must come from individuals; generally at first from some one individual. The honour and glory of the average man is that he is capable of following that initiative; that he can respond internally to wise and noble things, and be led to them with his eyes open. I am not countenancing the sort of "hero-worship" which applauds the strong man of genius for forcibly seizing on the government of the world and making it do his bidding in spite of itself. All he can claim is, freedom to point out the way. The power of compelling others into it, is not only inconsistent with the freedom and development of all the rest, but corrupting to the strong man himself. It does seem, however, that when the opinions of masses of merely average men are everywhere become or becoming the dominant power, the counterpoise and corrective to that tendency would be, the more and more pronounced individuality of those who stand on the higher eminences of thought. It is in these circumstances most especially, that exceptional individuals, instead of being deterred, should be encouraged in acting differently from the mass. In other times there was no advantage in their doing so, unless they acted not only differently, but better. In this age the mere example of nonconformity, the mere refusal to bend the knee to custom, is itself a service. Precisely because the tyranny of opinion is such as to make eccentricity a reproach, it is desirable, in order to break through that tyranny, that people should be eccentric. Eccentricity has always abounded when and where strength of character has abounded; and the amount of eccentricity in a society has generally been proportional to the amount of genius, mental vigour, and moral courage which it contained. That so few now dare to be eccentric, marks the chief danger of the time.

I have said that it is important to give the freest scope possible to uncustomary things, in order that it may in time appear which of these are fit to be converted into customs. But independence of action, and disregard of custom are not solely deserving of encouragement for the chance they afford that better modes of action, and customs more worthy of general adoption, may be struck out; nor is it only persons of decided mental superiority who have a just claim to carry on their lives in their own way. There is no reason that all human existences should be constructed on some one, or some small number of patterns. If a person possesses any tolerable amount of common-sense and experience, his own mode of laying out his existence is the best, not because it is the best in itself, but because it is his own mode. Human beings are not like sheep; and even sheep are not undistinguishably alike. A man cannot get a coat or a pair of boots to fit him, unless they are either made to his measure, or he has a whole warehouseful to choose from: and is it easier to fit him with a life than with a coat, or are human beings more like one another in their whole physical and spiritual conformation than in the shape of their feet? If it were only that people have diversities of taste, that is reason enough for not attempting to shape them all after one model. But different persons also require different conditions for their spiritual development; and can no more exist healthily in the same moral, than all the variety of plants can in the same physical, atmosphere and climate. The same things which are helps to one person towards the cultivation of his higher nature, are hindrances to another. The same mode of life is a healthy excitement to one, keeping all his faculties of action and enjoyment in their best order, while to another it is a distracting burthen, which suspends or crushes all internal life. Such are the differences among human beings in their sources of pleasure, their susceptibilities of pain, and the operation on them of different physical and moral agencies, that unless there is a corresponding diversity in their modes of life, they neither obtain their fair share of happiness, nor grow up to the mental, moral, and aesthetic stature of which their nature is capable. Why then should tolerance, as far as the public sentiment is

concerned, extend only to tastes and modes of life which extort acquiescence by the multitude of their adherents? Nowhere (except in some monastic institutions) is diversity of taste entirely unrecognised; a person may, without blame, either like or dislike rowing, or smoking, or music, or athletic exercises, or chess, or cards, or study, because both those who like each of these things, and those who dislike them, are too numerous to be put down. But the man, and still more the woman, who can be accused either of doing "what nobody does," or of not doing "what everybody does," is the subject of as much depreciatory remark as if he or she had committed some grave moral delinquency. Persons require to possess a title, or some other badge of rank, or of the consideration of people of rank, to be able to indulge somewhat in the luxury of doing as they like without detriment to their estimation. To indulge somewhat, I repeat: for whoever allow themselves much of that indulgence, incur the risk of something worse than disparaging speeches--they are in peril of a commission _de lunatico_, and of having their property taken from them and given to their relations.[13]

There is one characteristic of the present direction of public opinion, peculiarly calculated to make it intolerant of any marked demonstration of individuality. The general average of mankind are not only moderate in intellect, but also moderate in inclinations: they have no tastes or wishes strong enough to incline them to do anything unusual, and they consequently do not understand those who have, and class all such with the wild and intemperate whom they are accustomed to look down upon. Now, in addition to this fact which is general, we have only to suppose that a strong movement has set in towards the improvement of morals, and it is evident what we have to expect. In these days such a movement has set in; much has actually been effected in the way of increased regularity of conduct, and discouragement of excesses; and there is a philanthropic spirit abroad, for the exercise of which there is no more inviting field than the moral and prudential improvement of our fellow-creatures. These tendencies of the times cause the public to be more disposed than at most former periods to prescribe general rules of conduct, and endeavour to make every one conform to the approved standard. And that standard, express or tacit, is to desire nothing strongly. Its ideal of character is to be without any marked character; to maim by compression, like a Chinese lady's foot, every part of human nature which stands out prominently, and tends to make the person markedly dissimilar in outline to commonplace humanity.

As is usually the case with ideals which exclude one-half of what is desirable, the present standard of approbation produces only an inferior imitation of the other half. Instead of great energies guided by vigorous reason, and strong feelings strongly controlled by a conscientious will, its result is weak feelings and weak energies, which therefore can be kept in outward conformity to rule without any strength either of will or of reason. Already energetic characters on any large scale are becoming merely traditional. There is now scarcely any outlet for energy in this country except business. The energy expended in that may still be regarded as considerable. What little is left from that employment, is expended on some hobby; which may be a useful, even a philanthropic hobby, but is always some one thing, and generally a thing of small dimensions. The greatness of England is now all collective: individually small, we only appear capable of anything great by our habit of combining; and with this our moral and religious philanthropists are perfectly contented. But it was men of another stamp than this that made England what it has been; and men of another stamp will be needed to prevent its decline.

The despotism of custom is everywhere the standing hindrance to human advancement, being in unceasing antagonism to that disposition to aim at something better than customary, which is called, according to circumstances, the spirit of liberty, or that of progress or improvement. The spirit of improvement is not always a spirit of liberty, for it may aim at forcing improvements on an unwilling people; and the spirit of liberty, in so far as it resists such attempts, may ally itself locally and temporarily with the opponents of improvement; but the only unfailing and permanent source of improvement is liberty, since by it there are as many possible independent centres of improvement as there are individuals. The progressive principle, however, in either shape, whether as the love of liberty or of improvement, is antagonistic to the sway of Custom, involving at least emancipation from that yoke; and the contest between the two constitutes the chief interest of the history of mankind. The greater part of the world has, properly speaking, no history, because the despotism of Custom is complete. This is the case over the whole East. Custom is there, in all things, the final appeal; justice and right mean conformity to custom; the argument of custom no one, unless some tyrant intoxicated with power, thinks of resisting. And we see the result. Those nations must once have had originality; they did not start out of the ground populous, lettered, and versed in many of the arts of life; they made themselves all this, and were then the greatest and most powerful nations in the world. What are they now? The subjects or dependants of tribes whose forefathers wandered in the forests when theirs had magnificent palaces and gorgeous temples, but over whom custom exercised only a divided rule with liberty and progress. A people, it appears, may be progressive for a certain length of time, and then stop: when does it stop? When it ceases to possess individuality. If a similar change should befall the nations of Europe, it will not be in exactly the same shape: the despotism of custom with which these nations are threatened is not precisely stationariness. It proscribes singularity, but it does not preclude change, provided all change together. We have discarded the fixed costumes of our forefathers;

every one must still dress like other people, but the fashion may change once or twice a year. We thus take care that when there is change, it shall be for change's sake, and not from any idea of beauty or convenience; for the same idea of beauty or convenience would not strike all the world at the same moment, and be simultaneously thrown aside by all at another moment. But we are progressive as well as changeable: we continually make new inventions in mechanical things, and keep them until they are again superseded by better; we are eager for improvement in politics, in education, even in morals, though in this last our idea of improvement chiefly consists in persuading or forcing other people to be as good as ourselves. It is not progress that we object to; on the contrary, we flatter ourselves that we are the most progressive people who ever lived. It is individuality that we war against: we should think we had done wonders if we had made ourselves all alike; forgetting that the unlikeness of one person to another is generally the first thing which draws the attention of either to the imperfection of his own type, and the superiority of another, or the possibility, by combining the advantages of both, of producing something better than either. We have a warning example in China--a nation of much talent, and, in some respects, even wisdom, owing to the rare good fortune of having been provided at an early period with a particularly good set of customs, the work, in some measure, of men to whom even the most enlightened European must accord, under certain limitations, the title of sages and philosophers. They are remarkable, too, in the excellence of their apparatus for impressing, as far as possible, the best wisdom they possess upon every mind in the community, and securing that those who have appropriated most of it shall occupy the posts of honour and power. Surely the people who did this have discovered the secret of human progressiveness, and must have kept themselves steadily at the head of the movement of the world. On the contrary, they have become stationary--have remained so for thousands of years; and if they are ever to be farther improved, it must be by foreigners. They have succeeded beyond all hope in what English philanthropists are so industriously working at--in making a people all alike, all governing their thoughts and conduct by the same maxims and rules; and these are the fruits. The modern _regime_ of public opinion is, in an unorganised form, what the Chinese educational and political systems are in an organised; and unless individuality shall be able successfully to assert itself against this yoke, Europe, notwithstanding its noble antecedents and its professed Christianity, will tend to become another China.

What is it that has hitherto preserved Europe from this lot? What has made the European family of nations an improving, instead of a stationary portion of mankind? Not any superior excellence in them, which, when it exists, exists as the effect, not as the cause; but their remarkable diversity of character and culture. Individuals, classes, nations, have been extremely unlike one another: they have struck out a great variety of paths, each leading to something valuable; and although at every period those who travelled in different paths have been intolerant of one another, and each would have thought it an excellent thing if all the rest could have been compelled to travel his road, their attempts to thwart each other's development have rarely had any permanent success, and each has in time endured to receive the good which the others have offered. Europe is, in my judgment, wholly indebted to this plurality of paths for its progressive and many-sided development. But it already begins to possess this benefit in a considerably less degree. It is decidedly advancing towards the Chinese ideal of making all people alike. M. de Tocqueville, in his last important work, remarks how much more the Frenchmen of the present day resemble one another, than did those even of the last generation. The same remark might be made of Englishmen in a far greater degree. In a passage already quoted from Wilhelm von Humboldt, he points out two things as necessary conditions of human development, because necessary to render people unlike one another; namely, freedom, and variety of situations. The second of these two conditions is in this country every day diminishing. The circumstances which surround different classes and individuals, and shape their characters, are daily becoming more assimilated. Formerly, different ranks, different neighbourhoods, different trades and professions, lived in what might be called different worlds; at present, to a great degree in the same. Comparatively speaking, they now read the same things, listen to the same things, see the same things, go to the same places, have their hopes and fears directed to the same objects, have the same rights and liberties, and the same means of asserting them. Great as are the differences of position which remain, they are nothing to those which have ceased. And the assimilation is still proceeding. All the political changes of the age promote it, since they all tend to raise the low and to lower the high. Every extension of education promotes it, because education brings people under common influences, and gives them access to the general stock of facts and sentiments. Improvements in the means of communication promote it, by bringing the inhabitants of distant places into personal contact, and keeping up a rapid flow of changes of residence between one place and another. The increase of commerce and manufactures promotes it, by diffusing more widely the advantages of easy circumstances, and opening all objects of ambition, even the highest, to general competition, whereby the desire of rising becomes no longer the character of a particular class, but of all classes. A more powerful agency than even all these, in bringing about a general similarity among mankind, is the complete establishment, in this and other free countries, of the ascendency of public opinion in the State. As the various social eminences which enabled persons entrenched on them to disregard the opinion of the multitude, gradually become levelled; as the very idea of resisting the will of the public, when it is positively known that they have a will, disappears more and more from the minds of practical politicians; there ceases to be any

social support for non-conformity--any substantive power in society, which, itself opposed to the ascendency of numbers, is interested in taking under its protection opinions and tendencies at variance with those of the public.

The combination of all these causes forms so great a mass of influences hostile to Individuality, that it is not easy to see how it can stand its ground. It will do so with increasing difficulty, unless the intelligent part of the public can be made to feel its value--to see that it is good there should be differences, even though not for the better, even though, as it may appear to them, some should be for the worse. If the claims of Individuality are ever to be asserted, the time is now, while much is still wanting to complete the enforced assimilation. It is only in the earlier stages that any stand can be successfully made against the encroachment. The demand that all other people shall resemble ourselves, grows by what it feeds on. If resistance waits till life is reduced _nearly_ to one uniform type, all deviations from that type will come to be considered impious, immoral, even monstrous and contrary to nature. Mankind speedily become unable to conceive diversity, when they have been for some time unaccustomed to see it.

FOOTNOTES:

[11] _The Sphere and Duties of Government_, from the German of Baron Wilhelm von Humboldt, pp. 11-13.

[12] Sterling's _Essays_.

[13] There is something both contemptible and frightful in the sort of evidence on which, of late years, any person can be judicially declared unfit for the management of his affairs; and after his death, his disposal of his property can be set aside, if there is enough of it to pay the expenses of litigation--which are charged on the property itself. All the minute details of his daily life are pried into, and whatever is found which, seen through the medium of the perceiving and describing faculties of the lowest of the low, bears an appearance unlike absolute commonplace, is laid before the jury as evidence of insanity, and often with success; the jurors being little, if at all, less vulgar and ignorant than the witnesses; while the judges, with that extraordinary want of knowledge of human nature and life which continually astonishes us in English lawyers, often help to mislead them. These trials speak volumes as to the state of feeling and opinion among the vulgar with regard to human liberty. So far from setting any value on individuality--so far from respecting the rights of each individual to act, in things indifferent, as seems good to his own judgment and inclinations, judges and juries cannot even conceive that a person in a state of sanity can desire such freedom. In former days, when it was proposed to burn atheists, charitable people used to suggest putting them in a madhouse instead: it would be nothing surprising nowadays were we to see this done, and the doers applauding themselves, because, instead of persecuting for religion, they had adopted so humane and Christian a mode of treating these unfortunates, not without a silent satisfaction at their having thereby obtained their deserts.

CHAPTER IV.

OF THE LIMITS TO THE AUTHORITY OF SOCIETY OVER THE INDIVIDUAL.

What, then, is the rightful limit to the sovereignty of the individual over himself? Where does the authority of society begin? How much of human life should be assigned to individuality, and how much to society?

Each will receive its proper share, if each has that which more particularly concerns it. To individuality should belong the part of life in which it is chiefly the individual that is interested; to society, the part which chiefly interests society.

Though society is not founded on a contract, and though no good purpose is answered by inventing a contract in order to deduce social obligations from it, every one who receives the protection of society owes a return for the benefit, and the fact of living in society renders it indispensable that each should be bound to observe a certain line of conduct towards the rest. This conduct consists, first, in not injuring the interests of one another; or rather certain interests which, either by express legal provision or by tacit understanding, ought to be considered as rights; and secondly, in each person's bearing his share (to be fixed on some equitable principle) of the labours and sacrifices incurred for defending the society or its members from injury and molestation. These conditions society is justified in enforcing, at all costs to those who endeavour to withhold fulfilment. Nor is this all that society may do. The acts of an individual may be hurtful to others, or wanting in due consideration for their welfare, without going the length of violating any of their constituted rights. The offender may then be justly punished by opinion though not by law. As soon as any part of a person's conduct affects prejudicially the interests of others, society has jurisdiction over it, and the question whether the general welfare will or will not be promoted by interfering with it, becomes open to discussion. But there is no room for entertaining any such question when a person's conduct affects the interests of no persons besides himself, or needs not affect

them unless they like (all the persons concerned being of full age, and the ordinary amount of understanding). In all such cases there should be perfect freedom, legal and social, to do the action and stand the consequences.

It would be a great misunderstanding of this doctrine, to suppose that it is one of selfish indifference, which pretends that human beings have no business with each other's conduct in life, and that they should not concern themselves about the well-doing or well-being of one another, unless their own interest is involved. Instead of any diminution, there is need of a great increase of disinterested exertion to promote the good of others. But disinterested benevolence can find other instruments to persuade people to their good, than whips and scourges, either of the literal or the metaphorical sort. I am the last person to undervalue the self-regarding virtues; they are only second in importance, if even second, to the social. It is equally the business of education to cultivate both. But even education works by conviction and persuasion as well as by compulsion, and it is by the former only that, when the period of education is past, the self-regarding virtues should be inculcated. Human beings owe to each other help to distinguish the better from the worse, and encouragement to choose the former and avoid the latter. They should be for ever stimulating each other to increased exercise of their higher faculties, and increased direction of their feelings and aims towards wise instead of foolish, elevating instead of degrading, objects and contemplations. But neither one person, nor any number of persons, is warranted in saying to another human creature of ripe years, that he shall not do with his life for his own benefit what he chooses to do with it. He is the person most interested in his own well-being: the interest which any other person, except in cases of strong personal attachment, can have in it, is trifling, compared with that which he himself has; the interest which society has in him individually (except as to his conduct to others) is fractional, and altogether indirect: while, with respect to his own feelings and circumstances, the most ordinary man or woman has means of knowledge immeasurably surpassing those that can be possessed by any one else. The interference of society to overrule his judgment and purposes in what only regards himself, must be grounded on general presumptions; which may be altogether wrong, and even if right, are as likely as not to be misapplied to individual cases, by persons no better acquainted with the circumstances of such cases than those are who look at them merely from without. In this department, therefore, of human affairs, Individuality has its proper field of action. In the conduct of human beings towards one another, it is necessary that general rules should for the most part be observed, in order that people may know what they have to expect; but in each person's own concerns, his individual spontaneity is entitled to free exercise. Considerations to aid his judgment, exhortations to strengthen his will, may be offered to him, even obtruded on him, by others; but he himself is the final judge. All errors which he is likely to commit against advice and warning, are far outweighed by the evil of allowing others to constrain him to what they deem his good.

I do not mean that the feelings with which a person is regarded by others, ought not to be in any way affected by his self-regarding qualities or deficiencies. This is neither possible nor desirable. If he is eminent in any of the qualities which conduce to his own good, he is, so far, a proper object of admiration. He is so much the nearer to the ideal perfection of human nature. If he is grossly deficient in those qualities, a sentiment the opposite of admiration will follow. There is a degree of folly, and a degree of what may be called (though the phrase is not unobjectionable) lowness or depravation of taste, which, though it cannot justify doing harm to the person who manifests it, renders him necessarily and properly a subject of distaste, or, in extreme cases, even of contempt: a person could not have the opposite qualities in due strength without entertaining these feelings. Though doing no wrong to any one, a person may so act as to compel us to judge him, and feel to him, as a fool, or as a being of an inferior order: and since this judgment and feeling are a fact which he would prefer to avoid, it is doing him a service to warn him of it beforehand, as of any other disagreeable consequence to which he exposes himself. It would be well, indeed, if this good office were much more freely rendered than the common notions of politeness at present permit, and if one person could honestly point out to another that he thinks him in fault, without being considered unmannerly or presuming. We have a right, also, in various ways, to act upon our unfavourable opinion of any one, not to the oppression of his individuality, but in the exercise of ours. We are not bound, for example, to seek his society; we have a right to avoid it (though not to parade the avoidance), for we have a right to choose the society most acceptable to us. We have a right, and it may be our duty, to caution others against him, if we think his example or conversation likely to have a pernicious effect on those with whom he associates. We may give others a preference over him in optional good offices, except those which tend to his improvement. In these various modes a person may suffer very severe penalties at the hands of others, for faults which directly concern only himself; but he suffers these penalties only in so far as they are the natural, and, as it were, the spontaneous consequences of the faults themselves, not because they are purposely inflicted on him for the sake of punishment. A person who shows rashness, obstinacy, self-conceit--who cannot live within moderate means--who cannot restrain himself from hurtful indulgences--who pursues animal pleasures at the expense of those of feeling and intellect--must expect to be lowered in the opinion of others, and to have a less share of their favourable sentiments; but of this he has no right to complain, unless he has merited their favour by special excellence in his social relations, and has thus established a

title to their good offices, which is not affected by his demerits towards himself.

What I contend for is, that the inconveniences which are strictly inseparable from the unfavourable judgment of others, are the only ones to which a person should ever be subjected for that portion of his conduct and character which concerns his own good, but which does not affect the interests of others in their relations with him. Acts injurious to others require a totally different treatment. Encroachment on their rights; infliction on them of any loss or damage not justified by his own rights; falsehood or duplicity in dealing with them; unfair or ungenerous use of advantages over them; even selfish abstinence from defending them against injury--these are fit objects of moral reprobation, and, in grave cases, of moral retribution and punishment. And not only these acts, but the dispositions which lead to them, are properly immoral, and fit subjects of disapprobation which may rise to abhorrence. Cruelty of disposition; malice and ill-nature; that most anti-social and odious of all passions, envy; dissimulation and insincerity; irascibility on insufficient cause, and resentment disproportioned to the provocation; the love of domineering over others; the desire to engross more than one's share of advantages (the [Greek: pleonexia] of the Greeks); the pride which derives gratification from the abasement of others; the egotism which thinks self and its concerns more important than everything else, and decides all doubtful questions in its own favour;--these are moral vices, and constitute a bad and odious moral character: unlike the self-regarding faults previously mentioned, which are not properly immoralities, and to whatever pitch they may be carried, do not constitute wickedness. They may be proofs of any amount of folly, or want of personal dignity and self-respect; but they are only a subject of moral reprobation when they involve a breach of duty to others, for whose sake the individual is bound to have care for himself. What are called duties to ourselves are not socially obligatory, unless circumstances render them at the same time duties to others. The term duty to oneself, when it means anything more than prudence, means self-respect or self-development; and for none of these is any one accountable to his fellow-creatures, because for none of them is it for the good of mankind that he be held accountable to them.

The distinction between the loss of consideration which a person may rightly incur by defect of prudence or of personal dignity, and the reprobation which is due to him for an offence against the rights of others, is not a merely nominal distinction. It makes a vast difference both in our feelings and in our conduct towards him, whether he displeases us in things in which we think we have a right to control him, or in things in which we know that we have not. If he displeases us, we may express our distaste, and we may stand aloof from a person as well as from a thing that displeases us; but we shall not therefore feel called on to make his life uncomfortable. We shall reflect that he already bears, or will bear, the whole penalty of his error; if he spoils his life by mismanagement, we shall not, for that reason, desire to spoil it still further: instead of wishing to punish him, we shall rather endeavour to alleviate his punishment, by showing him how he may avoid or cure the evils his conduct tends to bring upon him. He may be to us an object of pity, perhaps of dislike, but not of anger or resentment; we shall not treat him like an enemy of society: the worst we shall think ourselves justified in doing is leaving him to himself, if we do not interfere benevolently by showing interest or concern for him. It is far otherwise if he has infringed the rules necessary for the protection of his fellow-creatures, individually or collectively. The evil consequences of his acts do not then fall on himself, but on others; and society, as the protector of all its members, must retaliate on him; must inflict pain on him for the express purpose of punishment, and must take care that it be sufficiently severe. In the one case, he is an offender at our bar, and we are called on not only to sit in judgment on him, but, in one shape or another, to execute our own sentence: in the other case, it is not our part to inflict any suffering on him, except what may incidentally follow from our using the same liberty in the regulation of our own affairs, which we allow to him in his.

The distinction here pointed out between the part of a person's life which concerns only himself, and that which concerns others, many persons will refuse to admit. How (it may be asked) can any part of the conduct of a member of society be a matter of indifference to the other members? No person is an entirely isolated being; it is impossible for a person to do anything seriously or permanently hurtful to himself, without mischief reaching at least to his near connections, and often far beyond them. If he injures his property, he does harm to those who directly or indirectly derived support from it, and usually diminishes, by a greater or less amount, the general resources of the community. If he deteriorates his bodily or mental faculties, he not only brings evil upon all who depended on him for any portion of their happiness, but disqualifies himself for rendering the services which he owes to his fellow-creatures generally; perhaps becomes a burthen on their affection or benevolence; and if such conduct were very frequent, hardly any offence that is committed would detract more from the general sum of good. Finally, if by his vices or follies a person does no direct harm to others, he is nevertheless (it may be said) injurious by his example; and ought to be compelled to control himself, for the sake of those whom the sight or knowledge of his conduct might corrupt or mislead.

And even (it will be added) if the consequences of misconduct could be confined to the vicious or thoughtless individual, ought society to abandon to their own guidance those who are manifestly unfit for it? If protection against themselves is confessedly due

to children and persons under age, is not society equally bound to afford it to persons of mature years who are equally incapable of self-government? If gambling, or drunkenness, or incontinence, or idleness, or uncleanliness, are as injurious to happiness, and as great a hindrance to improvement, as many or most of the acts prohibited by law, why (it may be asked) should not law, so far as is consistent with practicability and social convenience, endeavour to repress these also? And as a supplement to the unavoidable imperfections of law, ought not opinion at least to organise a powerful police against these vices, and visit rigidly with social penalties those who are known to practise them? There is no question here (it may be said) about restricting individuality, or impeding the trial of new and original experiments in living. The only things it is sought to prevent are things which have been tried and condemned from the beginning of the world until now; things which experience has shown not to be useful or suitable to any person's individuality. There must be some length of time and amount of experience, after which a moral or prudential truth may be regarded as established: and it is merely desired to prevent generation after generation from falling over the same precipice which has been fatal to their predecessors.

I fully admit that the mischief which a person does to himself, may seriously affect, both through their sympathies and their interests, those nearly connected with him, and in a minor degree, society at large. When, by conduct of this sort, a person is led to violate a distinct and assignable obligation to any other person or persons, the case is taken out of the self-regarding class, and becomes amenable to moral disapprobation in the proper sense of the term. If, for example, a man, through intemperance or extravagance, becomes unable to pay his debts, or, having undertaken the moral responsibility of a family, becomes from the same cause incapable of supporting or educating them, he is deservedly reprobated, and might be justly punished; but it is for the breach of duty to his family or creditors, not for the extravagance. If the resources which ought to have been devoted to them, had been diverted from them for the most prudent investment, the moral culpability would have been the same. George Barnwell murdered his uncle to get money for his mistress, but if he had done it to set himself up in business, he would equally have been hanged. Again, in the frequent case of a man who causes grief to his family by addiction to bad habits, he deserves reproach for his unkindness or ingratitude; but so he may for cultivating habits not in themselves vicious, if they are painful to those with whom he passes his life, or who from personal ties are dependent on him for their comfort. Whoever fails in the consideration generally due to the interests and feelings of others, not being compelled by some more imperative duty, or justified by allowable self-preference, is a subject of moral disapprobation for that failure, but not for the cause of it, nor for the errors, merely personal to himself, which may have remotely led to it. In like manner, when a person disables himself, by conduct purely self-regarding, from the performance of some definite duty incumbent on him to the public, he is guilty of a social offence. No person ought to be punished simply for being drunk; but a soldier or a policeman should be punished for being drunk on duty. Whenever, in short, there is a definite damage, or a definite risk of damage, either to an individual or to the public, the case is taken out of the province of liberty, and placed in that of morality or law.

But with regard to the merely contingent, or, as it may be called, constructive injury which a person causes to society, by conduct which neither violates any specific duty to the public, nor occasions perceptible hurt to any assignable individual except himself; the inconvenience is one which society can afford to bear, for the sake of the greater good of human freedom. If grown persons are to be punished for not taking proper care of themselves, I would rather it were for their own sake, than under pretence of preventing them from impairing their capacity of rendering to society benefits which society does not pretend it has a right to exact. But I cannot consent to argue the point as if society had no means of bringing its weaker members up to its ordinary standard of rational conduct, except waiting till they do something irrational, and then punishing them, legally or morally, for it. Society has had absolute power over them during all the early portion of their existence: it has had the whole period of childhood and nonage in which to try whether it could make them capable of rational conduct in life. The existing generation is master both of the training and the entire circumstances of the generation to come; it cannot indeed make them perfectly wise and good, because it is itself so lamentably deficient in goodness and wisdom; and its best efforts are not always, in individual cases, its most successful ones; but it is perfectly well able to make the rising generation, as a whole, as good as, and a little better than, itself. If society lets any considerable number of its members grow up mere children, incapable of being acted on by rational consideration of distant motives, society has itself to blame for the consequences. Armed not only with all the powers of education, but with the ascendency which the authority of a received opinion always exercises over the minds who are least fitted to judge for themselves; and aided by the _natural_ penalties which cannot be prevented from falling on those who incur the distaste or the contempt of those who know them; let not society pretend that it needs, besides all this, the power to issue commands and enforce obedience in the personal concerns of individuals, in which, on all principles of justice and policy, the decision ought to rest with those who are to abide the consequences. Nor is there anything which tends more to discredit and frustrate the better means of influencing conduct, than a resort to the worse. If there be among those whom it is attempted to coerce into prudence or temperance, any of the material of

which vigorous and independent characters are made, they will infallibly rebel against the yoke. No such person will ever feel that others have a right to control him in his concerns, such as they have to prevent him from injuring them in theirs; and it easily comes to be considered a mark of spirit and courage to fly in the face of such usurped authority, and do with ostentation the exact opposite of what it enjoins; as in the fashion of grossness which succeeded, in the time of Charles II., to the fanatical moral intolerance of the Puritans. With respect to what is said of the necessity of protecting society from the bad example set to others by the vicious or the self-indulgent; it is true that bad example may have a pernicious effect, especially the example of doing wrong to others with impunity to the wrong-doer. But we are now speaking of conduct which, while it does no wrong to others, is supposed to do great harm to the agent himself: and I do not see how those who believe this, can think otherwise than that the example, on the whole, must be more salutary than hurtful, since, if it displays the misconduct, it displays also the painful or degrading consequences which, if the conduct is justly censured, must be supposed to be in all or most cases attendant on it.

But the strongest of all the arguments against the interference of the public with purely personal conduct, is that when it does interfere, the odds are that it interferes wrongly, and in the wrong place. On questions of social morality, of duty to others, the opinion of the public, that is, of an overruling majority, though often wrong, is likely to be still oftener right; because on such questions they are only required to judge of their own interests; of the manner in which some mode of conduct, if allowed to be practised, would affect themselves. But the opinion of a similar majority, imposed as a law on the minority, on questions of self-regarding conduct, is quite as likely to be wrong as right; for in these cases public opinion means, at the best, some people's opinion of what is good or bad for other people; while very often it does not even mean that; the public, with the most perfect indifference, passing over the pleasure or convenience of those whose conduct they censure, and considering only their own preference. There are many who consider as an injury to themselves any conduct which they have a distaste for, and resent it as an outrage to their feelings; as a religious bigot, when charged with disregarding the religious feelings of others, has been known to retort that they disregard his feelings, by persisting in their abominable worship or creed. But there is no parity between the feeling of a person for his own opinion, and the feeling of another who is offended at his holding it; no more than between the desire of a thief to take a purse, and the desire of the right owner to keep it. And a person's taste is as much his own peculiar concern as his opinion or his purse. It is easy for any one to imagine an ideal public, which leaves the freedom and choice of individuals in all uncertain matters undisturbed, and only requires them to abstain from modes of conduct which universal experience has condemned. But where has there been seen a public which set any such limit to its censorship? or when does the public trouble itself about universal experience? In its interferences with personal conduct it is seldom thinking of anything but the enormity of acting or feeling differently from itself; and this standard of judgment, thinly disguised, is held up to mankind as the dictate of religion and philosophy, by nine-tenths of all moralists and speculative writers. These teach that things are right because they are right; because we feel them to be so. They tell us to search in our own minds and hearts for laws of conduct binding on ourselves and on all others. What can the poor public do but apply these instructions, and make their own personal feelings of good and evil, if they are tolerably unanimous in them, obligatory on all the world?

The evil here pointed out is not one which exists only in theory; and it may perhaps be expected that I should specify the instances in which the public of this age and country improperly invests its own preferences with the character of moral laws. I am not writing an essay on the aberrations of existing moral feeling. That is too weighty a subject to be discussed parenthetically, and by way of illustration. Yet examples are necessary, to show that the principle I maintain is of serious and practical moment, and that I am not endeavouring to erect a barrier against imaginary evils. And it is not difficult to show, by abundant instances, that to extend the bounds of what may be called moral police, until it encroaches on the most unquestionably legitimate liberty of the individual, is one of the most universal of all human propensities.

As a first instance, consider the antipathies which men cherish on no better grounds than that persons whose religious opinions are different from theirs, do not practise their religious observances, especially their religious abstinences. To cite a rather trivial example, nothing in the creed or practice of Christians does more to envenom the hatred of Mahomedans against them, than the fact of their eating pork. There are few acts which Christians and Europeans regard with more unaffected disgust, than Mussulmans regard this particular mode of satisfying hunger. It is, in the first place, an offence against their religion; but this circumstance by no means explains either the degree or the kind of their repugnance; for wine also is forbidden by their religion, and to partake of it is by all Mussulmans accounted wrong, but not disgusting. Their aversion to the flesh of the "unclean beast" is, on the contrary, of that peculiar character, resembling an instinctive antipathy, which the idea of uncleanness, when once it thoroughly sinks into the feelings, seems always to excite even in those whose personal habits are anything but scrupulously cleanly, and of which the sentiment of religious impurity, so intense in the Hindoos, is a remarkable example. Suppose now that in a people, of whom the majority were Mussulmans, that majority should insist upon not permitting pork to be eaten within the limits of

the country. This would be nothing new in Mahomedan countries.[14] Would it be a legitimate exercise of the moral authority of public opinion? and if not, why not? The practice is really revolting to such a public. They also sincerely think that it is forbidden and abhorred by the Deity. Neither could the prohibition be censured as religious persecution. It might be religious in its origin, but it would not be persecution for religion, since nobody's religion makes it a duty to eat pork. The only tenable ground of condemnation would be, that with the personal tastes and self-regarding concerns of individuals the public has no business to interfere.

To come somewhat nearer home: the majority of Spaniards consider it a gross impiety, offensive in the highest degree to the Supreme Being, to worship him in any other manner than the Roman Catholic; and no other public worship is lawful on Spanish soil. The people of all Southern Europe look upon a married clergy as not only irreligious, but unchaste, indecent, gross, disgusting. What do Protestants think of these perfectly sincere feelings, and of the attempt to enforce them against non-Catholics? Yet, if mankind are justified in interfering with each other's liberty in things which do not concern the interests of others, on what principle is it possible consistently to exclude these cases? or who can blame people for desiring to suppress what they regard as a scandal in the sight of God and man? No stronger case can be shown for prohibiting anything which is regarded as a personal immorality, than is made out for suppressing these practices in the eyes of those who regard them as impieties; and unless we are willing to adopt the logic of persecutors, and to say that we may persecute others because we are right, and that they must not persecute us because they are wrong, we must beware of admitting a principle of which we should resent as a gross injustice the application to ourselves.

The preceding instances may be objected to, although unreasonably, as drawn from contingencies impossible among us: opinion, in this country, not being likely to enforce abstinence from meats, or to interfere with people for worshipping, and for either marrying or not marrying, according to their creed or inclination. The next example, however, shall be taken from an interference with liberty which we have by no means passed all danger of. Wherever the Puritans have been sufficiently powerful, as in New England, and in Great Britain at the time of the Commonwealth, they have endeavoured, with considerable success, to put down all public, and nearly all private, amusements: especially music, dancing, public games, or other assemblages for purposes of diversion, and the theatre. There are still in this country large bodies of persons by whose notions of morality and religion these recreations are condemned; and those persons belonging chiefly to the middle class, who are the ascendant power in the present social and political condition of the kingdom, it is by no means impossible that persons of these sentiments may at some time or other command a majority in Parliament. How will the remaining portion of the community like to have the amusements that shall be permitted to them regulated by the religious and moral sentiments of the stricter Calvinists and Methodists? Would they not, with considerable peremptoriness, desire these intrusively pious members of society to mind their own business? This is precisely what should be said to every government and every public, who have the pretension that no person shall enjoy any pleasure which they think wrong. But if the principle of the pretension be admitted, no one can reasonably object to its being acted on in the sense of the majority, or other preponderating power in the country; and all persons must be ready to conform to the idea of a Christian commonwealth, as understood by the early settlers in New England, if a religious profession similar to theirs should ever succeed in regaining its lost ground, as religions supposed to be declining have so often been known to do.

To imagine another contingency, perhaps more likely to be realised than the one last mentioned. There is confessedly a strong tendency in the modern world towards a democratic constitution of society, accompanied or not by popular political institutions. It is affirmed that in the country where this tendency is most completely realised--where both society and the government are most democratic--the United States--the feeling of the majority, to whom any appearance of a more showy or costly style of living than they can hope to rival is disagreeable, operates as a tolerably effectual sumptuary law, and that in many parts of the Union it is really difficult for a person possessing a very large income, to find any mode of spending it, which will not incur popular disapprobation. Though such statements as these are doubtless much exaggerated as a representation of existing facts, the state of things they describe is not only a conceivable and possible, but a probable result of democratic feeling, combined with the notion that the public has a right to a veto on the manner in which individuals shall spend their incomes. We have only further to suppose a considerable diffusion of Socialist opinions, and it may become infamous in the eyes of the majority to possess more property than some very small amount, or any income not earned by manual labour. Opinions similar in principle to these, already prevail widely among the artisan class, and weigh oppressively on those who are amenable to the opinion chiefly of that class, namely, its own members. It is known that the bad workmen who form the majority of the operatives in many branches of industry, are decidedly of opinion that bad workmen ought to receive the same wages as good, and that no one ought to be allowed, through piecework or otherwise, to earn by superior skill or industry more than others can without it. And they employ a moral police, which occasionally becomes a physical one, to deter skilful workmen from receiving, and employers from giving, a larger remuneration for a more useful service. If the public have any jurisdiction over private concerns, I cannot see that these people are in fault, or that any

individual's particular public can be blamed for asserting the same authority over his individual conduct, which the general public asserts over people in general.

But, without dwelling upon supposititious cases, there are, in our own day, gross usurpations upon the liberty of private life actually practised, and still greater ones threatened with some expectation of success, and opinions proposed which assert an unlimited right in the public not only to prohibit by law everything which it thinks wrong, but in order to get at what it thinks wrong, to prohibit any number of things which it admits to be innocent.

Under the name of preventing intemperance, the people of one English colony, and of nearly half the United States, have been interdicted by law from making any use whatever of fermented drinks, except for medical purposes: for prohibition of their sale is in fact, as it is intended to be, prohibition of their use. And though the impracticability of executing the law has caused its repeal in several of the States which had adopted it, including the one from which it derives its name, an attempt has notwithstanding been commenced, and is prosecuted with considerable zeal by many of the professed philanthropists, to agitate for a similar law in this country. The association, or "Alliance" as it terms itself, which has been formed for this purpose, has acquired some notoriety through the publicity given to a correspondence between its Secretary and one of the very few English public men who hold that a politician's opinions ought to be founded on principles. Lord Stanley's share in this correspondence is calculated to strengthen the hopes already built on him, by those who know how rare such qualities as are manifested in some of his public appearances, unhappily are among those who figure in political life. The organ of the Alliance, who would "deeply deplore the recognition of any principle which could be wrested to justify bigotry and persecution," undertakes to point out the "broad and impassable barrier" which divides such principles from those of the association. "All matters relating to thought, opinion, conscience, appear to me," he says, "to be without the sphere of legislation; all pertaining to social act, habit, relation, subject only to a discretionary power vested in the State itself, and not in the individual, to be within it." No mention is made of a third class, different from either of these, viz. acts and habits which are not social, but individual; although it is to this class, surely, that the act of drinking fermented liquors belongs. Selling fermented liquors, however, is trading, and trading is a social act. But the infringement complained of is not on the liberty of the seller, but on that of the buyer and consumer; since the State might just as well forbid him to drink wine, as purposely make it impossible for him to obtain it. The Secretary, however, says, "I claim, as a citizen, a right to legislate whenever my social rights are invaded by the social act of another." And now for the definition of these "social rights." "If anything invades my social rights, certainly the traffic in strong drink does. It destroys my primary right of security, by constantly creating and stimulating social disorder. It invades my right of equality, by deriving a profit from the creation of a misery, I am taxed to support. It impedes my right to free moral and intellectual development, by surrounding my path with dangers, and by weakening and demoralising society, from which I have a right to claim mutual aid and intercourse." A theory of "social rights," the like of which probably never before found its way into distinct language--being nothing short of this--that it is the absolute social right of every individual, that every other individual shall act in every respect exactly as he ought; that whosoever fails thereof in the smallest particular, violates my social right, and entitles me to demand from the legislature the removal of the grievance. So monstrous a principle is far more dangerous than any single interference with liberty; there is no violation of liberty which it would not justify; it acknowledges no right to any freedom whatever, except perhaps to that of holding opinions in secret, without ever disclosing them: for the moment an opinion which I consider noxious, passes any one's lips, it invades all the "social rights" attributed to me by the Alliance. The doctrine ascribes to all mankind a vested interest in each other's moral, intellectual, and even physical perfection, to be defined by each claimant according to his own standard.

Another important example of illegitimate interference with the rightful liberty of the individual, not simply threatened, but long since carried into triumphant effect, is Sabbatarian legislation. Without doubt, abstinence on one day in the week, so far as the exigencies of life permit, from the usual daily occupation, though in no respect religiously binding on any except Jews, is a highly beneficial custom. And inasmuch as this custom cannot be observed without a general consent to that effect among the industrious classes, therefore, in so far as some persons by working may impose the same necessity on others, it may be allowable and right that the law should guarantee to each, the observance by others of the custom, by suspending the greater operations of industry on a particular day. But this justification, grounded on the direct interest which others have in each individual's observance of the practice, does not apply to the self-chosen occupations in which a person may think fit to employ his leisure; nor does it hold good, in the smallest degree, for legal restrictions on amusements. It is true that the amusement of some is the day's work of others; but the pleasure, not to say the useful recreation, of many, is worth the labour of a few, provided the occupation is freely chosen, and can be freely resigned. The operatives are perfectly right in thinking that if all worked on Sunday, seven days' work would have to be given for six days' wages: but so long as the great mass of employments are suspended, the small number who for the enjoyment of others must still work, obtain a proportional increase of earnings; and they are not obliged to follow those occupations,

if they prefer leisure to emolument. If a further remedy is sought, it might be found in the establishment by custom of a holiday on some other day of the week for those particular classes of persons. The only ground, therefore, on which restrictions on Sunday amusements can be defended, must be that they are religiously wrong; a motive of legislation which never can be too earnestly protested against. "Deorum injuriae Diis curae." It remains to be proved that society or any of its officers holds a commission from on high to avenge any supposed offence to Omnipotence, which is not also a wrong to our fellow-creatures. The notion that it is one man's duty that another should be religious, was the foundation of all the religious persecutions ever perpetrated, and if admitted, would fully justify them. Though the feeling which breaks out in the repeated attempts to stop railway travelling on Sunday, in the resistance to the opening of Museums, and the like, has not the cruelty of the old persecutors, the state of mind indicated by it is fundamentally the same. It is a determination not to tolerate others in doing what is permitted by their religion, because it is not permitted by the persecutor's religion. It is a belief that God not only abominates the act of the misbeliever, but will not hold us guiltless if we leave him unmolested.

I cannot refrain from adding to these examples of the little account commonly made of human liberty, the language of downright persecution which breaks out from the press of this country, whenever it feels called on to notice the remarkable phenomenon of Mormonism. Much might be said on the unexpected and instructive fact, that an alleged new revelation, and a religion founded on it, the product of palpable imposture, not even supported by the _prestige_ of extraordinary qualities in its founder, is believed by hundreds of thousands, and has been made the foundation of a society, in the age of newspapers, railways, and the electric telegraph. What here concerns us is, that this religion, like other and better religions, has its martyrs; that its prophet and founder was, for his teaching, put to death by a mob; that others of its adherents lost their lives by the same lawless violence; that they were forcibly expelled, in a body, from the country in which they first grew up; while, now that they have been chased into a solitary recess in the midst of a desert, many in this country openly declare that it would be right (only that it is not convenient) to send an expedition against them, and compel them by force to conform to the opinions of other people. The article of the Mormonite doctrine which is the chief provocative to the antipathy which thus breaks through the ordinary restraints of religious tolerance, is its sanction of polygamy; which, though permitted to Mahomedans, and Hindoos, and Chinese, seems to excite unquenchable animosity when practised by persons who speak English, and profess to be a kind of Christians. No one has a deeper disapprobation than I have of this Mormon institution; both for other reasons, and because, far from being in any way countenanced by the principle of liberty, it is a direct infraction of that principle, being a mere riveting of the chains of one half of the community, and an emancipation of the other from reciprocity of obligation towards them. Still, it must be remembered that this relation is as much voluntary on the part of the women concerned in it, and who may be deemed the sufferers by it, as is the case with any other form of the marriage institution; and however surprising this fact may appear, it has its explanation in the common ideas and customs of the world, which teaching women to think marriage the one thing needful, make it intelligible that many a woman should prefer being one of several wives, to not being a wife at all. Other countries are not asked to recognise such unions, or release any portion of their inhabitants from their own laws on the score of Mormonite opinions. But when the dissentients have conceded to the hostile sentiments of others, far more than could justly be demanded; when they have left the countries to which their doctrines were unacceptable, and established themselves in a remote corner of the earth, which they have been the first to render habitable to human beings; it is difficult to see on what principles but those of tyranny they can be prevented from living there under what laws they please, provided they commit no aggression on other nations, and allow perfect freedom of departure to those who are dissatisfied with their ways. A recent writer, in some respects of considerable merit, proposes (to use his own words), not a crusade, but a _civilizade_, against this polygamous community, to put an end to what seems to him a retrograde step in civilisation. It also appears so to me, but I am not aware that any community has a right to force another to be civilised. So long as the sufferers by the bad law do not invoke assistance from other communities, I cannot admit that persons entirely unconnected with them ought to step in and require that a condition of things with which all who are directly interested appear to be satisfied, should be put an end to because it is a scandal to persons some thousands of miles distant, who have no part or concern in it. Let them send missionaries, if they please, to preach against it; and let them, by any fair means (of which silencing the teachers is not one), oppose the progress of similar doctrines among their own people. If civilisation has got the better of barbarism when barbarism had the world to itself, it is too much to profess to be afraid lest barbarism, after having been fairly got under, should revive and conquer civilisation. A civilisation that can thus succumb to its vanquished enemy, must first have become so degenerate, that neither its appointed priests and teachers, nor anybody else, has the capacity, or will take the trouble, to stand up for it. If this be so, the sooner such a civilisation receives notice to quit, the better. It can only go on from bad to worse, until destroyed and regenerated (like the Western Empire) by energetic barbarians.

FOOTNOTE:

[14] The case of the Bombay Parsees is a curious instance in point. When this industrious and enterprising tribe, the descendants of the Persian fire-worshippers, flying from their native country before the Caliphs, arrived in Western India, they were admitted to toleration by the Hindoo sovereigns, on condition of not eating beef. When those regions afterwards fell under the dominion of Mahomedan conquerors, the Parsees obtained from them a continuance of indulgence, on condition of refraining from pork. What was at first obedience to authority became a second nature, and the Parsees to this day abstain both from beef and pork. Though not required by their religion, the double abstinence has had time to grow into a custom of their tribe; and custom, in the East, is a religion.

CHAPTER V.

APPLICATIONS.

The principles asserted in these pages must be more generally admitted as the basis for discussion of details, before a consistent application of them to all the various departments of government and morals can be attempted with any prospect of advantage. The few observations I propose to make on questions of detail, are designed to illustrate the principles, rather than to follow them out to their consequences. I offer, not so much applications, as specimens of application; which may serve to bring into greater clearness the meaning and limits of the two maxims which together form the entire doctrine of this Essay, and to assist the judgment in holding the balance between them, in the cases where it appears doubtful which of them is applicable to the case.

The maxims are, first, that the individual is not accountable to society for his actions, in so far as these concern the interests of no person but himself. Advice, instruction, persuasion, and avoidance by other people if thought necessary by them for their own good, are the only measures by which society can justifiably express its dislike or disapprobation of his conduct. Secondly, that for such actions as are prejudicial to the interests of others, the individual is accountable and may be subjected either to social or to legal punishments, if society is of opinion that the one or the other is requisite for its protection.

In the first place, it must by no means be supposed, because damage, or probability of damage, to the interests of others, can alone justify the interference of society, that therefore it always does justify such interference. In many cases, an individual, in pursuing a legitimate object, necessarily and therefore legitimately causes pain or loss to others, or intercepts a good which they had a reasonable hope of obtaining. Such oppositions of interest between individuals often arise from bad social institutions, but are unavoidable while those institutions last; and some would be unavoidable under any institutions. Whoever succeeds in an overcrowded profession, or in a competitive examination; whoever is preferred to another in any contest for an object which both desire, reaps benefit from the loss of others, from their wasted exertion and their disappointment. But it is, by common admission, better for the general interest of mankind, that persons should pursue their objects undeterred by this sort of consequences. In other words, society admits no rights, either legal or moral, in the disappointed competitors, to immunity from this kind of suffering; and feels called on to interfere, only when means of success have been employed which it is contrary to the general interest to permit--namely, fraud or treachery, and force.

Again, trade is a social act. Whoever undertakes to sell any description of goods to the public, does what affects the interest of other persons, and of society in general; and thus his conduct, in principle, comes within the jurisdiction of society: accordingly, it was once held to be the duty of governments, in all cases which were considered of importance, to fix prices, and regulate the processes of manufacture. But it is now recognised, though not till after a long struggle, that both the cheapness and the good quality of commodities are most effectually provided for by leaving the producers and sellers perfectly free, under the sole check of equal freedom to the buyers for supplying themselves elsewhere. This is the so-called doctrine of Free Trade, which rests on grounds different from, though equally solid with, the principle of individual liberty asserted in this Essay. Restrictions on trade, or on production for purposes of trade, are indeed restraints; and all restraint, _qua_ restraint, is an evil: but the restraints in question affect only that part of conduct which society is competent to restrain, and are wrong solely because they do not really produce the results which it is desired to produce by them. As the principle of individual liberty is not involved in the doctrine of Free Trade, so neither is it in most of the questions which arise respecting the limits of that doctrine: as for example, what amount of public control is admissible for the prevention of fraud by adulteration; how far sanitary precautions, or arrangements to protect work-people employed in dangerous occupations, should be enforced on employers. Such questions involve considerations of liberty, only in so far as leaving people to themselves is always better, _caeteris paribus_, than controlling them: but that they may be legitimately controlled for these ends, is in principle undeniable. On the other hand, there are questions relating to interference with trade, which are essentially questions of liberty; such as the Maine Law, already touched upon; the prohibition of the importation of opium into

China; the restriction of the sale of poisons; all cases, in short, where the object of the interference is to make it impossible or difficult to obtain a particular commodity. These interferences are objectionable, not as infringements on the liberty of the producer or seller, but on that of the buyer.

One of these examples, that of the sale of poisons, opens a new question; the proper limits of what may be called the functions of police; how far liberty may legitimately be invaded for the prevention of crime, or of accident. It is one of the undisputed functions of government to take precautions against crime before it has been committed, as well as to detect and punish it afterwards. The preventive function of government, however, is far more liable to be abused, to the prejudice of liberty, than the punitory function; for there is hardly any part of the legitimate freedom of action of a human being which would not admit of being represented, and fairly too, as increasing the facilities for some form or other of delinquency. Nevertheless, if a public authority, or even a private person, sees any one evidently preparing to commit a crime, they are not bound to look on inactive until the crime is committed, but may interfere to prevent it. If poisons were never bought or used for any purpose except the commission of murder, it would be right to prohibit their manufacture and sale. They may, however, be wanted not only for innocent but for useful purposes, and restrictions cannot be imposed in the one case without operating in the other. Again, it is a proper office of public authority to guard against accidents. If either a public officer or any one else saw a person attempting to cross a bridge which had been ascertained to be unsafe, and there were no time to warn him of his danger, they might seize him and turn him back, without any real infringement of his liberty; for liberty consists in doing what one desires, and he does not desire to fall into the river. Nevertheless, when there is not a certainty, but only a danger of mischief, no one but the person himself can judge of the sufficiency of the motive which may prompt him to incur the risk: in this case, therefore (unless he is a child, or delirious, or in some state of excitement or absorption incompatible with the full use of the reflecting faculty), he ought, I conceive, to be only warned of the danger; not forcibly prevented from exposing himself to it. Similar considerations, applied to such a question as the sale of poisons, may enable us to decide which among the possible modes of regulation are or are not contrary to principle. Such a precaution, for example, as that of labelling the drug with some word expressive of its dangerous character, may be enforced without violation of liberty: the buyer cannot wish not to know that the thing he possesses has poisonous qualities. But to require in all cases the certificate of a medical practitioner, would make it sometimes impossible, always expensive, to obtain the article for legitimate uses. The only mode apparent to me, in which difficulties may be thrown in the way of crime committed through this means, without any infringement, worth taking into account, upon the liberty of those who desire the poisonous substance for other purposes, consists in providing what, in the apt language of Bentham, is called "preappointed evidence." This provision is familiar to every one in the case of contracts. It is usual and right that the law, when a contract is entered into, should require as the condition of its enforcing performance, that certain formalities should be observed, such as signatures, attestation of witnesses, and the like, in order that in case of subsequent dispute, there may be evidence to prove that the contract was really entered into, and that there was nothing in the circumstances to render it legally invalid: the effect being, to throw great obstacles in the way of fictitious contracts, or contracts made in circumstances which, if known, would destroy their validity. Precautions of a similar nature might be enforced in the sale of articles adapted to be instruments of crime. The seller, for example, might be required to enter into a register the exact time of the transaction, the name and address of the buyer, the precise quality and quantity sold; to ask the purpose for which it was wanted, and record the answer he received. When there was no medical prescription, the presence of some third person might be required, to bring home the fact to the purchaser, in case there should afterwards be reason to believe that the article had been applied to criminal purposes. Such regulations would in general be no material impediment to obtaining the article, but a very considerable one to making an improper use of it without detection.

The right inherent in society, to ward off crimes against itself by antecedent precautions, suggests the obvious limitations to the maxim, that purely self-regarding misconduct cannot properly be meddled with in the way of prevention or punishment. Drunkenness, for example, in ordinary cases, is not a fit subject for legislative interference; but I should deem it perfectly legitimate that a person, who had once been convicted of any act of violence to others under the influence of drink, should be placed under a special legal restriction, personal to himself; that if he were afterwards found drunk, he should be liable to a penalty, and that if when in that state he committed another offence, the punishment to which he would be liable for that other offence should be increased in severity. The making himself drunk, in a person whom drunkenness excites to do harm to others, is a crime against others. So, again, idleness, except in a person receiving support from the public, or except when it constitutes a breach of contract, cannot without tyranny be made a subject of legal punishment; but if either from idleness or from any other avoidable cause, a man fails to perform his legal duties to others, as for instance to support his children, it is no tyranny to force him to fulfil that obligation, by compulsory labour, if no other means are available.

Again, there are many acts which, being directly injurious only to the agents themselves, ought not to be legally interdicted, but which, if done publicly, are a violation of good manners and coming thus within the category of offences against others may rightfully be prohibited. Of this kind are offences against decency; on which it is unnecessary to dwell, the rather as they are only connected indirectly with our subject, the objection to publicity being equally strong in the case of many actions not in themselves condemnable, nor supposed to be so.

There is another question to which an answer must be found, consistent with the principles which have been laid down. In cases of personal conduct supposed to be blamable, but which respect for liberty precludes society from preventing or punishing, because the evil directly resulting falls wholly on the agent; what the agent is free to do, ought other persons to be equally free to counsel or instigate? This question is not free from difficulty. The case of a person who solicits another to do an act, is not strictly a case of self-regarding conduct. To give advice or offer inducements to any one, is a social act, and may therefore, like actions in general which affect others, be supposed amenable to social control. But a little reflection corrects the first impression, by showing that if the case is not strictly within the definition of individual liberty, yet the reasons on which the principle of individual liberty is grounded, are applicable to it. If people must be allowed, in whatever concerns only themselves, to act as seems best to themselves at their own peril, they must equally be free to consult with one another about what is fit to be so done; to exchange opinions, and give and receive suggestions. Whatever it is permitted to do, it must be permitted to advise to do. The question is doubtful, only when the instigator derives a personal benefit from his advice; when he makes it his occupation, for subsistence or pecuniary gain, to promote what society and the state consider to be an evil. Then, indeed, a new element of complication is introduced; namely, the existence of classes of persons with an interest opposed to what is considered as the public weal, and whose mode of living is grounded on the counteraction of it. Ought this to be interfered with, or not? Fornication, for example, must be tolerated, and so must gambling; but should a person be free to be a pimp, or to keep a gambling-house? The case is one of those which lie on the exact boundary line between two principles, and it is not at once apparent to which of the two it properly belongs. There are arguments on both sides. On the side of toleration it may be said, that the fact of following anything as an occupation, and living or profiting by the practice of it, cannot make that criminal which would otherwise be admissible; that the act should either be consistently permitted or consistently prohibited; that if the principles which we have hitherto defended are true, society has no business, _as_ society, to decide anything to be wrong which concerns only the individual; that it cannot go beyond dissuasion, and that one person should be as free to persuade, as another to dissuade. In opposition to this it may be contended, that although the public, or the State, are not warranted in authoritatively deciding, for purposes of repression or punishment, that such or such conduct affecting only the interests of the individual is good or bad, they are fully justified in assuming, if they regard it as bad, that its being so or not is at least a disputable question: That, this being supposed, they cannot be acting wrongly in endeavouring to exclude the influence of solicitations which are not disinterested, of instigators who cannot possibly be impartial--who have a direct personal interest on one side, and that side the one which the State believes to be wrong, and who confessedly promote it for personal objects only. There can surely, it may be urged, be nothing lost, no sacrifice of good, by so ordering matters that persons shall make their election, either wisely or foolishly, on their own prompting, as free as possible from the arts of persons who stimulate their inclinations for interested purposes of their own. Thus (it may be said) though the statutes respecting unlawful games are utterly indefensible--though all persons should be free to gamble in their own or each other's houses, or in any place of meeting established by their own subscriptions, and open only to the members and their visitors--yet public gambling-houses should not be permitted. It is true that the prohibition is never effectual, and that whatever amount of tyrannical power is given to the police, gambling-houses can always be maintained under other pretences; but they may be compelled to conduct their operations with a certain degree of secrecy and mystery, so that nobody knows anything about them but those who seek them; and more than this, society ought not to aim at. There is considerable force in these arguments; I will not venture to decide whether they are sufficient to justify the moral anomaly of punishing the accessary, when the principal is (and must be) allowed to go free; or fining or imprisoning the procurer, but not the fornicator, the gambling-house keeper, but not the gambler. Still less ought the common operations of buying and selling to be interfered with on analogous grounds. Almost every article which is bought and sold may be used in excess, and the sellers have a pecuniary interest in encouraging that excess; but no argument can be founded on this, in favour, for instance, of the Maine Law; because the class of dealers in strong drinks, though interested in their abuse, are indispensably required for the sake of their legitimate use. The interest, however, of these dealers in promoting intemperance is a real evil, and justifies the State in imposing restrictions and requiring guarantees, which but for that justification would be infringements of legitimate liberty.

A further question is, whether the State, while it permits, should nevertheless indirectly discourage conduct which it deems contrary to the best interests of the agent; whether, for example, it should take measures to render the means of drunkenness more costly,

or add to the difficulty of procuring them, by limiting the number of the places of sale. On this as on most other practical questions, many distinctions require to be made. To tax stimulants for the sole purpose of making them more difficult to be obtained, is a measure differing only in degree from their entire prohibition; and would be justifiable only if that were justifiable. Every increase of cost is a prohibition, to those whose means do not come up to the augmented price; and to those who do, it is a penalty laid on them for gratifying a particular taste. Their choice of pleasures, and their mode of expending their income, after satisfying their legal and moral obligations to the State and to individuals, are their own concern, and must rest with their own judgment. These considerations may seem at first sight to condemn the selection of stimulants as special subjects of taxation for purposes of revenue. But it must be remembered that taxation for fiscal purposes is absolutely inevitable; that in most countries it is necessary that a considerable part of that taxation should be indirect; that the State, therefore, cannot help imposing penalties, which to some persons may be prohibitory, on the use of some articles of consumption. It is hence the duty of the State to consider, in the imposition of taxes, what commodities the consumers can best spare; and _a fortiori_, to select in preference those of which it deems the use, beyond a very moderate quantity, to be positively injurious. Taxation, therefore, of stimulants, up to the point which produces the largest amount of revenue (supposing that the State needs all the revenue which it yields) is not only admissible, but to be approved of.

The question of making the sale of these commodities a more or less exclusive privilege, must be answered differently, according to the purposes to which the restriction is intended to be subservient. All places of public resort require the restraint of a police, and places of this kind peculiarly, because offences against society are especially apt to originate there. It is, therefore, fit to confine the power of selling these commodities (at least for consumption on the spot) to persons of known or vouched-for respectability of conduct; to make such regulations respecting hours of opening and closing as may be requisite for public surveillance, and to withdraw the licence if breaches of the peace repeatedly take place through the connivance or incapacity of the keeper of the house, or if it becomes a rendezvous for concocting and preparing offences against the law. Any further restriction I do not conceive to be, in principle, justifiable. The limitation in number, for instance, of beer and spirit-houses, for the express purpose of rendering them more difficult of access, and diminishing the occasions of temptation, not only exposes all to an inconvenience because there are some by whom the facility would be abused, but is suited only to a state of society in which the labouring classes are avowedly treated as children or savages, and placed under an education of restraint, to fit them for future admission to the privileges of freedom. This is not the principle on which the labouring classes are professedly governed in any free country; and no person who sets due value on freedom will give his adhesion to their being so governed, unless after all efforts have been exhausted to educate them for freedom and govern them as freemen, and it has been definitively proved that they can only be governed as children. The bare statement of the alternative shows the absurdity of supposing that such efforts have been made in any case which needs be considered here. It is only because the institutions of this country are a mass of inconsistencies, that things find admittance into our practice which belong to the system of despotic, or what is called paternal, government, while the general freedom of our institutions precludes the exercise of the amount of control necessary to render the restraint of any real efficacy as a moral education.

It was pointed out in an early part of this Essay, that the liberty of the individual, in things wherein the individual is alone concerned, implies a corresponding liberty in any number of individuals to regulate by mutual agreement such things as regard them jointly, and regard no persons but themselves. This question presents no difficulty, so long as the will of all the persons implicated remains unaltered; but since that will may change, it is often necessary, even in things in which they alone are concerned, that they should enter into engagements with one another; and when they do, it is fit, as a general rule, that those engagements should be kept. Yet in the laws, probably, of every country, this general rule has some exceptions. Not only persons are not held to engagements which violate the rights of third parties, but it is sometimes considered a sufficient reason for releasing them from an engagement, that it is injurious to themselves. In this and most other civilised countries, for example, an engagement by which a person should sell himself, or allow himself to be sold, as a slave, would be null and void; neither enforced by law nor by opinion. The ground for thus limiting his power of voluntarily disposing of his own lot in life, is apparent, and is very clearly seen in this extreme case. The reason for not interfering, unless for the sake of others, with a person's voluntary acts, is consideration for his liberty. His voluntary choice is evidence that what he so chooses is desirable, or at the least endurable, to him, and his good is on the whole best provided for by allowing him to take his own means of pursuing it. But by selling himself for a slave, he abdicates his liberty; he foregoes any future use of it, beyond that single act. He therefore defeats, in his own case, the very purpose which is the justification of allowing him to dispose of himself. He is no longer free; but is thenceforth in a position which has no longer the presumption in its favour, that would be afforded by his voluntarily remaining in it. The principle of freedom cannot require that he should be free not to be free. It is not freedom, to be allowed to alienate his freedom. These reasons, the force of which is so conspicuous in this peculiar

case, are evidently of far wider application; yet a limit is everywhere set to them by the necessities of life, which continually require, not indeed that we should resign our freedom, but that we should consent to this and the other limitation of it. The principle, however, which demands uncontrolled freedom of action in all that concerns only the agents themselves, requires that those who have become bound to one another, in things which concern no third party, should be able to release one another from the engagement: and even without such voluntary release, there are perhaps no contracts or engagements, except those that relate to money or money's worth, of which one can venture to say that there ought to be no liberty whatever of retractation. Baron Wilhelm von Humboldt, in the excellent essay from which I have already quoted, states it as his conviction, that engagements which involve personal relations or services, should never be legally binding beyond a limited duration of time; and that the most important of these engagements, marriage, having the peculiarity that its objects are frustrated unless the feelings of both the parties are in harmony with it, should require nothing more than the declared will of either party to dissolve it. This subject is too important, and too complicated, to be discussed in a parenthesis, and I touch on it only so far as is necessary for purposes of illustration. If the conciseness and generality of Baron Humboldt's dissertation had not obliged him in this instance to content himself with enunciating his conclusion without discussing the premises, he would doubtless have recognised that the question cannot be decided on grounds so simple as those to which he confines himself. When a person, either by express promise or by conduct, has encouraged another to rely upon his continuing to act in a certain way--to build expectations and calculations, and stake any part of his plan of life upon that supposition, a new series of moral obligations arises on his part towards that person, which may possibly be overruled, but cannot be ignored. And again, if the relation between two contracting parties has been followed by consequences to others; if it has placed third parties in any peculiar position, or, as in the case of marriage, has even called third parties into existence, obligations arise on the part of both the contracting parties towards those third persons, the fulfilment of which, or at all events the mode of fulfilment, must be greatly affected by the continuance or disruption of the relation between the original parties to the contract. It does not follow, nor can I admit, that these obligations extend to requiring the fulfilment of the contract at all costs to the happiness of the reluctant party; but they are a necessary element in the question; and even if, as Von Humboldt maintains, they ought to make no difference in the _legal_ freedom of the parties to release themselves from the engagement (and I also hold that they ought not to make _much_ difference), they necessarily make a great difference in the _moral_ freedom. A person is bound to take all these circumstances into account, before resolving on a step which may affect such important interests of others; and if he does not allow proper weight to those interests, he is morally responsible for the wrong. I have made these obvious remarks for the better illustration of the general principle of liberty, and not because they are at all needed on the particular question, which, on the contrary, is usually discussed as if the interest of children was everything, and that of grown persons nothing.

I have already observed that, owing to the absence of any recognised general principles, liberty is often granted where it should be withheld, as well as withheld where it should be granted; and one of the cases in which, in the modern European world, the sentiment of liberty is the strongest, is a case where, in my view, it is altogether misplaced. A person should be free to do as he likes in his own concerns; but he ought not to be free to do as he likes in acting for another, under the pretext that the affairs of another are his own affairs. The State, while it respects the liberty of each in what specially regards himself, is bound to maintain a vigilant control over his exercise of any power which it allows him to possess over others. This obligation is almost entirely disregarded in the case of the family relations, a case, in its direct influence on human happiness, more important than all others taken together. The almost despotic power of husbands over wives need not be enlarged upon here because nothing more is needed for the complete removal of the evil, than that wives should have the same rights, and should receive the protection of law in the same manner, as all other persons; and because, on this subject, the defenders of established injustice do not avail themselves of the plea of liberty, but stand forth openly as the champions of power. It is in the case of children, that misapplied notions of liberty are a real obstacle to the fulfilment by the State of its duties. One would almost think that a man's children were supposed to be literally, and not metaphorically, a part of himself, so jealous is opinion of the smallest interference of law with his absolute and exclusive control over them; more jealous than of almost any interference with his own freedom of action: so much less do the generality of mankind value liberty than power. Consider, for example, the case of education. Is it not almost a self-evident axiom, that the State should require and compel the education, up to a certain standard, of every human being who is born its citizen? Yet who is there that is not afraid to recognise and assert this truth? Hardly any one indeed will deny that it is one of the most sacred duties of the parents (or, as law and usage now stand, the father), after summoning a human being into the world, to give to that being an education fitting him to perform his part well in life towards others and towards himself. But while this is unanimously declared to be the father's duty, scarcely anybody, in this country, will bear to hear of obliging him to perform it. Instead of his being required to make any exertion or sacrifice for securing education to the child, it is left to his choice to accept it or not when it is provided gratis! It still remains unrecognised, that to bring a child into existence without a fair prospect of being

able, not only to provide food for its body, but instruction and training for its mind, is a moral crime, both against the unfortunate offspring and against society; and that if the parent does not fulfil this obligation, the State ought to see it fulfilled, at the charge, as far as possible, of the parent.

Were the duty of enforcing universal education once admitted, there would be an end to the difficulties about what the State should teach, and how it should teach, which now convert the subject into a mere battle-field for sects and parties, causing the time and labour which should have been spent in educating, to be wasted in quarrelling about education. If the government would make up its mind to _require_ for every child a good education, it might save itself the trouble of _providing_ one. It might leave to parents to obtain the education where and how they pleased, and content itself with helping to pay the school fees of the poorer class of children, and defraying the entire school expenses of those who have no one else to pay for them. The objections which are urged with reason against State education, do not apply to the enforcement of education by the State, but to the State's taking upon itself to direct that education; which is a totally different thing. That the whole or any large part of the education of the people should be in State hands, I go as far as any one in deprecating. All that has been said of the importance of individuality of character, and diversity in opinions and modes of conduct, involves, as of the same unspeakable importance, diversity of education. A general State education is a mere contrivance for moulding people to be exactly like one another; and as the mould in which it casts them is that which pleases the predominant power in the government, whether this be a monarch, a priesthood, an aristocracy, or the majority of the existing generation, in proportion as it is efficient and successful, it establishes a despotism over the mind, leading by natural tendency to one over the body. An education established and controlled by the State, should only exist, if it exist at all, as one among many competing experiments, carried on for the purpose of example and stimulus, to keep the others up to a certain standard of excellence. Unless, indeed, when society in general is in so backward a state that it could not or would not provide for itself any proper institutions of education, unless the government undertook the task; then, indeed, the government may, as the less of two great evils, take upon itself the business of schools and universities, as it may that of joint stock companies, when private enterprise, in a shape fitted for undertaking great works of industry, does not exist in the country. But in general, if the country contains a sufficient number of persons qualified to provide education under government auspices, the same persons would be able and willing to give an equally good education on the voluntary principle, under the assurance of remuneration afforded by a law rendering education compulsory, combined with State aid to those unable to defray the expense.

The instrument for enforcing the law could be no other than public examinations, extending to all children, and beginning at an early age. An age might be fixed at which every child must be examined, to ascertain if he (or she) is able to read. If a child proves unable, the father, unless he has some sufficient ground of excuse, might be subjected to a moderate fine, to be worked out, if necessary, by his labour, and the child might be put to school at his expense. Once in every year the examination should be renewed, with a gradually extending range of subjects, so as to make the universal acquisition, and what is more, retention, of a certain minimum of general knowledge, virtually compulsory. Beyond that minimum, there should be voluntary examinations on all subjects, at which all who come up to a certain standard of proficiency might claim a certificate. To prevent the State from exercising, through these arrangements, an improper influence over opinion, the knowledge required for passing an examination (beyond the merely instrumental parts of knowledge, such as languages and their use) should, even in the higher class of examinations, be confined to facts and positive science exclusively. The examinations on religion, politics, or other disputed topics, should not turn on the truth or falsehood of opinions, but on the matter of fact that such and such an opinion is held, on such grounds, by such authors, or schools, or churches. Under this system, the rising generation would be no worse off in regard to all disputed truths, than they are at present; they would be brought up either churchmen or dissenters as they now are, the state merely taking care that they should be instructed churchmen, or instructed dissenters. There would be nothing to hinder them from being taught religion, if their parents chose, at the same schools where they were taught other things. All attempts by the state to bias the conclusions of its citizens on disputed subjects, are evil; but it may very properly offer to ascertain and certify that a person possesses the knowledge, requisite to make his conclusions, on any given subject, worth attending to. A student of philosophy would be the better for being able to stand an examination both in Locke and in Kant, whichever of the two he takes up with, or even if with neither: and there is no reasonable objection to examining an atheist in the evidences of Christianity, provided he is not required to profess a belief in them. The examinations, however, in the higher branches of knowledge should, I conceive, be entirely voluntary. It would be giving too dangerous a power to governments, were they allowed to exclude any one from professions, even from the profession of teacher, for alleged deficiency of qualifications: and I think, with Wilhelm von Humboldt, that degrees, or other public certificates of scientific or professional acquirements, should be given to all who present themselves for examination, and stand the test; but that such certificates should confer no advantage over competitors, other than the weight which may be attached to their testimony by public opinion.

It is not in the matter of education only, that misplaced notions of liberty prevent moral obligations on the part of parents from being recognised, and legal obligations from being imposed, where there are the strongest grounds for the former always, and in many cases for the latter also. The fact itself, of causing the existence of a human being, is one of the most responsible actions in the range of human life. To undertake this responsibility--to bestow a life which may be either a curse or a blessing--unless the being on whom it is to be bestowed will have at least the ordinary chances of a desirable existence, is a crime against that being. And in a country either over-peopled, or threatened with being so, to produce children, beyond a very small number, with the effect of reducing the reward of labour by their competition, is a serious offence against all who live by the remuneration of their labour. The laws which, in many countries on the Continent, forbid marriage unless the parties can show that they have the means of supporting a family, do not exceed the legitimate powers of the state: and whether such laws be expedient or not (a question mainly dependent on local circumstances and feelings), they are not objectionable as violations of liberty. Such laws are interferences of the state to prohibit a mischievous act--an act injurious to others, which ought to be a subject of reprobation, and social stigma, even when it is not deemed expedient to superadd legal punishment. Yet the current ideas of liberty, which bend so easily to real infringements of the freedom of the individual, in things which concern only himself, would repel the attempt to put any restraint upon his inclinations when the consequence of their indulgence is a life, or lives, of wretchedness and depravity to the offspring, with manifold evils to those sufficiently within reach to be in any way affected by their actions. When we compare the strange respect of mankind for liberty, with their strange want of respect for it, we might imagine that a man had an indispensable right to do harm to others, and no right at all to please himself without giving pain to any one.

I have reserved for the last place a large class of questions respecting the limits of government interference, which, though closely connected with the subject of this Essay, do not, in strictness, belong to it. These are cases in which the reasons against interference do not turn upon the principle of liberty: the question is not about restraining the actions of individuals, but about helping them: it is asked whether the government should do, or cause to be done, something for their benefit, instead of leaving it to be done by themselves, individually, or in voluntary combination.

The objections to government interference, when it is not such as to involve infringement of liberty, may be of three kinds.

The first is, when the thing to be done is likely to be better done by individuals than by the government. Speaking generally, there is no one so fit to conduct any business, or to determine how or by whom it shall be conducted, as those who are personally interested in it. This principle condemns the interferences, once so common, of the legislature, or the officers of government, with the ordinary processes of industry. But this part of the subject has been sufficiently enlarged upon by political economists, and is not particularly related to the principles of this Essay.

The second objection is more nearly allied to our subject. In many cases, though individuals may not do the particular thing so well, on the average, as the officers of government, it is nevertheless desirable that it should be done by them, rather than by the government, as a means to their own mental education--a mode of strengthening their active faculties, exercising their judgment, and giving them a familiar knowledge of the subjects with which they are thus left to deal. This is a principal, though not the sole, recommendation of jury trial (in cases not political); of free and popular local and municipal institutions; of the conduct of industrial and philanthropic enterprises by voluntary associations. These are not questions of liberty, and are connected with that subject only by remote tendencies; but they are questions of development. It belongs to a different occasion from the present to dwell on these things as parts of national education; as being, in truth, the peculiar training of a citizen, the practical part of the political education of a free people, taking them out of the narrow circle of personal and family selfishness, and accustoming them to the comprehension of joint interests, the management of joint concerns--habituating them to act from public or semi-public motives, and guide their conduct by aims which unite instead of isolating them from one another. Without these habits and powers, a free constitution can neither be worked nor preserved, as is exemplified by the too-often transitory nature of political freedom in countries where it does not rest upon a sufficient basis of local liberties. The management of purely local business by the localities, and of the great enterprises of industry by the union of those who voluntarily supply the pecuniary means, is further recommended by all the advantages which have been set forth in this Essay as belonging to individuality of development, and diversity of modes of action. Government operations tend to be everywhere alike. With individuals and voluntary associations, on the contrary, there are varied experiments, and endless diversity of experience. What the State can usefully do, is to make itself a central depository, and active circulator and diffuser, of the experience resulting from many trials. Its business is to enable each experimentalist to benefit by the experiments of others, instead of tolerating no experiments but its own.

The third, and most cogent reason for restricting the interference of government, is the great evil of adding unnecessarily to its power. Every function superadded to those already exercised by the government, causes its influence over hopes and fears to be

more widely diffused, and converts, more and more, the active and ambitious part of the public into hangers-on of the government, or of some party which aims at becoming the government. If the roads, the railways, the banks, the insurance offices, the great joint-stock companies, the universities, and the public charities, were all of them branches of the government; if, in addition, the municipal corporations and local boards, with all that now devolves on them, became departments of the central administration; if the employes of all these different enterprises were appointed and paid by the government, and looked to the government for every rise in life; not all the freedom of the press and popular constitution of the legislature would make this or any other country free otherwise than in name. And the evil would be greater, the more efficiently and scientifically the administrative machinery was constructed--the more skilful the arrangements for obtaining the best qualified hands and heads with which to work it. In England it has of late been proposed that all the members of the civil service of government should be selected by competitive examination, to obtain for those employments the most intelligent and instructed persons procurable; and much has been said and written for and against this proposal. One of the arguments most insisted on by its opponents, is that the occupation of a permanent official servant of the State does not hold out sufficient prospects of emolument and importance to attract the highest talents, which will always be able to find a more inviting career in the professions, or in the service of companies and other public bodies. One would not have been surprised if this argument had been used by the friends of the proposition, as an answer to its principal difficulty. Coming from the opponents it is strange enough. What is urged as an objection is the safety-valve of the proposed system. If indeed all the high talent of the country _could_ be drawn into the service of the government, a proposal tending to bring about that result might well inspire uneasiness. If every part of the business of society which required organised concert, or large and comprehensive views, were in the hands of the government, and if government offices were universally filled by the ablest men, all the enlarged culture and practised intelligence in the country, except the purely speculative, would be concentrated in a numerous bureaucracy, to whom alone the rest of the community would look for all things: the multitude for direction and dictation in all they had to do; the able and aspiring for personal advancement. To be admitted into the ranks of this bureaucracy, and when admitted, to rise therein, would be the sole objects of ambition. Under this regime, not only is the outside public ill-qualified, for want of practical experience, to criticise or check the mode of operation of the bureaucracy, but even if the accidents of despotic or the natural working of popular institutions occasionally raise to the summit a ruler or rulers of reforming inclinations, no reform can be effected which is contrary to the interest of the bureaucracy. Such is the melancholy condition of the Russian empire, as is shown in the accounts of those who have had sufficient opportunity of observation. The Czar himself is powerless against the bureaucratic body; he can send any one of them to Siberia, but he cannot govern without them, or against their will. On every decree of his they have a tacit veto, by merely refraining from carrying it into effect. In countries of more advanced civilisation and of a more insurrectionary spirit, the public, accustomed to expect everything to be done for them by the State, or at least to do nothing for themselves without asking from the State not only leave to do it, but even how it is to be done, naturally hold the State responsible for all evil which befalls them, and when the evil exceeds their amount of patience, they rise against the government and make what is called a revolution; whereupon somebody else, with or without legitimate authority from the nation, vaults into the seat, issues his orders to the bureaucracy, and everything goes on much as it did before; the bureaucracy being unchanged, and nobody else being capable of taking their place.

A very different spectacle is exhibited among a people accustomed to transact their own business. In France, a large part of the people having been engaged in military service, many of whom have held at least the rank of non-commissioned officers, there are in every popular insurrection several persons competent to take the lead, and improvise some tolerable plan of action. What the French are in military affairs, the Americans are in every kind of civil business; let them be left without a government, every body of Americans is able to improvise one, and to carry on that or any other public business with a sufficient amount of intelligence, order, and decision. This is what every free people ought to be: and a people capable of this is certain to be free; it will never let itself be enslaved by any man or body of men because these are able to seize and pull the reins of the central administration. No bureaucracy can hope to make such a people as this do or undergo anything that they do not like. But where everything is done through the bureaucracy, nothing to which the bureaucracy is really adverse can be done at all. The constitution of such countries is an organisation of the experience and practical ability of the nation, into a disciplined body for the purpose of governing the rest; and the more perfect that organisation is in itself, the more successful in drawing to itself and educating for itself the persons of greatest capacity from all ranks of the community, the more complete is the bondage of all, the members of the bureaucracy included. For the governors are as much the slaves of their organisation and discipline, as the governed are of the governors. A Chinese mandarin is as much the tool and creature of a despotism as the humblest cultivator. An individual Jesuit is to the utmost degree of abasement the slave of his order, though the order itself exists for the collective power and importance of its members.

It is not, also, to be forgotten, that the absorption of all the principal ability of the country into the governing body is fatal, sooner or later, to the mental activity and progressiveness of the body itself. Banded together as they are--working a system which, like all

systems, necessarily proceeds in a great measure by fixed rules--the official body are under the constant temptation of sinking into indolent routine, or, if they now and then desert that mill-horse round, of rushing into some half-examined crudity which has struck the fancy of some leading member of the corps: and the sole check to these closely allied, though seemingly opposite, tendencies, the only stimulus which can keep the ability of the body itself up to a high standard, is liability to the watchful criticism of equal ability outside the body. It is indispensable, therefore, that the means should exist, independently of the government, of forming such ability, and furnishing it with the opportunities and experience necessary for a correct judgment of great practical affairs. If we would possess permanently a skilful and efficient body of functionaries--above all, a body able to originate and willing to adopt improvements; if we would not have our bureaucracy degenerate into a pedantocracy, this body must not engross all the occupations which form and cultivate the faculties required for the government of mankind.

To determine the point at which evils, so formidable to human freedom and advancement, begin, or rather at which they begin to predominate over the benefits attending the collective application of the force of society, under its recognised chiefs, for the removal of the obstacles which stand in the way of its well-being; to secure as much of the advantages of centralised power and intelligence, as can be had without turning into governmental channels too great a proportion of the general activity, is one of the most difficult and complicated questions in the art of government. It is, in a great measure, a question of detail, in which many and various considerations must be kept in view, and no absolute rule can be laid down. But I believe that the practical principle in which safety resides, the ideal to be kept in view, the standard by which to test all arrangements intended for overcoming the difficulty, may be conveyed in these words: the greatest dissemination of power consistent with efficiency; but the greatest possible centralisation of information, and diffusion of it from the centre. Thus, in municipal administration, there would be, as in the New England States, a very minute division among separate officers, chosen by the localities, of all business which is not better left to the persons directly interested; but besides this, there would be, in each department of local affairs, a central superintendence, forming a branch of the general government. The organ of this superintendence would concentrate, as in a focus, the variety of information and experience derived from the conduct of that branch of public business in all the localities, from everything analogous which is done in foreign countries, and from the general principles of political science. This central organ should have a right to know all that is done, and its special duty should be that of making the knowledge acquired in one place available for others. Emancipated from the petty prejudices and narrow views of a locality by its elevated position and comprehensive sphere of observation, its advice would naturally carry much authority; but its actual power, as a permanent institution, should, I conceive, be limited to compelling the local officers to obey the laws laid down for their guidance. In all things not provided for by general rules, those officers should be left to their own judgment, under responsibility to their constituents. For the violation of rules, they should be responsible to law, and the rules themselves should be laid down by the legislature; the central administrative authority only watching over their execution, and if they were not properly carried into effect, appealing, according to the nature of the case, to the tribunal to enforce the law, or to the constituencies to dismiss the functionaries who had not executed it according to its spirit. Such, in its general conception, is the central superintendence which the Poor Law Board is intended to exercise over the administrators of the Poor Rate throughout the country. Whatever powers the Board exercises beyond this limit, were right and necessary in that peculiar case, for the cure of rooted habits of maladministration in matters deeply affecting not the localities merely, but the whole community; since no locality has a moral right to make itself by mismanagement a nest of pauperism, necessarily overflowing into other localities, and impairing the moral and physical condition of the whole labouring community. The powers of administrative coercion and subordinate legislation possessed by the Poor Law Board (but which, owing to the state of opinion on the subject, are very scantily exercised by them), though perfectly justifiable in a case of first-rate national interest, would be wholly out of place in the superintendence of interests purely local. But a central organ of information and instruction for all the localities, would be equally valuable in all departments of administration. A government cannot have too much of the kind of activity which does not impede, but aids and stimulates, individual exertion and development. The mischief begins when, instead of calling forth the activity and powers of individuals and bodies, it substitutes its own activity for theirs; when, instead of informing, advising, and, upon occasion, denouncing, it makes them work in fetters, or bids them stand aside and does their work instead of them. The worth of a State, in the long run, is the worth of the individuals composing it; and a State which postpones the interests of _their_ mental expansion and elevation, to a little more of administrative skill, or of that semblance of it which practice gives, in the details of business; a State which dwarfs its men, in order that they may be more docile instruments in its hands even for beneficial purposes, will find that with small men no great thing can really be accomplished; and that the perfection of machinery to which it has sacrificed everything, will in the end avail it nothing, for want of the vital power which, in order that the machine might work more smoothly, it has preferred to banish.

Narzißmus als Doppelrichtung.

Von LOU ANDREAS-SALOMÉ.

I.

Was es auf sich hat mit dem _Freud_schen Narzißmusbegriff, das stellte sich erst allmählich immer bedeutsamer heraus, und erklärt damit vielleicht, warum, auch bei Gegnern und Dissidenten, der Name so wenig diskutiert wurde, als deckten bereits sonstige Benennungen den gleichen Begriff. Ursprünglich, solange Narzißmus tautologisch für Autoerotismus stand, war das ja in der Tat der Fall; als _Freud_ ihn dann übernahm, zur Kennzeichnung jener Libidophase, wo, nach autoerotischer Selbst- und Weltverwechslung des Säuglings, die erste Objektwahl auf das Subjekt selber fällt, da rührte er dadurch zugleich schon an ein weiterreichendes Problem: »Das Wort 'Narzißmus' will betonen, daß der Egoismus auch ein libidinöses Problem sei, oder, um es anders auszudrücken, der Narzißmus kann als die libidinöse Ergänzung des Egoismus betrachtet werden.« (_Freud_, Metaps. Erg. d. Trl.) Also kein Beschränktsein auf einzelnes Libidostadium, sondern als unser Stück Selbstliebe alle Stadien begleitend; nicht primitiver Ausgangspunkt der Entwicklung nur, sondern primär im Sinne basisbildender Dauer bis in alle spätern Objektbesetzungen der Libido hinein, die darin ja, nach _Freuds_ Bild dafür: nur, der Monere gleich, Pseudopodien ausstreckt, um sie nach Bedarf wieder in sich einzubeziehen. Allerdings stellte _Freuds_ Einführung des Narzißmusbegriffs in die theoretische Psychoanalyse von vornherein zu dessen Definition fest, daß die psychischen Energien: »im Zustande des Narzißmus beisammen und für unsre grobe Analyse ununterscheidbar sind, und daß es erst mit der Objektbesetzung möglich wird, eine Sexualenergie, die Libido, von einer Energie der Ichtriebe zu unterscheiden.« Mithin als Grenzbegriff gesetzt, über den Psychoanalyse nicht hinaus kann, bis zu dem hin sie jedoch therapeutisch zu dringen hat, als dem Punkt, wo krankhafte Störung erst ganz sich zu lösen, Gesundheit sich zu erneuen vermag, weil »krank« und »gesund« daran letztlich falsche oder rechte Aufeinanderbezogenheiten der zwei innern Tendenzen bedeuten, je nachdem diese sich hemmen oder fördern.

Indem beides sich am personellen Träger vollzieht, grenzt es, mit dessen steigender Bewußtheit seiner selbst, sich desto undeutlicher voneinander ab: macht den Umstand immer noch unmerklicher, daß im libidinös Gerichteten sich etwas durchsetzt, was der Einzelperson als solcher entgegengerichtet bleibt, was sie löst, zurücklöst in dasjenige, worin sie vor ihrer Bewußtheit noch für alles stand, wie alles gesamthaft für sie. Denn sollen Icherhaltungs-, Selbstbehauptungstriebe sich von libidinösen überhaupt begrifflich streng trennen, so kann Libido nichts anderes besagen als eben diesen Vorgang: diesen Bindestrich zwischen erlangter Einzelhaftigkeit und deren Rückbeziehung auf Konjugierendes, Verschmelzendes; im narzißtischen Doppelphänomen wäre sowohl die Bezugnahme der Libido auf uns selbst ausgedrückt als auch unsere eigene Verwurzelung mit dem Urzustand, dem wir, entsteigend, dennoch einverleibt blieben, wie die Pflanze dem Erdreich, trotz ihres entgegengesetzt gerichteten Wachstums ans Licht. Wie wir ja auch in den Körpervorgängen die geschlechtliche Weitergabe gebunden sehen an indifferenziert bleibende kleinste Totalitäten, und wie in unseres Körpers »erogenen Zonen« Überlebsel wirksam sind eines Infantilstadiums, aus dem die Organe sich längst in Dienstbarkeit der Icherhaltung aufteilten(1). Die Frage lautet auch gar nicht: ob's theoretisch vielleicht doch angängig sei, den narzißtischen Doppelsinn eindeutig zu fassen, sei es, den Ichtrieb der Libido zu überantworten (als entspräche z. B. auch das Ernährungsbedürfnis noch einer Art von Konjugation mit dem Außer-uns), oder

umgekehrt die Libido dem Bemächtigungsbestreben des einzelnen (als einer Ich-Habgier), zu unterstellen. Nein, nicht solches ist die Grundfrage, sondern es geht um die innere Verschiedenheit von Erlebnissen, die durch zweierlei Namengebung auseinandergehalten wird, anstatt durch gewaltsames Vereinheitlichen des Begriffs sie zu verwischen. Nachgehen, so weit wie möglich, so tief wie tunlich, den verborgenen lebendigen Tatbeständen: um das handelt sichs _Freud_scher Psychoanalyse, und dazu allein bedient sie sich des populären Gegensatzes von Ich- und Sexualtrieben. Darum erschiene es mir als Gefahr, wenn am Narzißmus seine Doppelseitigkeit nicht als sein Wesentliches betont bliebe, wenn durch Wortverwechslung mit bloßer Selbstliebe sein Problem sich sozusagen ungelöst erledigte. Ich möchte deshalb jene andere, fürs Ichbewußtsein zurücktretende, Seite daran -- die der festgehaltenen Gefühlsidentifizierung mit allem, der Wiederverschmelzung mit allem als positivem Grundziel der Libido(2), an einigen Punkten hervorkehren, und zwar an dreien: innerhalb unserer Objektbesetzungen, innerhalb unserer Wertsetzungen, und innerhalb narzißtischer Umsetzung ins künstlerische Schaffen.

(1) Absichtlich rede ich hier nicht von Ichtrieb und »Arttrieb«: namentlich seit der teleologischen Wendung des Wortes bei C. G. _Jung_ besinnt man sich besser darauf, wie unausrottbar viel Teleologie sich darin festgenistet hat, schon von _Schopenhauer_ und vom Evolutionismus her trotz dessen betonter Naturwissenschaftlichkeit der Auffassung. (Vgl. dazu die Klarstellung durch Carl _Abraham_ bereits in der Intern. Zeitschr. III, p. 72.) Insbesondere die infantile Sexualität, die grundlegende für alle spätere, läßt sich mit Arttrieb am wenigsten decken: da aber mit der Elternschaft, dem Kind-Ebenbilde, auch wiederum unser Narzißmus erst recht auflebt, so brächte auch sogar bei Fortpflanzung der Art uns das Wort noch um keine einzige Station weit vom Ich ab.

(2) In der Tat läßt sich nur durch Hinweis auf den positiven Charakter der _passiven_ Libidokomponente diese genügend unterscheiden von einer bloßen »Attitüde« unseres Ich-Machtstrebens: wie A. _Adler_ sie auffaßt, der dadurch zu intellektualistischer Verkürzung und Vereinfachung der psychischen Vorgänge kommt. Allerdings zu einer, die ihm manche Anhänger sichern mag, welche von _Freud_ abfielen, weil mit der bösen Sexualität nicht zu spaßen war als einem bloßen »Jargon« der Gefühlsäußerung. Aber den Mangel eines positiven Zweierlei -- das, für unsere menschliche Blickmethode, nun einmal überall wirksam wird, wo sich Leben regt -- muß auch A. _Adler_ sich irgendwie ersetzen: in der Schroffheit und Starrheit der libidinösen bloßen Fiktion, erscheint diese -- obwohl ein Minderwertigkeitsanzeichen -- schließlich als dermaßen allgemein und wesentlich, daß »Psychisches« geradezu damit in eins zu fassen wäre, d. h. der Gesunde, Nichtminderwertige, verlegen würde um hinreichende Beschaffung von Psyche.

Zunächst jedoch, schon vorweg des »trocknen Tones satt«, möchte ich von einem Bübchen erzählen, an dem mir besonders eindringlich zu beobachten vergönnt war, wie wir mit unserm Ichwerden nicht nur in die neuen Freuden bewußterer Selbstliebe drängen, sondern nicht minder das Ich sich uns vorerst aufdrängen kann als Einbuße an der Lust passiver Aufgenommenheit in das von uns noch nicht voll Unterschiedene. Um die Zeit dieses Doppelereignisses von Einbuße und Zuschuß begann das Bübchen sich aus einem zärtlich zutraulichen in ein weinerlich erbostes zu wandeln; es schlug, und nicht zum Scherz, die sehr geliebte Mutter, zeigte abwechselnd Zorn- und Angstzustände, und hätte sein Leid doch kaum klarer auszudrücken vermocht, als einst ein kleiner sprachkundigerer Leidensgenosse es dem geärgerten Vater gegenüber mit dem bittern Vorwurf tat: »Du bist so frech, und ich bin so traurig.« Die letzte Ursache zu alledem stellte sich damit heraus, daß das Leid sich löste, sobald das Bübchen aufgehört hatte, von sich in dritter Person zu reden, sobald, gleich schmerzlich durchbrechendem Zahn, das erste »Ich« sich ihm entrang. Einstweilen aber galt das neue Wort nur bei den, alltäglich gewordenen, Zusammenstößen mit der Umwelt; die Augenblicke alter Harmonie fanden immer noch statt des »Ich« das »Bubele« vor. So erklärte er jemandem, der ihn in den Winkel gestellt sah: »Ik bös!« hinterdrein jedoch, strahlend auf die Mutter zulaufend, verkündigte er: »Bubele wieder gut!« Erst nach Monaten trat endgültig das Bubele zurück, und ein völlig anderes als das verzweifelt böse Gesicht lugte durch den Türspalt herein, wenn er, eintretend, mit betonter Würde, die Anwesenden wissen ließ: »Ik komme!« Nun erst war die ständige Gekränktheit, die tiefe, erschrockene, geschwunden, unser aller Urkränkung: über das unbegreifliche Sichpreisgegebensehen an die eigene Vereinzelung, deren Unbegreiflichkeit sie eben als von außen bedingte erscheinen ließ. Mit jedem Schlag oder Schrei wider geliebte Personen, jedem rächenden Wehetun hatte zugleich letzte Wollust sich ausgeschwelgt, etwa in den Tränen der Mutter die verlorene Identität schmerzhaft wiedergenießend. Wie solcher kindliche Sadismus für die meiner Ansicht nach bisweilen doch nur sekundäre Natur des Sadistischen spricht, wenigstens als Umschlag aus unsern noch unbewußten Identifizierungen, so zeigt er vielleicht auch, wie unerhört nahe der Ödipuskomplex ihm gelegen ist: gerade seine überraschende Kraßheit gewinnend aus dieser Überstülpung der schweifenden Gefühlsweite in die Enge des Bewußtwerdens der eigenen Vereinzelung und damit in die Ichaggression. Übrigens war beim Bübchen mit der Ichgeburt der innere Widerstreit noch nicht vollends abgetan: das geschah erst durch eine Erscheinung, von der ich wohl weiß, daß ihr, durchaus nicht seltenes Vorkommen recht verschieden begründet sein kann, die in diesem Sonderfall sich aber gar deutlich als Notersatz für die eingebüßte Allesbedeutung betrug. Das Bübchen schmuggelte nämlich einen kleinen unsichtbaren Gefährten in die Welt seiner neuen Erfahrungen ein, dessen leiblichen Umriß er

einem Bilderbuch entnahm, worin blumenbekränzten Kindern ein lustiger Junge voraufsprang, mit den Worten darunter: der Mai ist gekommen. Junge Mai ergab fortan den ergänzenden Doppelgänger zu des Bübchens jeweiliger Schicksalslage: er hatte, je nach Bedarf, als froh oder betrübt, brav oder bös, beschenkt oder bestraft, ja als tot oder lebendig ihm das Komplement zu stellen; ergings dem Bübchen wenig nach Wunsch, so labte es sich an des Mai's um so ungemessenern Wunscherfüllungen; wo aber des Glückes Überfluß das Bübchen umzuwerfen drohte (wie zu Weihnachten angesichts des Baumes und der Gabenfülle), da entschied es kurzerhand: »heute dem Mai _nichts_!«, und beidemale war ersichtlich, daß nicht Neid oder Schadenfreude daran mitwirkten: am glücklicheren Mai tröstete, am leer ausgehenden Mai mäßigte das Bübchen _sich_, in jener einzig echten »Selbstlosigkeit« des noch nicht ganz zu Alleinbesitz mit sich gelangten Selbst. Im gleichen Grade, wie dieser Alleinbesitz sich festigte, erschien der Mai minder ständig, hatte er weiteren Weg zurückzulegen bis ans Haus, das er anfänglich mitbewohnte; später zog er gar in eine benachbarte Ortschaft und endlich mußte er sich zu Bahnbenutzung bequemen und Bahnzeiten innehalten. Als ich nach Bayern abreiste, bekam ich ihn zum Reisegeleit, und bei mir verstarb er des Todes, wodurch er sozusagen bayerisch lokalisiert blieb, nach meinem Aufenthalt befragt, versicherte das Bübchen drum: »die Lou, die ist nun im Himmel.« Hinzuzufügen bliebe noch, daß -- gewissermaßen entlang am Mai -- des Bübchens Selbstbewußtsein und -vertrauen ganz sonderlich erstarkten und nicht leicht etwas den Vergleich mit diesem Ik aushielt, ferner aber, daß es noch jetzt (mit drei Jahren) einen Anlaß gibt, wo der Mai wieder erscheint, wenn auch »nur nachts«: das ist, wenn dies ungemein musikalische Bübchen auf einen psalmodierenden Singsang verfällt, den es in einer letzten Bescheidenheit -- und dies ist interessant -- unter keinen Umständen dem vielvermögenden Ik allein zubilligt.

Gerade wie späterhin unsere Libido bereits bewußte Eigenschaft am Ich geworden, Angst erleidet bei Verdrängen, Hemmen unseres Bemächtigungsbestrebens, so kann sie es vorher erleiden auch infolge noch zögernden Zustimmens zur Herausbildung einer als eng und einzeln betonten Person; auch dies wirkt gleich Verdrängungsschüben, durch die sich in abgegrenztes Flußbett bequemen muß, was sich Meer gewähnt. Entsprechend der letztbemerkten Mission des Mai scheint das am längsten vorzuhalten bei Kindern mit starker Phantasietätigkeit, und ist aus wesentlich späteren Jahren als die des Bübchens mir zur Beobachtung gelangt. Von mir selbst entsinne ich mich eines hergehörigen Vorfalls aus meinem -- sehr ungefähr berechnet -- siebenten Jahr, den freilich ausnahmsweise Umstände begleiteten, die hier zu erörtern zu weit führen würde, sie fanden statt durch erstmaliges verfrühtes Hinausgeraten aus kindfrommer Gläubigkeit, also aus jener Gottgeborgenheit, die nicht unähnlich einer letzten geistigen Eihaut das Menschenkind umhüllen mag, mit ihrem Zerreißen die Ichgeburt in die Weltfremde(3) in gewissem Sinn erst vollendend. Es betraf einen Eindruck vor dem eigenen Spiegelbild: wie jähes, neuartiges Gewahrwerden dieses Abbildes als eines Ausgeschlossenseins von allem übrigen; nicht wegen etwas am Aussehn (z. B. als eines schöner phantasierten oder aber gewissenweckend infolge der Zweifelsünde jener Zeit), sondern die Tatsache selber, ein Sichabhebendes, Umgrenztes zu sein, überfiel mich wie Entheimatung, Obdachlosigkeit, als hätte sonst alles und jedes mich ohne weiteres mitenthalten, mir freundlich Raum in sich geboten(4). Natürlich erfahren Kinder und Kranke eher von dieser Unheimlichkeit, sich gerade an der Ichschranke zum bloßen Bildspuk, zu äffendem Schein zu werden, als ausgewachsene Normalmenschen, die nur der entgegengesetzte Umstand, diese Schrankensicherheit könne sich verflüchtigen, aus ihrer Fassung würfe. Wie beim Kinde das noch nicht gefestigte Ichbewußtsein, so legt beim psychotisch Erkrankten der Ichzerfall, jene andere Seite am Narzißtischen bloß, wo sich am Narzißmus erweist, daß er sich eben nicht mit »Selbstliebe« ganz deckt: weshalb der Psychot uns so viel darüber aussagt bei und durch Verlust seiner Ichgrenzen; indem er seine Fähigkeit zu Übertragung, zu Objektbesetzung, als nur vom Ich aus mögliche, einbüßt, regrediert er bis dorthin, wo man auf Einzelnes als solches, und so auch auf sich als den einzelnen, nicht mehr überträgt: nur daß ihm, wie dem Säugling, die beide allein diesen Zustand in so reiner Halbheit erfahren, das kennzeichnende Wort dafür fehlt, wir aber mit unsern Bezeichnungen schon stecken bleiben in der Mischung beider Hälften zu ununterscheidbarer Ganzheit, die uns nun bloß vom andern Rande her zu begutachten gegeben ist. Freilich gabs und gibts Leute, denen Namen auch für jenes Wortlose zu Gebote stehn, aber nur solche Namen, die das Unnennbare daran unterstrichen, um daraus das Recht abzuleiten, mit ihren Wörtern wie mit Entiteten umzugehn: das sind die Metaphysiker insbesondere älteren Datums: Doch wie wäre es, wenn wir eben die Nebulosität derartiger Ausdrücke uns zu nutze machten für andersartigen Zweck: für Unterscheidungen praktischer und faktischer Erlebnisseiten an unseren inwendigen Menschen? Nämlich so, wie zweifellos nur des Gläubigen klassische Religionssprache uns über fromme Zustände am deutlichsten belehrt, so auch des Metaphysikers Redewendungen über gewisse Existenzweisen an unserm Erleben, die für die Ichpsychologie, wie Sterne am Tage, unsichtbar werden; der große Fromme, der große Philosoph sind gleichermaßen Ausdrucksmächtige um deswillen, daß sie, wie der Psychoanalytiker ja nur zu gut weiß, ihre heißesten Antriebe aus der narzißtischen Urmacht bewahrten. Sie können den Erforscher menschlicher Seele ebenso beschenken, wie es sogar, hie und da, aus gleichem Grunde, der Psychot tut.

(3) Das Nähere ist verwendet in einer (bei _Diederichs_, Jena) erscheinenden Kindergeschichte: »Die Stunde ohne Gott.« Ein Thema übrigens, dem es sich lohnen würde, öfter forschend nachzugehen, insofern jeder Mensch unter irgend welchen Glaubensvorstellungen aufzuwachsen pflegt, und die entscheidende Stunde seines erstmaligen Zweifels -- nicht notwendig schon des theoretisch bedingten, häufig viel später und viel weniger tief wirksamen -- kennzeichnend bleibt für sein ganzes Wesen, auch wenn dies praktisch Erfahrene zunächst wieder mit theoretischer Bemühung verdrängt wird.

(4) In dem vortrefflichen Buch von G. _Róheim_ scheint mir bei Erklärung der Spiegelriten die narzißtische Doppelrichtung ebenfalls nicht genügend beachtet: wieviel auch in den Verboten und Geboten darauf beruht, daß vom Ich, seiner Selbstbespieglung, seinen Gewissensbissen, seiner sozialen Schädigung, seiner Gefährdung ausgegangen wird, die entgegengesetzte Seite kam sicherlich ergänzend hinzu in der Scheu des Ich vor sich selbst als dem in Begrenzung gebundenen.

Ein wenig hat es der Taufpate des Terminus, der Spiegelheld Narziß, auf dem Gewissen, wenn dabei zu einseitig die ichbeglückte Erotik allein herausblickt. Aber man bedenke, daß der Narkißos der Sage nicht vor künstlichem Spiegel steht, sondern vor dem der Natur: vielleicht nicht nur sich im Wasser erblickend, sondern auch sich _als alles_ noch, und vielleicht hätte er sonst nicht davor verweilt, sondern wäre geflohen? Liegt nicht in der Tat über seinem Antlitz von jeher neben der Verzücktheit auch die Schwermut? Wie dies beides sich bindet in eins: Glück und Trauer, das sich selber Entwendete, das auf sich selbst Zurückgeworfene, Hingegebenheit und eigene Behauptung: das würde ganz zum Bild nur dem Poeten(5).

(5)

»-- Dies also: dies geht von mir aus und löst sich in der Luft und im Gefühl der Haine, entweicht mir leicht, und wird nicht mehr die Meine und glänzt, weil es auf keine Feindschaft stößt.

Dies hebt sich unaufhörlich von mir fort, ich will nicht weg, ich warte, ich verweile; doch alle meine Grenzen haben Eile, stürzen hinaus und sind schon dort.

Und selbst im Schlaf: nichts bindet uns genug. Nachgiebige Mitte in mir, Kern voll Schwäche, Der nicht sein Fruchtfleisch anhält. Flucht, o Flug von allen Stellen meiner Oberfläche. --

Jetzt liegt es offen in dem teilnahmlosen zerstreuten Wasser, und ich darf es lang anstaunen unter meinem Kranz von Rosen.

Dort ist es nicht geliebt. Dort unten drin ist nichts als Gleichmut überstürzter Steine, und ich kann sehen, wie ich traurig bin.« --

(Aus: »Narziß« von Rainer Maria _Rilke_. Manuskript.)

II.

Daß auch Objektliebe auf Selbstliebe zurückgeht, daß davon tatsächlich jenes Akrobatenkunststück der Monere gilt, mit deren einziehbaren Scheingliedern _Freud_ sie drastisch verglich, das ist psychoanalytisch nach allen Seiten hin aufschlußgebend und belehrend geworden. Wie in des heiligen Augustins: »ich liebte die Liebe«, erscheinen jeweilige Objekte zutiefst als bloße Anlässe, einen Liebesüberschuß daran abzuladen, der auf uns selbst bezogen, und nur, sozusagen, nicht recht unterzubringen gewesen ist. Die Frage, wodurch wir überhaupt aus unserer Selbstliebe in Objektlibido hinausstoßen, wurde ja auch mehrfach von _Freud_ im Sinne eines solchen überschüssigen Zuviel erörtert. Nun meine ich, eben dies »Allzuviele« daran ergibt sich aus dem Umstand, daß es bereits vom Hause aus, als _Richtung des Verhaltens_, unsere Ichgrenzen als solche nicht berücksichtigt, sondern übersteigt, _nicht ihnen gilt_, ja ihnen entgegen steht, was nur wieder bedeutet: es ist narzißtisch bedingt, d. h. in aller Selbstbehauptung zugleich Wiederauflösungswerk am Selbst. Sicherlich gibt es auch die ganz eigentliche, bewußt auf uns gerichtete Selbstliebe, die dann vom Ichvorteil, nicht von der Wollust her, ihre Befriedigung bezieht. Aber auch die echte Wollust wird, indem sie am Selbst sich ausläßt, von diesem Selbst für den forschenden Blick leicht überdeckt, und noch ihr Zuviel umfließt es scheinbar als ihren Mittelpunkt. Erst an der Objektbesetzung zeichnet sich die Libido ja als etwas für sich ab, in den Umrissen des Objekts wird sie uns deshalb erst libidinös umrissen. Dahinter aber liegt, nach wie vor, weit ausgebreitet das Land, daraus sie stammt, und was sich im Vordergrund in der Einzelfigur des Objekts so groß davon abhebt, berückt uns nur, weil es diese Landestracht trägt. Ich denke mir: die _Freud_sche »Sexualüberschätzung«, das Bemühen, das Libidoobjekt zu erhöhen, mit allem Schönen und Wertvollen auszustaffieren, kommt von daher: sie sucht es ganz und gar zum würdigen, passenden Stellvertreter dessen zu machen, was, im Grunde immer noch allumfassend, sich schließlich daran ebenso schwer völlig anwenden, unterbringen läßt, wie innerhalb des Subjekt-Objekts selber. Letzten Endes steht jedes Objekt so stellvertretend, als -- im streng

psychoanalytischen Wortsinn verstanden -- »Symbol« für sonst eben unausdrückbare Fülle des unbewußt damit Verbundenen. Libidinös geredet besitzt keine Objektbesetzung andere Realität als solche symbolische; der Lustbezug daraus gleicht durchaus dem, was _Ferenczi_ einmal als »Wiederfindungslust« beschreibt: »die Tendenz, das Liebgewordene in allen Dingen der feindlichen Außenwelt wiederzufinden, ist wahrscheinlich auch die Quelle der Symbolbildung«(6). Fügen wir hinzu: damit auch die der Objektlibido als letztlich narzißtisch entspringender und gespeister. Die psychoanalytische Einsicht: daß auch spätere Liebesobjekte Übertragungen aus frühesten seien, gilt eben grundsätzlich: »Libidoobjekt« heißt Übertragensein aus noch ungeschiedener Subjekt-Objekteinheit in ein vereinzeltes Außenbild; und dieses ist damit genau so wenig in bloßer Vereinzelung gemeint, wie wir uns selber libidinös mit unsrer Einzelhaftigkeit bescheiden, wie wir vielmehr unsere Grenzen unwillkürlich darin zu übersehen, geringzuachten suchen.

(6) Zur Unterscheidung vom andern Lustbezug: demjenigen bloß ersparten Kraftaufwands, wie er _Freuds_ Witztechnik zugrunde liegt. (_Ferenczi_, Analyse von Gleichnissen, »Intern. Zeitschrift«, III, 5., p. 278.)

Bekanntlich redet _Freud_ von »Sexualüberschätzung« als von etwas, wobei unser Narzißmus ein wenig allzugründlich sein »Zuviel« an Libido ausgibt, woran er verarmt, leidet, um erst durch das Erfahren von Gegenliebe wieder frisch aufgefüllt zu werden. Dies kehrt sich jedenfalls am schärfsten hervor bei solcher Libido, die damit in zu schroffem Gegensatz gerät zum ichhaften Bemächtigungsbestreben, also bei männlich gearteter. Um ganz zu bemerken, wie gewißlich unser Narzißmus gerade an seinen Sexualüberschätzungen, seiner Ich-Zurückdrängung sich auch bereichert und steigert, muß man ihn vielleicht insbesondere dort betrachten, wo er sich nicht so weit in den Ichbezirk hinein »vermännlichte«, oder wo er, ehe das geschah, einen Rückschub erfuhr in das Infantilere, der ichbewußten Aggressivität ferner Bleibende. Man wolle nicht denken, daß damit die Libido des Weibtums mit ihrem von _Freud_ geschilderten Umkipp (von der Klitorissexualität in die passiv gewendete der Vagina) überwichtig genommen werden soll: aber kommt bei ihr die Egoseite des Narzißmus wiederum zu kurz, so gestattet sie doch dafür unverkürzt den Einblick in die andere, sonst uns allzu abgekehrt verbleibende Seite seines Wesens. Die Wollust, sich selber zu überrennen, sich nicht als Ich im Wege zu stehen beim beseeligenden Wiedererleben noch ichfremden Urzustandes, erhöht sich daran unter Umständen masochistisch, sowohl den körperlichen Schmerz als auch die Situation der Demütigung bejahend. Dem Ich gegenüber also _widerspruchsvoll_, da: »die Verkehrung der Aktivität in Passivität und Wendung gegen die eigene Person eigentlich niemals am ganzen Betrag der Triebregung vorgenommen wird«. (_Freud_, Trieb und Triebschicksale.) Eben dieses Paradoxon des Erlebens rückt jedoch erst voll ins Licht, inwiefern dem Narzißmus ein Doppelvollzug von Selbstbehauptung und von Schwelgen in noch Uneingegrenztem ur- und eigentümlich sei, wie _Freud_ ja überdies zugibt, wir hatten: »allen Grund anzunehmen, daß auch Schmerz, wie andere Unlustempfindungen, auf die Sexualerregung übergreifen und einen lustvollen Zustand erzeugen, um deswillen man sich auch die Unlust(7) des Schmerzes gefallen lassen kann« (wenn _Freud_ auch am sekundären Charakter des Masochismus festhalten will, als einer Reaktion auf vorangegangene, hinterdrein gleichsam nach Sühneschmerz verlangende Übergriffe). Innerhalb weiblich gerichteter Libido meine ich übrigens etwas vom sexuellen Urausdruck nicht nur verdeutlicht zu sehen in der Verschärfung zum masochistischen Zug, wo ja, ob auch negativ, das Ich als schmerzbedingendes, immerhin noch bedeutungsvoll mitwirkt; der Rückschub ins Passive gewährt überdies nämlich auch den erogenen Zonen dauernd ihren ursprünglichen Spielraum, als -- gegenüber dem Vorstoß ins Aktive -- dem Prinzip des Aufhaltenden, Verweilenden, also jener Zärtlichkeit, die hochgeeignet zur Beseelung, seelischen Verfeinerung der Leibesvorgänge, doch diese zugleich an ihre Kindergewohnheiten bindet; an infantile Erogenität des Gesamtleibes, an noch nicht punktuell einbezirkten Allkontakt sozusagen. Und endlich und nicht zum wenigsten, ist es der beharrende Überrest der Klitorissexualität selber, der, fürs Genitalziel überflüssig geworden, am Weibe sich an seinem infantilen Rückstand, sei es kindlicher oder kindischer, auslebt, bis -- -- ja vielleicht bis das Weib »das Kind« aus sich in die Welt hinausgeboren hat. Auf diesem Höhepunkt weiblicher Erfahrung aber, steht sie, die Erzeugerin, Ernährerin, Erzieherin des Kindes zugleich dem Wachstum ins Männliche nahe: _ihrem_ Stück Aktivität, darin fast doppelgeschlechtlich ergänzt, und eben drum wieder ins Urnarzißtische zurückgerundet, wie es auf der ganzen Welt sich nur ermöglicht im Bild der Mutter, die, sich selbst fortgebend, sich selbst an der Brust hält. Entsprechend dem Penis-Neid des Weibes findet man deshalb nicht selten beim Mann jenes Sichselbst-Wiedergebärenwollen (das sowohl zu unterscheiden wäre vom Zurückwollen in die geliebte Mutter = Gebärerin, als auch vom »inzestuosen Sich-eigner-Vaterseinwollen«); nach einigen Beobachtungen, die mir vorliegen, glaube ich darin eine weiblich umgemodelte Klitoris-Betonung zu sehen, indem ja, nach infantiler Annahme von der Analerotik her, die Klitoris auch etwas vom Leibe Ablösbares (den »Lumpf« aus _Freuds_ bekannter Kinderanalyse) bedeutet, wie es in mancher (natürlich nicht jeglicher) Schwangerschaftsphantasie männlicher Neurotiker sich ebenfalls Ausdruck schafft. Ich komme aber darauf, weil mir mehrfach auffiel, wie Mannbarwerden des Knaben zunächst als Bedrängtwerden von Fremdem empfunden wurde: als vergewaltigendes Außer-einem(8), das man in sich hineinzwingen, sich einverleiben möchte zu Besitz statt Besessenheit; bevor das »Zuviel« der Libido auf die Abfuhr ans Objekt verfällt, macht sie in

solchen Fällen sich bemerkbar _fast gleich einer Schädigung der narzißtischen Selbstliebe_, der Einheit von Libido und Ich: erst an der Objektbesetzung einen die beiden sich dann neu in der Gemeinsamkeit ihres Entzückens am Objekt.

(7) Vgl. hiezu die Schlußseiten von _Ferenczis_ »Von Krankheits- oder Pathoneurosen«, Intern. Zeitschr. IV, 5, wo von Masochismus und weiblicher Genitalität als sehr dunklen Problemen die Rede ist, und wo Körperverletzungen als Anlässe zu Regression auf ursprünglichen Hautmasochismus (die Haut infantilste erogene Zone!) erörtert werden.

Schon früh hat sich P. _Federn_ für den primären Charakter der »Passionslibido« ausgesprochen entgegen _Freuds_: »ein ursprünglicher Masochismus, der nicht -- -- -- aus dem Sadismus entstanden wäre, scheint nicht vorzukommen«. »Im Gegensatz dazu muß ich als sicher hinstellen, daß die Libido sowohl weiblich als männlich sein kann. (Intern. Zeitschr. II, 2, 119.)« »Das Kriterium des Masochismus ist -- -- die passive lustvolle Einstellung des Gesamt-Ichs. Menschen, die normale und masochistische Sexualität besitzen, geben an, daß die masochistische Sexualität 'durch das Gehirn gehe', sie nehmen die Überwältigung des ganzen Ichs selbst an«. Hiermit ist von P. _Federn_ für den primären Masochismus die Eignung zur vollen Liebesfähigkeit in Anspruch genommen, die sich nach _Freud_ kennzeichnet als »Relation des Gesamt-Ichs zu den Objekten«. (Samml. kl. Schr. z. N., IV, 274.)

(8) Verschiedene Träume aus der Knabenzeit gehören hieher; z. B. man ist mit sich selbst wie mit einer Vermummung umhüllt, Verkleidung oder Maske, da etwas darin steckt, das jeden Augenblick alles in Fetzen durchstoßen, zerreißen kann, und doch damit einen selber vernichten. Oder: man liegt neben offenem Grab, in das ein Grabstein hineinzustürzen droht, der dicht dabei hochragt und nur auf die erste unvorsichtige Bewegung wartet, denn _er_ gehört ja auf diese Öffnung, _einen selber_ aber begräbt sie.

So scheint _nicht so sehr die Objektbesetzung_, nicht die Sexualüberschätzung innerhalb ihrer, unserm Narzißmus gefährlich zu sein: wohl aber wird er seinerseits gefährlich dem Objekt der Libido; sein bleibendes Eingreifen verschuldet, daß es dabei diesem Objekt schließlich an den Kragen geht. Denn von vornherein nur zu einer Art von Stellvertreterschaft zugelassen, verflüchtigt es sich in seiner realen Beschaffenheit nur um so mehr und mehr, je gefeierter es auftritt. Die typischen Liebesenttäuschungen haben ihren letzten Grund, ihren unabwendbaren _hierin_: _nicht erst_ im Nachlassen der Liebe durch die Zeit oder durch enttäuschende Einsichten, denn, ganz abgesehen von diesem beiden hat das Objekt ja ganz eigentlich mit seinem Leibe dafür zu haften, daß es weit mehr als Leibhaftigkeit sei, und mit seinem, scheinbar doch erkorenen, auserwählten, Sonderwesen dafür, daß es im Grunde Allwesenheit sei. Je weiter Liebesekstase sich versteigt, ihr Objekt stets üppiger, ohne zu sparen, bereichernd, desto dünner, unterernährter bleibt das Objekt hinter seiner Symbolität zurück; je heißer unsere Schwärmerei, desto abkühlender diese Verwechslung, bis, auf richtiger Höhe, sich Brand und Frost fast identisch anfühlen (was das Schicksal der glücklichen Liebe fast unangenehmer als das der unglücklichen, der den Partner kühl lassenden aber selber schön warmbleibenden, machen kann). Auch hinter der reifgewordenen Genitallibido, die es mit den Realitäten am ernstesten nimmt, wächst dies symbolisierende Verfahren, das auch im Genitalen dennoch nur die narzißtischen Identifizierungen durchsetzen will: die keiner Objektbrücken im einzelnen bedürfen, über alles sich erstreckend aber auch nichts außer sich gelten lassend.

An der Objektlibido findet sich so manches, was ihr zugeschrieben wird, während mir scheint, daß es unter Umgehung ihrer, sich ziemlich direkt vom Narzißmus herleitet und nur in den eifrigen Symbolbildungen sich mit ihr zusammenfindet. Dazu gehört großenteils, was man Freundschaft zwischen verschiedenen Geschlechtern nennt. Bei der ungemein populären Diskussion dieses Themas beobachtete ich oft, wie sonderbar stark selbst unbefangen denkende Leute sich dagegen wehren, in Freundschaft nur eine Noch-nicht-, oder Schon-nicht-mehr-Liebe zu sehen, oder aber eine mit ihrer eigenen Verdrängung kämpfende. Meinem Eindruck nach liegt dies daran, daß im Freundschaftsbündnis allerdings Sexualanteile genug stecken, häufig jedoch solche, die ursprünglich nicht dem Partner zukommen, sondern sich dem Bunde mit ihm beigesellten von anderwärts: nämlich aus Aufarbeitungen vom Narzißtischen her, in Sublimierungen aus Infantilismen. Die Empfindung gewisser Nichtsexualität dem Freunde gegenüber bestünde damit zu Recht; nicht in gegenseitiger Erotik, sondern in etwas Drittem wurzelte sie: gleichviel, ob sie erwüchse aus noch immer infantilen Interessen oder erblühte zu hochvergeistigtesten, gleichviel ob die Freunde nun eins in Gott sein mögen, oder auch nur beim Sammeln oder Angeln. Das Wesentliche bleibt, daß, wie geliebt und anerkannt auch immer, der Freund letztlich gewertet, ja verklärt gewissermaßen, sei, er es doch erst von diesem Dritten aus wird, das im übrigen sogar fester zu binden imstande ist als Personalerotik, da, abgelenkt vom Sexualziel der Leibesbesitznahme, dafür unserer so aufgearbeiteten Libido gleichsam sich alles zu Besitz bietet, worauf sie nur irgend verfällt; in Sublimierung ihrer allerältesten autoerotischen Praxis kommt sie sozusagen zu einer geselligen Selbst- und Weltverwechslung à deux. Gut verarbeitetem und dadurch -- außerhalb der Genitallibido -- entwicklungsfröhlichem Narzißmus ist eben breiteste Umfassung freigegeben, zum Entgelt für die genitallibidinöse Enge sonstiger Partnerumarmung. Man könnte ja den schlechten Witz machen: unserm alten Autoerotismus, einstmals übers ganze Kinderkörperchen verteilt, gelänge es in den Sublimationsanstrengungen einfach, uns allmählich aus den Gliedern zu Kopfe

zu steigen, als recht eigentlicher »Verlegung von unten nach oben«. Von diesem Sprungbrett nun aber, gelingt ihm jener gewaltige Absprung erst, der die Bedeutung der Libido fürs kulturelle Leben überhaupt erneut, der Sprung vom _leibhaft Libidobetonten in die Welt sachlicher Betonungen_, von infantilster Selbstbezogenheit mitten hinein ins Außen-gegenüber. Dies Außen nicht symbolistisch verbrämend, sondern sachlich begutachtend, es real nutzend. Dadurch, daß es immer wieder noch unser Narzißmus selbst ist, woraus -- im Normalfall und in idealer Konsequenz -- auch noch die geistigsten, weitumspannendsten Aufarbeitungen sich ergeben, bekommt er, der Leibentsprungene, nun neuerdings, auf neue Weise, doch wieder Realboden unter die Füße: Sachlichkeit ist das gloriose menschliche Ziel, das dem Narzißmus endlich im Dienst von Forschung oder Fortschritt, Kunst oder Kultur, als verwandelter Eros zuwinkt wie aus Träumen der Kindheit. Wo er in kindischen Träumen stecken blieb, wo sein großer Sprung zu kurz ausfiel, da entgleist er auch an sich selbst ins Pathologische, Bodenlose.

III.

Was bedeutet nun im Grunde dieser Überschätzungsdrang, der das Objekt aus seiner Einzelheit und Wirklichkeit ins symbolisch Gewertete und Gültige rückt, und der, im Parallelvorgang dazu, den narzißtischen Urtrieb sich in Sublimationen hinaufarbeiten läßt? Beides beruht wohl darauf, daß der bewußtgewordene Mensch sich, je länger je mehr, genötigt sieht, mit seinen infantilen Identifikationsmethoden stets indirekter zu verfahren, d. h. also: sich ihre Undurchführbarkeit stets gleichnishafter zu verhehlen. Das ermöglicht er durch Wertübersteigerung des stellvertretenden Stücks: im _Wertüberschuß_ wird es gleichsam wieder zum Inbegriff selber, ersetzt diesen im Geist. Der narzißtische Libidobetrag, der damit darin stecken bleibt, besticht erfolgreich das der Realität immer angepaßtere Urteil, schließt mit diesem einen Vermittlungspakt, wonach recht eigentlich »Wert« symbolisch für Inbegriff, für »Ein und Alles« steht. Wertproblem überhaupt ist immer und jedesmal Libidoproblem: lediglich durch Anleihe beim libidinösen Zustand enthebt irgendwas sich der Begrenztheit, Aufeinanderbezogenheit des Übrigen. _Alles_ Werten strebt dem Überschätzen entgegen und hinweg aus der Relativität des Einzelngeltenden: es langt, verlangt unabwendbar nach Überzeugtsein durch Glauben (jenem Glauben, bei dem »kein Ding unmöglich« ist, sogar nicht die Wiederanknüpfung infantilsten Urtraums an sachlichste Welterfahrung; mag auch dabei unser sich sublimierender Narzißmus, dieser idealisierende Streber, uns dabei einigermaßen ähnlich werden lassen ewigen Toggenburgern, die ihren Liebesgegenstand um so reichlicher anhimmeln, als sich ihre reale Vermählung mit ihm unvollziehbarer erweist). Mit wie vielen Beweisen und Begründungen wir auch vorzugehen pflegen, nie gelingt darin Überzeugendes ohne heimlich-persönlichsten Anschluß an die narzißtische Forderung in uns; und wiederum: ist sie genehmigt, dann gelänge es keiner Gegenmacht, uns um-zuüberzeugen: versicherten wir noch so bescheiden, es ergäbe sich dadurch wohl nur eine subjektiv-gültige Bewertung, wir wissen sie trotzdem als end- und allgültig, so gewiß unser Narzißmus selbst nichts weiter ist, als das im Gefühlserlebnis noch dunkel festgehaltene Wissen _um unser Subjektivstes als unsere objektive Anschlußstelle_. Von aller Metaphysik, sofern sie das »Sein« mit »Gott« als absolutem Wertprinzip in Übereinstimmung zu bringen trachtet, gilt darum, daß sie nicht nur in ihrer Denkungsweise narzißtisch mitbedingt, sondern an sich das philosophisch aufgearbeitete Abbild des Bundes von Narzißmus und Sachlichkeit ist. Am unmittelbarsten vielleicht tritt dieser doppelte Sachverhalt hervor in der Frage nach dem _Lebenswert_, der nur durch ihn, erst durch ihn, zur Frage _wird_, indem es hier um den Narzißmuswert selber geht, ob auch das Urteil darüber sich ergehen mag wie über ein sachlich gegenüberstellbares Objekt. Im Lebensrausch als solchem -- wovon ja dem Gesunden hilfreich was in Blut und Hirn kreist -- also im narzißtisch hinter allem weiterbeharrenden Rausch, behält ewig der Optimist recht; bei Absehen von dieser innern »unsachlichen« Voraussetzung der Pessimist, d. h. der libidolos, »lieblos« Urteilende, nur eben unrecht hinsichtlich des Lebensträgers, des allein und eigentlich Lebendigen! Wo das Narzißtische im Menschen zu stark übergreift, da bringt seine Allzu-Zuversichtlichkeit trotz ihrer lebensweckenden Kräfte ihn in peinlichen Anprall an die Außenrealität; wo es dagegen zu geschwächt dem realgerichteten Urteil unterliegt, da bringen selbst dessen beste, glücklichste Erfolge keinen wirklichen Frohmut zustande. Darum gleicht sich dem sogenannten Normalen das Dasein ungefähr aus zwischen diesen beiden Richtungen, die gleichsam andeutungsweise, innerhalb der Normalität, etwas vom »Manischen« und etwas vom »Melancholischen« enthalten; auch normalerweise schon übertreibt sich der Tatbestand beidemale fälschend -- und sagt damit dennoch mehr aus, als die gemäßigtesten Zustände tun, wenn sie sich _sehr_ weit von »Haß wie Liebe« entfernen: dermaßen _ist_ »Leben« total nur in seinen Überschätzungen nach beiden Seiten, in seinen zu absoluten Wertabschätzungen, in etwas über alles Stückhafte hinaus, _wahrhaft_, als »Leben« vorhanden.

Aber das narzißtisch bedingte Werten wird erst Problem, wird auch erst Leistung, recht eigentlich da, wo »wertvoll« und »libidobesetzt«, nicht so unmittelbar in eins fallen wie in der Frage nach dem Lebenswert selber: wo, statt dessen, die Wertgebung voraussetzt, daß, um sie zu vollziehen, wenigstens das Infantilste der Stellungnahme dazu aufgegeben, umgestellt sei. Mit anderen Worten: wo der symbolisierende Idealisierungsakt am Objekt schon begleitet ist vom sublimierend aufarbeitenden Akt am Trieb selber (scharf zu unterscheidende Vorgänge, die zu verwechseln _Freud_ mit Recht gewarnt hat). Es ist außerordentlich

interessant, daß vom Narzißmus her nicht nur des Objekts, sondern auch des Subjekts Aufstieg ins immer »wertvoller« Aufgearbeitete möglich ist, was _Freuds_ Wort vom Narzißmus als »Keimpunkt des Idealbildens« schon früh (»Z. E. d. Narz.«) festlegte. Dieser Punkt wird wesentlich, sobald unser Selbstbildnis infolge von Realerfahrungen daran, uns zu enttäuschen beginnt: »Unserm Ideal-Ich gilt nun die Selbstliebe, welche in der Kindheit das wirkliche Ich genoß« (_Freud_, ebenda). Weil hiefür aber auf die Dauer unsere infantile Wunschpraktik nicht ausreicht, nachdem das Weltgegenüber immer sachlichere Maßstäbe an uns legt, so entsteht damit eine Nötigung zu gewissen Rangordnungen in uns, zu Stufungen, Gliederungen auch in unserer Triebwelt. Unser Ebenbild, hineingewünscht ins Ideale, wirkt mit dessen Dimensionen auf uns zurück, manche Züge unterstreichend, andere ausradierend; noch fühlen wir uns schön und groß, ja erst recht groß, aber doch nur, sofern wir uns auch, in den abweichenden Zügen, auch klein oder zu häßlich finden, uns mißschätzen _können_, angesichts des Idealbildes, das wir sind und doch nicht in all und jedem sind. Diese Rückwirkung auf uns, vom narzißtischen Geformten nun ideal, religiös, ethisch oder wie immer, soll man ja nicht gering anschlagen. Es bleibt wesentlich selbst nach Abzug dessen, was bei seiner Bildung von fremden und Außenfaktoren in Betracht kam: einmal den Geboten und Verboten unserer Erzieher, unserer Umwelt, dem feineren oder gröberen Drill; sodann jenes Quantums Objektlibido(9), die uns an die pflegenden und bevormundenden Personen bindet und sie selbst zu nachahmenswertesten Symbolen aller Idealwerte umschafft. Dennoch sind wir bei alledem auch von uns aufs Stärkste beteiligt: wie der Narzißmus innerhalb der Objektlibido das Personelle symbolisch hochzutreiben weiß, wie er sich in immer sachlich weiterfassenden, geisthaftern, abstraktern Zusammenhängen noch durchsetzt, so kommt er auch von sich aus zu letzter Wertautonomie. Sagt ihm am frühesten sein Gefühl, heiß wünschend: »Leben schon gleich Wert!« so vollendet sich das reifste in einem _fordernden_: »Nur Wert allein wahrhaft Leben«, und auch noch diese absolut sich gebärdende, über das Sein gesetzte Wert-Überwertung (die doch um des Seins halber überhaupt erst anhob), dieses Ethische in Reinkultur, auch das ist noch als Höchstleistung unseres Narzißmus zu buchen.

(9) Vortrefflich prägt den Unterschied zwischen Drill und Liebesgesinnung eine (mir gesprächsweise in dieser Form bekannt gewordene) Bemerkung I. _Marzinowskis_: Im einen Fall sucht man Heimlichkeit über eine Verfehlung zu wahren, den Strafakt zu umgehen, als sei sie damit wie unbegangen, im anderen Fall ersehnt man im Gegenteil Beichte, Bekenntnis, auf die Knie sich zu werfen, an die Brust dessen, für den man _liebenswert_ sein will. -- Weniger einverstanden bin ich, wenn _Marzinowski_ in: »Die erotischen Quellen des Minderwertigkeitsgefühls« (Zeitschr. f. Sexualw. IV) ohneweiters volle Reife darin sieht, über das Verlangen nach Gegenliebe, zur Liebesautonomie: »wenn ich dich liebe, was gehts dich an!« zu kommen. Zwar stimmt dies zu den sittlichen Anforderungen bestechend, klingt prächtig selbstlos, redet aber recht oft die Sprache unseres Narzißmus, der noch _gar nicht bis zur vollen Objektliebe gelangte_. Man denkt sich unter narzißtisch Veranlagten zu ausschließlich von Gegenliebe Abhängige (was weit mehr von den bewußter Ich-Eitlen oder aber Narzißmus-Schwachen gilt) anstatt Selbstgenügsame, _weil_ unbewußte Allteilhaber, die auch im Objektlibidinösen nur sehr lose an den Äußerungen vom Objekt her hängen. Bedrängt durch narzißtisches Zuviel, kann ihnen höchst egoistisch »Geben seliger denn Nehmen werden«, d. h. sie dankbarer stimmen für eines Menschen Gewalt, Liebe in ihnen zu wecken, als für seine Gegenliebe, die sie leicht beschämt und neu bedrängt.

Mir erscheint dieser Umstand um so bedeutsamer, als er klarlegt, von wie tief her psychoanalytische Einsicht in die ethischen Unter- und Beweggründe dringt: _Freuds_ Ausspruch vom »narzißtischen Keimpunkt des Idealbildens« rückt ebenso weit ab von metaphysischen Notbehelfen bei Betrachtung psychologischer Tatbestände, wie von jener rationalistischen Einstellung, die überall auf Außeneinflüsse zurückgeht (Nutzen oder Zwang unter nachfolgender Sanktion). Mit _Freud_ reicht die Frage so tief, als der Mensch Menschlichem zu folgen imstande ist: ins Ursprünglichste seiner selbst, dorthin, wo er seiner selbst bewußt wurde und diese Vereinzelung wiederzuergänzen sucht, noch entgegen der eigenen Triebgewalt in Gehorsam oder Liebe, um auf solchem Umweg das Urerlebnis der Allteilhaftigkeit wiedererneuen zu können. Würde das immer schärfer unterschiedenere Ich sich überrennen lassen vom Durcheinanderlaufen der Triebe, so bliebe es auf ein gewaltsames Infantilisieren beschränkt, dem die Außenwelt verloren geht, ohne daß der Urzustand des ihrer noch unbewußten Kindes wiederherstellbar wäre. Freilich ist ja die Ineins-Setzung unserer selbst mit Höchstwerten einerseits ebenfalls eine phantasierte Wirklichkeit, ob wir ihr noch so sehr nachstreben: anderseits aber verbürgt gerade dies Unbedingte daran, wie ganz aus unserm Wesen gebürtig sein muß, was wir mit so großer Gebärde gutheißen. Und in der Tat: wir sind es ja, die sich selbst enttäuschen oder mißfallen, der Gemaßregelte mit dem von seinem Idealwert ganz Benommenen bleiben untrennbar eins in uns, deshalb der narzißtische Liebesquell unentleert (weshalb auch neurotisch der an sich schier Verzweifelnde und der sich nahezu gottgleich Wähnende so verblüffend dicht beieinander stehen). Insofern bildet alle echte Ethik, alle ethische Autonomie, zweifellos ein Kompromiß zwischen Befehl und Begehr, während sie gerade das am prinzipiellsten zu vermeiden sucht: das Begehrte macht sie zwar unerreichlich, durch die Idealstrenge des geforderten Wertes, dafür aber bezieht sie das Befohlene tief ein in den Urtraum allesumfassenden, allesuntergründenden Seins. Dieser Kompromißcharakter verrät sich deutlich auch noch an den starrsten Wertsetzungen -- ja gerade an denen -- den

unterirdischen Zusammenhängen von Gesolltem und Gewünschtem, oder, anders benamst: von Ethik und Religion. Kann keine Religion ein irgendwie ethisch gültiges Moment entbehren (d. h.: daß das Kind zum Vater _aufblicke_), so ebenso gewißlich keine ethische Selbstbezwingung ein Moment der Mutterwärme, die sie darüber hinaus umfängt. Alles, was wir »sublimieren« nennen, beruht einfach auf dieser _Möglichkeit, auch noch Abstraktestem, Unpersönlichstem gegenüber etwas wahren zu können, von der letzten Intimität libidinösen Verhaltens_; nichts als dies ermöglicht den Vorgang, wobei: »die sexuelle Energie -- ganz oder zum großen Teil -- von der sexuellen Verwendung abgelenkt und anderen Zwecken zugeführt wird« (_Freud_, Drei Abh. z. Sexth.). Im religiösen Erlebnis, im »fromm« gerichteten Menschen, schießt früheste, elterngebundene Objektlibido in die narzißtische Strömung mit hinein, und schafft damit eine rechte Glanzleistung des Narzißmus: indem nun beide gemeinsam münden im Gotteswert, als dem zugleich Allesbeherrschenden und Allerintimsten. Was dem Objekt der Libido sonst so übel bekam: das Sichverflüchtigen des Personellen in immer stellvertretendere Symbolik, eben das bringt es am Gotteswert zum Meisterstück, nämlich dermaßen zum Symbol aller Liebessymbole, daß Gott sich daran verpersönlicht(10).

(10) So sehr freilich, daß die Objektidealisierung sogar die Triebsublimierung lähmen kann, und der Gott mehr Entzücken bewirkt als Moral. Übrigens ist es massiv und richtig Gläubigen auch meistens nur selbstverständlich, wenn etwa im Jenseits neben hochsublimierten Glückssorten auch die infantilsten Wünsche sich drastisch durchsetzen -- Askese gilt nur dem Hineingelangen. Erst dem außerhalb solcher Gläubigkeit Stehenden erscheint das nicht folgerichtig, beleidigt seine moralische Logik; und doch lediglich, weil _sein_ erhöhtes, »frommes« Verhalten den stofflichen (Kinder-) Himmel und zugehörigen Personengott, von sich aus, in sich selber, wertend ersetzen muß. Ihm geschieht es deshalb leicht, sich selbst gegenüber weniger ehrlich zu bleiben, und trotz seiner nüchternern sachlichern Einsicht, den narzißtischen Grund und Boden zu verleugnen (den der naive Glaubenshimmel ruhig mit überwölbt), weil er auf seiner obersten irdischen Kippe balancieren muß.

So muß denn das, was zuinnerst des Religiösen wirksam ist -- die Richtung auf ein vertrauensvoll idealisierendes Narzißtisches -- auch den von üblichen Glaubensvorstellungen Gelösten in seinen Sublimationsbestrebungen orientieren, sollen sie ihn nicht in eine Entfremdung zu sich selber geraten lassen. Soll er nicht, dem ihm Wertvollsten hingegeben, es nicht zugleich hoch über ihn hinwegfliegen sehen, ihn nur gerade so weit mit emporreißend, daß er beschämt und entrüstet auf sein flügellahmes Selbst heruntersieht, kurz, daß er statt des beabsichtigten Fluges in Gewissensängste, Schuldgefühle niedersinkt. In ernsthaftester Weise ist _Freuds_ Warnung zu beachten: sich über gegebenes Vermögen an Sublimationen zu »übernehmen«, heiße nicht Vollkommenheit, sondern Neurose vorbereiten. Aber wieder stoßen wir dabei darauf, wie tief und nüchtern _Freud_ sich psychoanalytisch die Ethikprobleme auch hinsichtlich des Schuldbewußtseins erschließt: wie -- wiederum sowohl abseits von metaphysisch als auch von äußerlich (utilitaristisch) vorgenommenen Lösungen -- die Frage sich ihm dahin beantwortet, daß unser narzißtischer Größenwahnrest auch noch dem ethischen Ehrgeiz, dem Aufwärts- und Vorwärtstreiben des real angepaßten Ich, zugrundeliegt, wobei dann am Wege verachtet zurückbleibt, was der anstrengenden Gangart nicht gleich folgen kann. Bis der Mensch »sich« nur noch von demjenigen aus ansieht, was er allein als Sein wertet, ohne es doch _sein_ zu können, und deshalb seine eigene Beschaffenheit zu verdrängen, zu verleugnen suchen muß, ohne von ihr doch frei zu werden. Verhältnismäßig harmlos erweist solcher Vorgang sich noch beim Strafe befürchtenden »Drill«, ja sogar noch beim Gehorsam aus objektbesetzender Liebe, die sich nicht genug tat: rührt er jedoch bis an den narzißtischen Urgrund der ethischen Phänomene, dann ist Schuldbewußtsein, Reue bereits nur noch Name für Erkrankung. Darum sind wohl alle Neurosen immer auch Schuldneurosen, und immer unter dem Kennzeichen, daß der Mensch aus der instinktsicheren Gesundheit seiner Selbstachtung sich hinausgedrängt fühlt, trotzdem er als Neurotiker gar nicht der Typus des »Begehrenden«, sondern der des empfindlich reagierenden Gewissens zu sein pflegt, und eben deshalb die rumorenden Wünsche überängstlich hinter Schloß und Riegel hält. Eine Vertiefung dieses Zwiespalts bis zum Bruch ist es, wenn im Gegensatz dazu der Psychot das Gewissen außer Spiel gesetzt sieht, triebhemmungslos wird, und wohl nur da und nur dann bloßer Phantasieverbrecher bleibt, sofern er schon zu negativistisch von der Realwelt abgekehrt steht um handelnd in sie einzugreifen. Weshalb ja auch das neurotische Pathos in ihm zu ironisierendem Tonfall umschlagen kann, worin sein Ich, gleichsam schon unbeteiligter, machtloser Zuschauer, noch seine Kritik zum besten gibt, nachdem es seinerseits dem Ausschluß, der Verdrängung verfiel, sich desorganisierte und dadurch an Stelle der ihm gegenübergesetzten Realwelt die Technik der primitivsten narzißtischen Wunschproduktion in Wahnbildern am Werk sehen muß. (Traumtechnik des Gesunden.)

Ich gerate auf diese scheinbare Abschweifung aber deshalb, weil mir vorkommen will, als gäbe es ein Analogon für »neurotisch« und »psychotisch« auf dem Gebiet der Ethik für den Normalzustand. Nämlich außer Schuldgefühlen, bezogen auf das Ich, seine Mängel und Taten, auch noch ein ähnliches Enttäuschungsgefühl an Leben und Welt, wobei wir uns aber mitschuldig fühlen, dem wir also nicht pharisäisch oder bettelnd als etwas anderes gegenüberstehen, sondern wobei wir _verletzt sind_ an einer _narzißtisch überlebenden Urverbundenheit_. Natürlich drückt dies das Infantilere aus im Vergleich zum ichgerichteten Gewissen,

das ums eigene Spezialseelenheil Sorge trägt, es kann aber daneben weiterbeharren. Ich entsinne mich aus meiner Kindheit und von noch später her eines grotesken Herzwehs über enttäuschende Mängel anderer, die mich weit mehr »ethisch« grämten als die eigenen Mängel: denn was konnte es nützen, vollkommener zu werden, wenn es nicht um das Ganze der Welt, und nur darum auch mich mit einbegriffen, derartig vollkommen bestellt war? Entzücken und Dankbarkeit riß mich hin, wo etwas solchen Glauben zu bewahrheiten schien, und enthob mich damit betrüblich rasch jeder persönlichen Gewissenssorge, welche Figur denn ich mitten drin machen würde. So viel Kindisches das auch ausdrückt, so liegt doch fraglos eine Spur Ironie in dem Umstand, daß der Andere, Gewissenhafte, der von seiner Selbstsucht am ethischesten loskommen Wollende, am eifrigsten und ständigsten mit sich beschäftigt bleiben muß, sich weder in Herzweh noch Herzenslust völlig vergessen darf. Deshalb sind auch noch bei der ethischen Einstellung zweierlei Verhaltungsweisen unterscheidbar: die eine vorwiegend von den Wertanforderungen des Ichbewußtseins aus und das Ich strebend im Mittelpunkt haltend, die andere von den alten Identifizierungskünsten des Narzißmus aus, aber gleichfalls aufgearbeitet in ethisch gerichtete Wunschträume. Dies jedoch dient aus einem bestimmten Grunde einer wichtigen Seite der Sache: denn offenbar entnimmt ja alle Ethik ihren Hauptcharakter, eben ihre Unbedingtheit, Absolutheit, Allgültigkeit dem narzißtischen Urzuschuß, der so sehr für alles Übermäßige zu haben ist, und »ethisiert« uns erst an diesem fragwürdigen Material. So kommt es zu Wechselwirkungen von beiden, deren Paradoxie, näher betrachtet, schwer überboten werden könnte. Gibt es doch keine Askese oder Gesetzesstrenge, kein endgültiges Verachten des Realen, das nicht nach dem narzißtischen Helfershelfer dabei riefe, erst er, der begehrliche, wunschdreiste, lehrt uns auch das: »geh an der Welt vorüber, es ist nichts.« Und anderseits: eben die absolut gerichtete Ethik bedarf der ganzen Fülle des Möglichen und Wirklichen, muß allen Sonderfällen des Geschehens gerecht werden, alle Aufeinanderbezogenheiten berücksichtigen, denn um der Menschen und ihres Heils- und Glückstraums willen ist sie da, vom kindlichselbstischen bis sublimen Egoismus des Himmelsstürmers und Gottsuchers. Dies Wesen der ethischen Praktik, die ihre Unbedingtheit narzißtisch bedingt, sowie wiederum diese strenge, hoheitsvolle Wertmiene des ethisch verwendeten Narzißmus, ergeben einen derartigen Knäuel von Widersprüchen von Fall zu Fall, daß man ruhig behaupten kann: nur rein schematisch verfuhr, wer jemals, über den Einzelfall hinaus, diese lebenstrotzende Wirrnis in glattem Faden aufwickelte.

Nun kann ich aber dies Thema nicht abbrechen, ohne eines hinzugesetzt zu haben: nämlich wie sehr eben dies meine ganze Hochachtung und Ehrfurcht vor dem Phänomen des »Ethischen« im Menschen geradezu ausmacht. Denn erst dadurch erhebt es sich zu den schöpferischen Betätigungen, ungeachtet es auf Gesetz und Regel und Soll ausgeht. Ja durch die Reibung innerhalb solchen Widerspruchs -- durch die Unbedingtheit, die dennoch sich lediglich durchzusetzen vermag »von Fall zu Fall«, d. h. im lebendigen Vollzuge allein -- wird es _die_ schöpferische Tätigkeit par excellence, vollziehend das, was »nie und nirgends sich begeben«. Ethik: sich erst voll ausweisend im vorschriftsmäßig am wenigsten zu Schlichtenden, im Durcheinandersichkreuzen der Gebote und Verbote, erst damit wahrhaft autonom das Gültige zum Erlebnis hebend. Begreiflicherweise bleibt Vorschrift, Gesetz, das prinzipiell betonteste da, wo heimliche Wunschzutaten abgewehrt werden sollen, trotzdem aber ist in irgend einem Sinne »Ethik« auch immer zugleich das Unvorgeschriebene, schlechthin Gedichtete, d. h. trägt in all ihrem Tateifer wie ihrem Werk zugleich das Stigma des Verträumten, woraus Dichtertat sich zum Werke formt. Nur, leistet der Dichter »träumend«, so handelt in die Praxis hinein der ethisch gerichtete Mensch: wagt seinen Traum an Realität, Drangsal, Erfahrung, an den Anprall aller Zufälle und Wirrnisse. Darin liegt die Würde des Bruchstückhaften, nie Vollendeten, was ihm allenfalls gelingt, verglichen mit künstlerischer Werkrundung, deren Abseits er nicht ertrüge, die er sprengt, um sie nochmals und nochmals aufs Spiel zu setzen. Ethik ist _Wagnis_, das äußerste Wagestück des Narzißmus, seine sublimste Keckheit, sein vorbildliches Abenteuer, der Ausbruch seines letzten Mutes und Übermutes ans Leben.

IV.

Bei dem, was Kunst genannt wird, künstlerisches Schaffen, oder sagen wir allgemeiner: poetisch anstatt praktisch gerichtete Betätigung, braucht man die narzißtische Kinderstube nicht erst an Restbeständen daraus aufzuspüren wie bei Objektbesetzungen oder Wertsetzungen: unmittelbar nimmt es immer wieder von dorther den Ausgang, auf eigenem Pfad, verfährt bis in alle letzten Ziele, narzißtisch »wertend« und »besetzend«. Die gleiche Methode stünde uns allen auch lebenslänglich, jeglichen Augenblick und bei jedem Eindruck zu Gebote, würden wir uns durch unsere logisch-praktische Anpassung an die Ich- und Realwelt nicht ihrer so grundsätzlich entledigen, daß wir meistens nur erinnernd dorthin zurückkönnen, wo Innen-Erlebnis und Außen-Vorfall noch ungetrennt für dasselbe Geschehen stehen. Für dies Erinnern gilt darum etwas anderes als fürs Gedächtnis, wovon _Freud_ vermerkt, es scheine: »ganz am Bewußtsein zu hängen, und ist scharf von den Erinnerungsspuren zu scheiden, in denen sich die Erlebnisse des Unbewußten fixieren« (Fußnote aus »Das Unbewußte«); denn diese sind im Bereich wirkender »Sachvorstellungen«, nicht davon abgezogener »Wortvorstellungen« (_Freud_) zu denken, dieser bloßen Verständigungskonventionen, deren wir uns gedächtnismäßig bemächtigen. Äußerste Exaktheit, Triumph besten Gedächtnisses,

kann so in umgekehrtes Verhältnis geraten zu Erinnerungsklarheit, die, in lebendigem Zusammenhang der Eindrücke wirksam, gleichsam nur an Leben entlang sich ins Bewußtsein hebt: Gedächtnis _haben_ wir, Erinnerung _sind_ wir. Das allein ist der Grund des unkünstlerischen bloßen »Abbildes«, und gilt darum weder für Kinder noch für Primitive, sofern sie Reales noch phantastisch, Phantasiertes als real nehmen können. Am schönsten kennzeichnet die vorgetäuschte Bewegung des Films den Gegensatz zu Erinnerungsbewegtem: man könnte sich sogar denken, daß derartige, dem Gedächtnis allzu tadellos nachhelfende Vergegenwärtigungen von Vergangenem, Erinnerung auf tödliche Weise beeinflussen würden, sie desorganisierend, zersetzend in ihrer grundliegenden Totalität. Gewissermaßen ist ja Erinnerung ein nie nur »praktischer«, immer auch schon »poetischer« Vollzug: sie ist damit sozusagen das einem jeden von uns aufbewahrte Stück Dichtertum, Ergebnis zugleich Distanz schaffender, bewußte Überschau ermöglichender Vergangenheit, und ewig-erneuter Aktualität und Affektivität, auch wo sich beides nicht so formend zusammentut wie im Werk des Poeten. Poesie ist Weiterführung dessen, was das Kind noch lebte und was es dem Heranwachsenden opfern mußte für seine Daseinspraxis: Poesie ist perfektgewordene Erinnerung.

Nun gibt es nichts, was tiefer in Kindheitseindrücke zurückbrächte, als aufgehobene Verdrängungen und nichts strebt von sich aus heftiger nach solcher erinnernder Befreiung als das kindliche, noch so ganz von Geboten und Verboten der Erwachsenen umstellte Leben. An die infantilen Verdrängungen schließen die spätern sich an -- bilden damit den »Schatz von Erinnerungsspuren, welche der bewußten Verfügung entzogen sind, und die nun mit assoziativer Bindung das an sich ziehen, worauf vom Bewußtsein her die abstoßenden Kräfte der Verdrängung wirken. Ohne infantile Amnesie, kann man sagen, gäbe es keine hysterische Amnesie« (_Freud_, Drei Abh. z. Sexth.). Schon früh, in seiner Studie über »die Dichter und das Phantasieren«, faßte _Freud_ daher Kunst auf als Spezifikum gegen Verdrängungsgifte, und welche Erweiterungen seine Arbeit über den Gegenstand auch seither durch ihn erfuhr: dieser Hauptpunkt bleibt derselbe, wenn er auch den Unwillen der Künstler erregt infolge meist zu flacher Auslegung. Man achtet nämlich zu häufig nur darauf, daß die Kunst Wunscherfüllungen gewährleistet, die sonst gar nicht oder nur strafbar oder endlich krankhaft sich durchsetzen, man übersieht aber darüber die ganze Tragweite der _Freud_schen Unterscheidung von »bewußtem« und »unbewußtem« Wunschziel. Niemand bedarf weniger der Erfüllung von Personalwünschen wie der Künstler. Niemand bleibt weniger in ihnen stecken, ja niemand kommt von vornherein, eben als Schaffender, von Erfüllungen _her_, statt ihnen nur nachzujagen. Durch zeitweiliges Zurückgenommensein in ursprünglicheren Zusammenschluß dessen, was sich uns sonst nur in Subjekt und Objekt spaltet, ist er seinem Einzelsinn und Privatsein im Schaffen enthobener als sonst irgendwo: ja eben dies allein gestattet und ermöglicht ihm die Aufhebung des Verdrängenden, eben dies erst gibt ja seinen Regungen eine Freiheit wieder, wie wenn sie »ich-gerecht« im Sinn der Bewußtseinszensur wären (vgl. _Freud_: »das Unbewußte wird für diese eine Konstellation ich-gerecht, ohne daß sonst an seiner Verdrängung etwas abgeändert würde. Der Erfolg des Unbewußten ist an dieser Kooperation unverkennbar; die verstärkten Strebungen benehmen sich doch anders als die normalen, sie befähigen zu besonders vollkommener Leistung«). Dafür ist maßgebend, daß nicht auf unser Individual-Ich, wie es sich bewußt auf sich selbst bezieht, dabei zurückgegangen sei, sondern auf jene noch Allen gemeinsame Grundlage, auf Aller Wesenskindheit, wie sich auch der künstlerische Mitgenuß hierauf nur gründen kann(11). Ohne es zu wollen, hat so der Künstler sein Publikum in sich, bei sich, und nur um so mehr, je vollständiger er davon abzusehen pflegt, aufgebraucht vom Schaffensvorgang selber. Wird es -- meines Erachtens -- beim ethischen Verhalten auffallend, wie sehr das Allgemeingültige letztlich sich »ethisch« doch nur durchführen läßt von »Fall zu Fall«, in solchem scheinbaren Selbstwiderspruch gerade seine eigentliche schöpferische Bedeutung erst offenbarend, so überrascht am allerpersönlichsten Erfaßtsein des Künstlers, wie sehr, wie ganz es immer schon das Allgemeine mit umfaßt, um erst daran wirklich, Werk, zu werden. Hier erschließt sich das anscheinend Subjektivste als Anschlußstelle des objektiv Gültigsten. Dazu stimmt die Erfahrung, daß schaffendes Verhalten, je leichter, sieghafter es sich durchsetzt, in desto rücksichtsloseren Gegensatz oft tritt zum, körperlich oder seelisch bestimmten, sonstigen Personalzustand: darin tatsächlich der Leibesfrucht ähnlich, deren Wachstum zu Verlagerungen, Bedrängnissen im übrigen Organismus führt oder Muttergift durch seine Adern kreisen läßt. Nicht selten erwacht der Künstler aus seiner Benommenheit wie aus einer zwangshaften, mit dem Gefühl von Befreiung, nun wieder an Beliebiges denken zu dürfen, sich in personell oder sachlich Wünschbarem ungehindert gehen zu lassen. Wobei er sich dann freilich oft mitverwandelt fühlt durch das Vorhergehende: als habe vieles sich erledigt, was vorher am stärksten beschäftigte, als seien Umwertungen eingetreten, die zuvor Unmerkliches neu betonen, Altes verjüngen, Junges vergreisen ließen.

(11) Innerhalb davon dürfte sich zweierlei Schaffensart unterscheiden lassen, je nachdem, wie weit Aufhebung von Verdrängungen vorwiegend in Frage kommt. Diese kann den Vorgang so kampf- und angstvoll einleiten, daß er zunächst Widerstreben statt Freude weckt; Hermann _Bang_ erzählte mir, wie oft er bei Arbeitsausbruch vom Stuhl springe und ans Fenster eile, hoffend, etwas Ablenkendes draußen möge ihn daraus erlösen. Glücksgefühl stellt sich hier erst als abgeworfener Verdrängungsdruck, als Kraftersparnis ein (analog den _Freud_schen Ausführungen über die Witztechnik). Positiver, bedingungsloser wirkt das Glück, wo es sich weniger um Verdrängungskampf handelt, als um unwillkürlich an uns sich vollziehende Erweiterungen, Ausweitungen

unseres Wesens: um Beschenktwerden mit etwas, was nicht Wunsch oder Versagung in unserm Dasein gewesen war, sondern was praktisch uns gar nicht »lag«, d. h. unserer persönlichen Struktur nicht entsprach, »verdrängt« also schon wurde mit der andrängenden Fülle unverwendbarer Ureindrücke. Im tiefen Zurückreichen bis ins Infantilste kann uns gerade daraus zufallen, was sich damit »werkhaft« erledigt: Ergänzung, Ahnung, die hoch um uns herum reicht, uns nun erst einschließend ins Menschentum Aller. Der identifizierende Narzißmus, von produktiver Phantasie aus seiner Infantilität emporgerissen, beteiligt sich berauscht daran, ohne daß unsere persönliche Ichhaltung praktisch verändert würde.

Interessant studiert es sich am Geschlechtlichen: wie durchaus es mit seinen Hauptkomplexen im Schaffensmittelpunkt stehen bleibt, an der Konzeption zutiefst damit beteiligt, und dennoch nur soweit, als es aufgearbeitet wurde ins -- gleichsam -- Privatwollustfreie, d. h. als der Zentralpunkt sich total aus dem personalen Umkreis verschob. Wo dies auch nur im geringsten mißlang, bedeutet die persönlich erstrebte Phantasiewunscherfüllung sofort das Versagen im Schöpferischen. Denn wohl bedarf der Künstler der Regression bis ins Infantilste und damit am leiblichsten Beeinflußte, aber auch nur er verhält sich auch hiezu »schaffend«. Der Anteil des Eros an Geistschöpferischem -- wie stark der Hinweis darauf auch _Freud_ verübelt wird -- gehört wohl zu den ältesten Erkenntnissen, und im Grunde sollte doch ebenfalls selbstverständlich sein, daß dafür nur _die_ Anteile daran in Betracht kommen, die wir nicht geradenwegs zum Normalziel abführen, sondern diesem Ziel entgegen, also infantil erhalten. Aber schöpferisch bedeutsam werden sie wiederum erst unter Beihilfe von Verdrängung: nur daß sie sich, anstatt aufs »Desinfantilisieren« und »Genitalisieren«, auf ein Entleiblichen des ursprünglich kindlich Polymorphen bezieht. Man möchte sagen: künstlerisches Schaffen _enthülst_ gewissermaßen aus dem Leibhaften den fruchtbaren Kern, der sich im Werk dann allseitig auswächst. Mit E. _Jones'_ Wort (aus der vorzüglichen Studie: »Die Empfängnis Mariae durch das Ohr«, Jahrbuch IV) gesagt, liegt im Künstlerischen: »die Reaktion gegen die Geschlechtlichkeit dem Streben, und ihre Sublimierung den Formen, die das Streben annimmt, zugrunde«(12). Daß Begehr und Reaktion, beide, hier gewaltig vertreten sein müssen(13), darauf gründet _Schopenhauer_ sein bekanntes Experiment: sexueller Reizung nachzugeben um dann, jählings, vom Punkt hoher Steigerung, abzubiegen in Geistesarbeit. Man wäre versucht zu glauben, ähnliche Experimente müßten sich bestätigen nicht nur bezüglich speziell-sexualer Mitwirkung, sondern aller Triebhaftigkeit, z. B. auch von als »böse« gebrandmarkten Regungen, denen wir ja nur infantil-sorglos noch ohneweiters nachgaben. Das noch amoralische Begehren, so dicht bei seiner Umstülpung vom narzißtisch Ununterschiedenen ins kraß selbstisch Verengte, mag bei diesem Übergang Möglichkeiten in sich enthalten, die dem Menschen nicht in der Praxis, nur in schaffender Phantasie, ganz aufgehen. Ist doch »Sexuales« wie »Böses« in diesem Sinn allein, aber darin tatsächlich, dem Schaffenden vermehrt zu eigen: wenn _Goethe_ versichert, er wisse »von keinem Verbrechen, das er nicht auch begangen haben könnte«, so kennzeichnet das nicht den individuellsten, sondern typischesten, den noch infantil-alles enthaltenden Menschen, den, auf formkünstlerischem Wege zielmächtigsten, aber auch den schlechthin riskiertesten. (Es handelt sich darum: »zu begreifen, daß die bevorzugten Objekte des Menschen, ihre Ideale, aus denselben Wahrnehmungen und Erlebnissen stammen, wie die von ihnen am meisten verabscheuten, und sich ursprünglich nur durch geringe Modifikationen voneinander unterscheiden«; _Freud_, »Das Unbewußte«.) Entgleist der Mensch aus seinem Schaffenszustand, so sieht er sich infolgedessen furchtbar aufgehängt zwischen Nichts und Nichts: weder geborgen am Werk, noch an der Realwelt, worin er dem Urteil der anderen fragwürdig wurde wie dem eigenen, d. h. wie seinem Privatpersonentum innerhalb praktischer Weltgeltungen. Lassen schon Stockungen, Störungen während der Arbeit Künstler leicht als Neurotiker erscheinen, so gleicht die gefährliche Grundvoraussetzung alles Schaffens sie nahezu psychotischer Verfassung an: indem es sie hinter den Rücken ihres Ich zurückzieht in ihrer eigentlichsten Tätigkeit. Gelegentlich mehrfacher Beobachtungen habe ich mich immer wieder überzeugt, mit welcher Selbstverständlichkeit, bei unvermutetem Absturz aus produktivem Verhalten, ein Zurückfallen in Infantilismen sexueller Art sich einstellen kann (_Freuds_ Bemerkung bewahrheitend: »Das Höchste und das Niederste hängen an der Sexualität überall am innigsten aneinander.« Drei Abh. z. Sexth.). Gerade daran pflegt die Befürchtung sich zu verstärken: daß es sich wohl nicht nur um vorübergehende Unterbrechung handle, sondern um Nachlassen der geistigen Potenz überhaupt. Dies ist aber um so bedauerlicher, als Schaffenszustände oft geradezu derartiger Absetzungen, Aussetzungen _bedürfen_ mögen, solcher Erholungspausen des Bewußtseins, dem heimlich weitergehende Arbeit sich entzieht, etwa wie dem Auge der Säfterückzug in winterlichen Stamm entzogen bleibt, während dessen die Bäume sich umschütten mit aller Melancholie entleerten, entfärbten Laubes. Wir beurteilen uns eben vom Bewußtseinsauge aus, das wir prüfend auf uns richteten seit Überschreiten unserer Infantilgrenze; und dieser beurteilende, verurteilende Blick ist dann am unerbittlichsten, schärfsten, wie auch die Triebe an dieser Grenze hier am stärksten sich stauen und verstärken(14). Es ist deshalb, als ob der Schaffende noch einmal Kindheitsparadies wie Kindheitshölle gleichermaßen zu durchkosten bekäme.

(12) Ich finde eben zwei Verse von Hugo von _Hofmannsthal_, die sowohl die Verdrängungshilfe beim Schaffen, als auch dessen widerspruchsvolle Verknüpfung mit der Leiblichkeit hübsch wiedergeben:

1. »Aus der verschütteten Gruft nur wollt' ich ins Freie mich wühlen, Aber da brach ich dem Licht Bahn und die Höhle erglüht.«

2. »Fürchterlich ist diese Kunst! Ich spinn' aus dem Leib mir den Faden, Und dieser Faden zugleich ist auch mein Weg durch die Luft.«

(13) In seinen »Drei Abh. z. Sexth.« vermerkt _Freud_ die Tatsache, daß man, obwohl dem Schönen das sexuell Reizende praktisch zugerechnet zu werden pflegt, doch niemals die Genitalien selber als schön bezeichnete. Sicherlich erklärt sich daraus, wie ganz die Hochwertigkeit ästhetischer Betrachtungsweise sich nur gegen die Gepflogenheiten der Praxis durchsetzte: auch noch die Enthüllung des Nackten als Poesie bleibt insofern eine Folge des Feigenblattes.

(14) Der verstorbene junge Markus hat gut in einer kleinen Studie (Zentralblatt IV, 11-12 »Die Objektwahl in der Liebe«, p. 598) darauf hingewiesen, wie die _Freud_sche »Latenzzeit« es sei, worin diejenigen Urteile sich in uns festsetzen, die später der Sexualität so autoritativ wie aus anderer Welt gegenübertreten.

Entfremdetsein von unserm Ich ist uns harmlos nur gegeben in unserer allnächtlichen kleinen Psychose, unserem allnächtlichen wundersamen Schaffenszustand, dem Traum, der schon so vielfach primitivem Kunstwerk verglichen wurde. Was den Traum dem Schaffen vor allem anähnelt, ist die ungeheuere Objektivität, womit er seinen Inhalt vor uns hinstellt, auch noch an das scheinbar krauseste Durcheinander verblüffende Kraft überzeugender Formung, Gestaltung, verschwendend. Aber nicht einmal diese selbst enthält, meines Erachtens, das künstlerischeste Moment daran: sondern erst die Traumfähigkeit _so vielem gerecht zu werden unbeeinflußt von unserer persönlichen Stellungnahme dazu_. Man kennt _Lichtenbergs_ ärgerliche Frage, warum, um alles in der Welt, sogar Dichter außerstande seien, fremde Charaktere derartig treffend, wissend, unbestechlich durch eigene Vorurteile zu verlebendigen, wie der Traum es mühelos erzielt. Mir ist das stets als tiefster Beweis dafür erschienen, daß im gesunden, unbeschädigten Narzißmus an sich selber dies übersubjektive Moment wirksam sei, d. h. seine Wunscherfüllungen gar nicht umhin können, aus tiefer Identifikation mit allem herauszuschaffen, weil nur dies seiner unwillkürlichen Tendenz entspricht. Sowohl am manifesten wie latenten Traumtext finden sich Teile dieser Art, die sich über das persönlich Wünschbare hinaussetzen, den Träumer anderen gegenüber zu kurz kommen lassen, und, wenn psychoanalytisch weit genug verfolgt, auf das noch Allumfassende des Narzißtischen führen. Nur daß im Traum der Homer schläft, der das Werken zunutze machen könnte. In Wachträumen dagegen, wo die geistige Überlegenheit nicht schlummert und wo sie auch Beobachtungen des Sachverhalts so erleichtern könnte, fehlt damit auch jene narzißtische Identifikation mit ihrer ungewollt großzügigen Objektivität: Wünsche des Ichs gewinnen Oberhand und zerstören mit ihrer passiven Selbstbespiegelung den aktiven Formdrang(15). Auch im Kunstwerk kann es Punkte geben, daraus Traum oder Wachtraum verräterisch reden: d. h. ungenügende Bewußtseinsarbeit oder aber ungenügende Ichverdrängung -- Punkte, bei denen besonders erfolgreich Analyse ansetzen kann, während das künstlerisch Vollgelungene sich aller Berechenbarkeit entzieht: sozusagen nicht ermöglicht, auf der Linksseite des bunten Mustergewebes dem Verlauf der Fäden und Verknotungen nachzuspüren(16).

(15) Mir hat es sich bisweilen aufgedrängt, daß in Wachträumen sich Übergang vorbereitet zu tätig-produktivem Zustand, wenn der Wunschtext, der meist höchst bewußt zugrundeliegt, mit seinem passiven Realisierungsspiel zur Seite weicht vor einer gewissermaßen formalen Bewältigung seiner Einfälle. _Dieser Übergang selbst_ schert sich dann daran illustrativ zu spiegeln, schafft sich selber gleichsam Sinnbilder, so daß es dabei fast zugeht, wie bei _Silberers_ »funktionalem Phänomen«: nur, anstatt zwischen Wachen und Einschlafen, hier zwischen Wachtraum und Produktion, also nach der anderen Richtung dessen, was uns unserem isolierten Ichbewußtsein enthebt.

(16) Hinsichtlich der Psychoanalyse an lebenden schaffenden Künstlern möchte ich glauben, daß man äußerst vorsichtig und streng zweierlei mögliche Wirkungen auseinanderhalten muß: die künstlerisch befreiende, wodurch Hemmungen, Stockungen in den formentbindenden Sublimationsvorgängen beseitigt werden, und eine unter Umständen gefährdende, insofern sie ans Dunkel rühren kann, worin die Frucht keimt. Ob man sich ganz ans Personale, Außerästhetische, halten kann bei tiefer dringender Psychoanalyse, ist kaum zu beantworten bei unserem geringen Wissen um das Zustandekommen schöpferischer Vorgänge.

So ist denn, ganz abgesehen von der »Begabungsfrage«, auf die beim Künstlertum zurückgegangen sein muß, die _Objektivierungsnötigung_ schon in der narzißtischen Identifikation als alles Schaffens Grundlage gegeben. Der Werkdrang, der Formwille ergibt sich in seiner ganzen Wucht aus dieser noch ungeschiedenen Einheitlichkeit von passiv und aktiv, wovon unsere mittleren, unsere bewußtseinsvermittelteren, abgeleiteteren Zustände so wenig mehr wissen, und was darum auch die Sprache in ein Zweierlei zerzupft (obschon wir noch biologisch »Reizsamkeit« und »Reaktion« als identisches Lebensmerkmal auffassen). Indem nun Schöpfungen der Kunst sich außerhalb des praktischen Daseinsablaufs in ihrer Wirklichkeit durchsetzen müssen,

binden sie ihre Erlebnisweise an die _Wiederholbarkeit_; Form geworden heißt da: in Vorhandenheit, Gegenwart, Sein, beharren durch unabänderliche Festlegung bis ins Letzte und Äußerste, so daß jedem inneren Nachschaffen, jedem Mitgenuß das Ganze sich lebendig darstellt. Kinder, in ihrer Phantasiefrische, wissen am besten um diesen Umstand, wenn sie eifervoll darauf bestehen, Erzähltes absolut gleichlautend wiederzuhören, und jede Änderung daran als »Lüge«, als Angriff auf ein positives Sein, rügen. Diese Formehrfurcht, für die Form noch Inhalt in tieferem Sinn ist und umgekehrt, läßt leicht Kinder künstlerisch begabter erscheinen, als sich später beglaubigt; sie haben eben noch -- wörtlich -- »Spiel«raum dafür innerhalb der praktisch-logischen Realität, die sie noch nicht von allen Seiten zwingend umlagert und »Urgezeugtes« noch nicht an Welt und Ich vorbei, in ganz andere Kategorie verweist. So spielend-selig würde der Künstler sein Werk erleben, handelte es sich nicht darum, nachdem es ihm geschenkt ward, es zu übersetzen wie Träume erst in »sekundärer Bearbeitung« vor dem Entsinken bewahrt werden können. Eben daß es nicht um ein stückweis Werdendes, erst zu Erarbeitendes geht, sondern um Vorhandenheit, davon nur Schleier zu reißen sind, die sich verdichten, plötzlich undurchdringlich werden können, macht die eigentlich aufreibende Anstrengung bei der Arbeit aus, ihre Hast und Angst. Ohne die drei Allzumenschlichkeiten, die mit allem Schöpferischen zusammenhängen: den Kampf gegen dabei zu behebende Verdrängungen, die Gefahr des Entgleisens in infantile Materialität, und endlich diese hastende Überspannung -- wäre es eine »Anweisung zu seligem Leben«, wie sie sonst nichts auf Erden kennt, ein Schwelgen aus dem Vollen, worin Rausch und Frieden sich zur gleichen unerhörten Erfahrung einen. Nicht umsonst pflegt solchen Zeiten, noch ehe das Bewußtsein ihr Nahen gewahr wird, gleich einem Herold, Freude voranzugehen (im Gegensatz zu anderer, von uns mehr oder weniger als begründet gewußter Freude, eine dem Manischen ähnliche, wie auch jähes Vertriebensein daraus eher an pathologische Melancholie gemahnt als an normale Verlust-Trauer)(17). Im Schöpferischen, wenn irgendwo, finden wir die Farben und Bilder, womit sich uns fast Gotthaftes ins Irdische malt. Und wenn der Mensch sich einen Gott als Weltenschöpfer vorstellt, so ist das nicht nur, um die Welt, sondern auch des Gottes -- narzißtische -- Wesenheit zu erklären: mag solcher Welt Böses und Übel in Menge anhaften, der fromme Glaube würde erst zunichte an einem Gott, der nicht wagt Werk, Welt, zu werden.

(17) In »Über Trauer und Melancholie« (S. d. kl. Schr. z. Nl. IV) wirft _Freud_ die Frage auf, warum, trotz gewisser Vergleichbarkeit von Melancholie mit normaler Trauer, von Manie mit Frohsinn, wohl der Melancholie Manie folge, nicht aber der Trauer Frohsinn, sondern nur resignierende Gewöhnung, und ob die _Allmählichkeit_ der Gewöhnung an den Verlust das verursache: »Diese Lösung geht so langsam und schrittweise vor sich, daß mit der Beendigung der Arbeit auch der für sie erforderliche Aufwand zerstreut ist.« Außer solchem ökonomischen Gesichtspunkt kommt vielleicht noch in Betracht, daß, während Normaltrauer auf ihren Einzelfall beschränkt bleibt und eben an dem, was noch übrig bleibt, sich zur Resignation ausgleicht, für Melancholie narzißtisch »alles« hin ist, inbegriffen das eigene, sich selbst vernichtende und entwertende Ich, und ebenso der Umschlag in Manie »alles« wiederherstellt, also nicht an Gräber sich gewöhnt, sondern Auferstehungen feiert. Dies würde aufs Stärkste an die narzißtisch-durchsetzten Zustände des poetisch Schaffenden erinnern.

[Im folgenden werden alle geänderten Textzeilen angeführt, wobei jeweils zuerst die Zeile wie im Original, danach die geänderte Zeile steht.

HERMAPHRODISIE EN URANISME.

VOORDRACHT,

den 5en Juni 1908 te Amsterdam voor de candidaten van de Juridische Faculteit van het A. S. C. gehouden

--DOOR--

Dr. A. ALETRINO,

Priv.-doc. I/d Crim. anthrop. a/d Universiteit te Amsterdam.

F. VAN ROSSEN--AMSTERDAM 1908.

Zeer gewenschte toehoorderessen en toehoorders,

Ik stel er prijs op, vóór ik aan mijn eigenlijk onderwerp begin, U te verzoeken, wel te willen bedenken, dat ik op het standpunt sta, dat niemand, en dus ook ik niet, het recht heeft zich met de geslachtsdaden van anderen te bemoeien of die te veroordeelen, wanneer door deze niet een van de twee personen, tusschen wie de daad geschiedt, of een derde benadeeld wordt en dat ik--en ik weet bij ondervinding, door en na het congres voor crimineele anthropologie in 1901 te Amsterdam gehouden, waar ik een rapport "Sur la situation sociale de l'uraniste" inzond, hoezeer men geneigd is iemand die over dat onderwerp schrijft of spreekt, verkeerde bedoelingen toe te dichten en verkeerde woorden in den mond te leggen--geen propaganda maak voor normale of, zooals men het heeft willen noemen, abnormale geslachtsuitingen, maar dat ik de kwestie alleen uit een humanitair en wetenschappelijk oogpunt bestudeer.

Drie redenen zijn er, waarom ik juist dit onderdeel der natuurwetenschappen heb uitgekozen om hedenavond met U te bespreken, al kan die bespreking--om de groote uitgebreidheid van het onderwerp--niet dan zeer onvolledig zijn en ik mij--om den beperkten tijd, waarover ik kan beschikken--zal moeten bepalen tot het slechts in groote lijnen aangeven der omtrekken en zoovele en belangrijke détails zal moeten laten rusten.

De eerste reden is, dat men er noch op colleges voor juristen, noch op medische colleges, noch op de colleges voor gerechtelijke geneeskunde over spreekt. Is dit, omdat men het onderwerp van te weinig gewicht acht? Of is het uit overmatige kuischheid? Want zoodra er over dit onderwerp wordt gesproken, steekt een, ik zou haast zeggen pathologische, kuischheid haar hoofd op. Als bewijs daarvan diene, dat, toen ik eenige jaren geleden een opstel over het uranisme aan een medisch tijdschrift hier te lande had gezonden, ik het terugontving met een begeleidend schrijven, waarin te lezen stond, "dat de Redactie voor dìt onderwerp geen plaats wilde afstaan". Als een ander bewijs van die kuischheid diene, dat men iemand die over het onderwerp schrijft of spreekt, als iemand betitelt, "die het goed recht van het bestaan van "gruwelen" bepleit". Ik heb het moeten verduren, dat de minister-president Kuyper, eertijds zoowel in een zitting van de Eerste, als in een van de Tweede Kamer, coram populo mijn goeden naam aantastte, om wat ik op bovengenoemd congres had gezegd[1], en dat later een onbekend atoom, een zekere heer v. d. Biesen, die mij tot professor verhief, hem in een zitting van de Eerste Kamer die woorden nabazelde![2]

De tweede reden is, dat in den laatsten tijd het vraagstuk meer op den voorgrond is geschoven. Ik behoef U slechts te wijzen op het geval, door de onbescheidenheid van sommige dagbladen met naam en toenaam aan het licht gebracht, van een beeldhouwster, die hier in Amsterdam werkte en die plotseling van sexe is veranderd en nu als beeldhouwer in het buitenland vertoeft; ik behoef U slechts het proces-Moltke contra Harden te noemen, dat kort geleden in Berlijn is afgespeeld; ik wil U wijzen op de twee rechtzaken hier in de laatste jaren behandeld, waarbij de aangeklaagde beschuldigd werd onzedelijke homosexueele handelingen met minderjarigen te hebben gepleegd.

De derde reden is, dat ik het van ongemeen groot gewicht voor U vind, dat Gij van het onderwerp op de hoogte zijt. Als rechter kan het U worden opgedragen in zulk een geval te oordeelen. Gij kunt als verdediger worden aangewezen om een beklaagde in zulk een geval bij te staan, evengoed als de geneesheer kan worden geroepen om in zulk een geval hulp en raad te geven. Wanneer ik bedenk in welke moeilijkheid ik zelf heb verkeerd, toen--kort nadat ik als geneesheer gevestigd was--de zoon van een mijner patienten tot mij kwam om raad en hulp en ik geheel onvoorbereid wat het onderwerp betreft, gedwongen was hem te helpen--hij is dan ook de oorzaak geweest, dat ik met de studie er van ben begonnen en dat ik mij er in heb verdiept--dan voel ik het mijn plicht U, als het maar eenigszins kan, voor deze moeilijkheden te vrijwaren en U eenig inzicht in het onderwerp te geven, opdat Gij er misschien later gemakkelijker verder in kunt doordringen.

* * * * *

Men heeft altijd gemeend--en zelfs nu nog denken de meeste menschen er niet dieper over na--dat het even gemakkelijk is het onderscheid tusschen den homo sapiens masculinus en den homo sapiens femininus te beschrijven, als het door het verschil in kleeding tusschen de beide sexen aangegeven wordt. Dit nu is niet het geval en het is zeer moeilijk, zoo niet onmogelijk, een eigenschap, een eigenaardigheid aan te toonen, die zóó specifiek bij de eene sexe voorkomt, dat zij bij de andere sexe niet te vinden is. Alle eigenaardigheden en eigenschappen, die men tot nu toe als specifiek voor de eene sexe heeft aangezien, vindt men terug of heeft men bij de andere sexe teruggevonden. Hoe meer de onderzoekingen der anthropologen worden uitgebreid, des te meer komt men tot de ontdekking, dat men zich in die eigenschappen heeft vergist of dat men er een te fantastische beteekenis aan heeft gehecht.

De vorm van het bekken b.v. dien men zelfs tot nu toe als een specifiek verschilsteeken tusschen de beide sexen heeft beschouwd, is gebleken niet zoo betrouwbaar te zijn. Men meent, dat een steil, nauw bekken aan den man eigen is, een wijd plat bekken alleen bij de vrouw voorkomt. Verschillende onderzoekers nu hebben aangetoond, dat men bij Arabische vrouwen en bij de vrouwen van sommige wilde stammen, wanneer men haar van achter beschouwt, onmogelijk door den vorm van het bekken kan uitmaken of men een man of wel een vrouw voor zich heeft.[3] De hand heeft een tijdlang als het verschils-kenteeken voor man en vrouw gegolden. Pfitzner de anatoom heeft eenige honderdtallen van mannen- en vrouwenhanden onderzocht en heeft geen enkel teeken kunnen aangeven, dat niet zoowel aan de vrouwenhand als, in andere gevallen, aan de mannenband eigen kan zijn[4]. Zelfs het ademhalingstype--de costaal- of borstademhaling bij de vrouw, de buikademhaling bij den man--is gebleken, wat de costaal-ademhaling betreft, door de kleeding en de beschaving te zijn ontstaan en het is bewezen, dat vrouwen van wilde volksstammen een abdominaal-ademhaling vertoonen, even goed als de mannen.[5]

Wanneer wij dus de eigenschappen en eigenaardigheden van de beide sexen willen bestudeeren, zijn wij gedwongen ons te houden aan wat bij de overgroote meerderheid der beide sexen voorkomt. En dan kunnen wij de verschillende eigenschappen, behalve in de twee groote groepen van primaire en secundaire geslachtskenmerken, verdeelen in vijf afdeelingen:

1e. De plaats waar de bevruchtende cellen gevormd worden: bij de vrouw het ovarium, bij den man de testis.

2e. De gangen en wegen, waarlangs de bevruchtende cellen het lichaam verlaten en naar buiten worden gevoerd: bij de vrouw de tubae, de uterus en de vagina, bij den man de epididymis, het vas deferens en de penis.

3e. De secundaire geslachtskenmerken, die eerst in den puberteitstijd duidelijk zichtbaar worden: bij de vrouw het langer worden van het hoofdhaar, het groeien der borsten en de menstruatie, bij den man de verandering van de stem, het groeien van den baard en het grooter worden van het strottenhoofd.

4e. De verschillende geestelijke en gevoelseigenschappen. De vrouw is o. a. meer intuïtief, zachtmoediger, passief, de man daarentegen logisch, harder, ondernemend e. d.

5e. De vrouw voelt zich geslachtelijk tot den man, de man voelt zich geslachtelijk tot de vrouw aangetrokken.

Het is van het grootste belang, duidelijk voor oogen te hebben, dat elk dier verschilsgroepen haar oorsprong in eenzelfden oeraanleg vindt.

Beschouwen wij de eerste groep iets nader. Wanneer men het menschelijk embryo vóór den dertigsten dag van het intrauterine leven beziet, kan men nog niet uitmaken of het een mannelijk of wel een vrouwelijk individu zal worden. De teeltklieren ontstaan in de buikholte, uit het epithelium, door Waldeyer "kiemepitheel" genoemd, dat naast de oernieren, aan de achterzijde van de buikholte ontstaat. Eerst in de vijfde week kan men door verschillende kenmerken bepalen of de teeltklier een ovarium of wel een

testikel zal worden. De ovariën blijven gedurende het geheele leven binnen het lichaam, terwijl de testikels kort vóór of kort na de geboorte buiten de buikholte dalen. Zelfs de kiemcellen zijn identieke vormsels. De kern van de eicel kan men gelijk stellen met den kop, terwijl het plasma van de eicel met den staart van het spermatozoïd kan vergeleken worden.

De tweede groep, de gangen en uitvoerwegen. In de tweede zwangerschapsmaand ziet men twee paar gangen in de buikholte ontstaan, de Wolffsche of oerniergangen en de Müllersche gangen, die naar onder loopen en te samen in de opening van de cloake (waarover straks) eindigen. Wordt het embryo een mannelijk individu, dan ziet men, dat de Wolffsche gangen zich sterk gaan ontwikkelen, terwijl de Müllersche gangen in ontwikkeling achterblijven. De ondereinden der vier gangen vergroeien met elkaar, er komen daaraan twee kleine uitstulpsels te voorschijn: de aanleg voor de latere prostata en de vesiculae seminales is daar. Wordt het individu daarentegen een vrouw, dan blijven de Wolffsche gangen in ontwikkeling achter, de bovenste gedeelten der Müllersche gangen worden de tubae, uit de benedenste, die met de uiteinden der Wolffsche gangen vergroeien, wordt de uterus en de vagina.

Doch ook de uitwendige geslachtsorganen zijn oorspronkelijk hetzelfde gevormd. Vóór de zesde week ziet men aan het ondereinde van het lichaam alleen een spleet, den uitgang van de cloake, de gemeenschappelijke afvoerbuis voor urine en faecaalstoffen. Pas in de tiende week van het intrauterine leven groeit een wand van binnen naar buiten in de cloake en vervormt die tot twee gangen, de eene voor den afvoer van de faecaalstoffen, de andere voor de latere wording van het urogenitaalstelsel. In de zesde week van het embryonaal bestaan, begint zich boven de cloake een knobbeltje te verheffen. In de tweede maand zien wij, dat daarin een spleet ontstaat, die zich richt naar dat gedeelte der spleet van de cloake, waaruit het urogenitaalstelsel zal worden en die zich daarin voortzet. Rondom de spleet welven een paar huidplooien op, terwijl er rondom het geheel een paar welvingen ontwikkelen, de geslachtswrongen.

Wordt het aanstaande individu een vrouw, dan verandert er verder maar heel weinig. Het knobbeltje groeit iets uit en wordt de clitoris, waarom heen zich een huidplooi legt, het praeputium clitoridis, terwijl het vooreinde zich verdikt en tot glans clitoridis wordt. De geslachtsspleet verdiept en verwijdt zich en wordt tot vagina, terwijl de geslachtsplooien die zich verder ontwikkelen tot labia minora, de wrongen--door groote vetvorming uitgegroeid--tot labia majora worden. Bij den man is de verandering die intreedt, grooter. Het knobbeltje verlengt zich meer dan bij de vrouw en wordt de penis, de randen van de geslachtsspleet groeien over de spleet heen en vormen de urethra, de geslachtsplooien groeien aaneen, waardoor het scrotum ontstaat, dat de neergedaalde testikels zal opnemen. De verschillende deelen der geslachtsorganen kan men dus met elkaar vergelijken: de clitoris komt overeen met den penis, de ovariën met de testikels, de labia met het scrotum, de uterus met de prostata.

Geschiedt nu echter de groei dier deelen niet zoo regelmatig als wij hierboven hebben aangegeven, maar blijven sommige deelen te vroeg in hun groei staan en groeien andere deelen te ver, dan ontstaat het individu, dat men met den naam "hermaphrodiet" bestempelt.

Deze naam is afgeleid van de namen ~Hermês~ (Hermes), en ~Aphroditê~ (Aphrodité), en is, volgens het verhaal door Ovidius in zijn Metamorphosen meegedeeld, ontstaan, doordat de zoon van Hermes en van Aphrodite zich in de bron Salmeikis baadde, waardoor de bronnymph verliefd op hem werd. Wijl hij haar echter verstootte, smeekte zij de Goden haar met het lichaam van haar geliefde te vereenigen. De goden willigden het verzoek in en daaruit is het tweeslachtig wezen, de "hermaphrodiet", geworden. Geoffroy Saint-Hilaire definieert het hermaphroditisme als "de werkelijke of schijnbare, geheele of gedeeltelijke aanwezigheid van twee sexen in hetzelfde individu".[6]

Reeds van de oudste tijden is het hermaphroditisme bekend en er is geen godsdienst bijna, waarin niet (bij de polytheïstische) de oppergod of (bij de monotheïstische) de godheid als een androgyne wordt gedacht en voorgesteld. De Persische Mithras-Mithradienst, de Egyptische Phtha en Isisdienst, hadden de voorstelling van een androgyne godheid. De Japansche god "de geest der aarde" wordt als twee-geslachtige godheid voorgesteld, en zelfs de Noorsche Frigadienst laat de voorstelling van androgynie herkennen. Dat de Grieken zich hun voornaamste Goden, Zeus, Aphrodite en Pan, als androgynen dachten, evenals de Romeinen hun Priapus, bewijzen de kunstvoortbrengselen, die ons van die tijden zijn overgebleven.[7]

Bij de Romeinen had men zeer vreemde opvattingen omtrent hermaphrodieten. Plinius verhaalt van een volk ergens in Afrika, dat geheel uit hermaphrodieten zou bestaan en deelt mee, dat hij zelf getuige er van is geweest, dat een hermaphrodiet willekeurig van geslacht kon veranderen. Bij de Wet der twaalf Tafelen was het den haruspices geoorloofd den hermaphrodiet te dooden, omdat de crimen laesae naturae niet ongestraft mocht blijven en de geboorte van een hermaphrodiet allerlei rampen voor het land voorspelde. Diodorus deelt mee, dat het verschijnen van een hermaphrodiet òf op de aanwezigheid van een God op aarde wijst,

die de zachtheid van de vrouw aan de kracht van den man paart, òf dat het een voorspelling inhoudt van groote rampen die over het land zullen komen.[8] Livius vermeldt eenige gevallen, waarin een hermaphrodiet ter dood is gebracht.[9]

Over het algemeen schijnen de Romeinen zich nog al veel met het hermaphroditisme te hebben bezig gehouden. In het Romeinsche recht toch wordt verschillende malen van den hermaphrodiet melding gemaakt. Ulpianus werpt de vragen op, of de hermaphrodiet mag getuigen, of hij het vaderlijk gezag mag uitoefenen, of hij mag erven en vindt een oplossing dààrin, dat hij zegt, dat het er van afhangt welke sexe er in den hermaphrodiet praevaleert.[10] Later zijn de gevoelens tegenover den hermaphrodiet gunstiger gestemd geworden, vooral ten tijde van Nero, wijl deze een zoodanige voorliefde voor hermaphrodieten schijnt te hebben gehad, dat hij zijn wagen bij voorkeur door vier hermaphroditische paarden liet trekken.[11]

Niettegenstaande sommige kerkvaders in de middeleeuwen Jehova als androgyn beschouwden, omdat hij Adam naar zijn evenbeeld had geschapen en deze androgyn moet zijn geweest--immers "creavit Deus eum ad imaginem suam, ad imaginem Dei creavit illum, masculum et feminam creavit eos"--bracht men de hermaphrodieten toch ter dood, omdat men meende, dat zij door God gezonden waren om zijn toorn te wreken en dat zij het naderen van rampen voorspelden. Men was van meening, dat de duivel er aan had deelgenomen, wanneer een hermaphrodiet werd geboren en de moeder werd dan ook gestraft, terwijl in sommige gevallen ook de vader niet vrijliep.[12] Bauhinius was nog op het einde van de 16e eeuw van oordeel, dat een hermaphrodiet moest gedood worden, terwijl Riolanus hetzelfde oordeelt in het begin van de 17e eeuw.[13] Later werd men gunstiger tegenover hen gestemd en bepaalde men er zich toe, om hen eenige rechten te ontzeggen. Wanneer een hermaphrodiet wilde huwen en de sexe was onduidelijk, dan werd het aan hem overgelaten een sexe te kiezen en mocht hij volgens die sexe huwen. Veranderen van sexe of geslachtsgemeenschap hebben anders dan naar de gekozene sexe, was niet geoorloofd en werd met den dood gestraft. Bauhinius verhaalt van een hermaphrodieten monnik, die zwanger werd en ter dood werd gebracht en voegt er aan toe: "Mas, Mulier, Monacus, Mundi Mirabile Monstrum."[14] De gevallen van Anne, later Jean, Grandjean en Marie, later Marin, Lemarcis, zijn beroemd geworden. Anne Grandjean was in 1732 in Grenoble geboren en als meisje opgevoed. Toen zij volwassen was geworden, bemerkte zij dat zij eigenlijk een man was, nam den naam van Jean Baptiste aan en trouwde met een vrouw. Toen dat bemerkt werd, veroordeelde de rechtbank hem als "profanateur du Sacrément du Mariage" tot verlies van eer, een lichamelijke straf en levenslange verbanning. Hij werd vrijgesproken maar werd gedwongen om in het vervolg altijd in vrouwenkleeren te gaan en om nooit meer met een vrouw geslachtsgemeenschap te hebben.[15]

Marie Lemarcis, die ook bemerkte, dat zij een man was, zich daarom Marin Lemarcis noemde, en met een vrouw wilde huwen, ontkwam ter nauwernood den dood door ophanging, doordat een voor dien tijd beroemd chirurg, Duval, tegen de expertise van vele anderen, verklaarde dat hij een man was. Hij werd veroordeeld om minstens tot zijn vijf en twintigste jaar vrouwenkleeren te dragen en het werd hem verboden om geslachtelijke gemeenschap met welke sexe dan ook, te hebben.[15]

Ambroise Paré verhaalt hoe hij het heeft bijgewoond, dat een meisje, door het springen over een sloot, plotseling van meisje jongen werd. Het omgekeerde, zegt Paré, dat een jongen een meisje wordt, komt nooit voor, "omdat de natuur altijd er naar streeft het volmaakte te bereiken".[16]

Door de onderzoekingen in de laatste eeuw nu, is het wezen van den hermaphrodiet beter bekend geworden en al weet men nog niet de oorzaak waardoor het hermaphroditisme ontstaat, men weet waardoor het tot stand komt. Wanneer bij een vrouwelijk individu de clitoris te groot wordt, de labia gedeeltelijk of geheel vergroeien en, zooals vele malen het geval is, er een hernia labialis (een breuk in een der labia majora, het afdalen van een darmlis in een der labia majora) bestaat; wanneer bij den man de penis niet de normale grootte bereikt, de beide helften van het scrotum zich niet vereenigen en de plaats der vergroeiing open blijft, de urethra zich eveneens niet sluit (hypospadie), maar zich in de splijting van het scrotum voortzet, wanneer daarbij de testikels niet in het scrotum dalen, maar in de buikholte of in het lieskanaal blijven (cryptorchie), dan heeft men de anatomische afwijking voor zich, die men met den naam van "uitwendig hermaphroditisme" bestempelt.

Al naar gelang van de twee soorten of van de enkele soort van teeltklieren, die in hetzelfde individu aanwezig zijn, terwijl de aard der geslachtsgangen of der uitwendige geslachtsorganen bij datzelfde individu, beiden of een van beiden, wel of niet met den aard dier twee soorten of der enkele soort van teeltklieren overeenkomt, verdeelt men de hermaphrodieten in "ware" en "onechte", onderscheidt men den "hermaphroditus verus" (androgynie, gevallen waarin zoowel testes als ovariën, onverschillig in welk stadium van ontwikkeling, in hetzelfde individu aanwezig zijn, met normale of misvormde uitwendige geslachtsorganen) en den "pseudohermaphroditus", den "hermaphroditus spurius" (wanneer bij ééngeslachtelijke ontwikkeling der teeltklieren, de inwendige en de uitwendige geslachtsorganen of een van beiden het type van het andere geslacht naderen).

Men heeft het hermaphroditismus verus verdeeld in h. v. bilateralis, unilateralis en lateralis, al naar gelang er in de buikholte aan beide zijden een ovarium en een testis te samen zouden voorkomen, of wel een ovarium èn een testis te samen aan de eene zijde en een ovarium òf een testis aan de andere zijde, of ook wel een ovarium aan de eene, een testis aan de andere zij. Theoretisch beredeneerd is een zoodanig voorkomen van herm. ver. natuurlijk mogelijk. In werkelijkheid echter is het bestaan er van nog nimmer vastgesteld en de eenige gevallen, vijf in aantal, van herm. verus zijn die, waarin het voorkomen van een zoogenaamden "ovotestis" is gevonden, het voorkomen namelijk van een teeltklier, waarin zoowel ovariaal als testikulair weefsel door het microscopisch onderzoek kon worden aangetoond. Onder de reeks gevallen van herm. ver. die Neugebauer in zijn werk "Hermaphroditismus beim Menschen" heeft opgeteld, zijn deze vijf de eenige waarbij echt herm. ver. is aangetoond. De overige gevallen zijn niet door een microscopisch onderzoek bewezen gevallen van herm. ver. te zijn geweest, ofschoon men ze er wel voor had gehouden.[17]

Van meer praktisch belang dan ook zijn voor ons de pseudohermaphrodieten. Men kan te doen hebben met een psh. externus, met een psh. internus of met een psh. completus of externus _et_ internus. Bij den psh. internus vindt men, behalve de inwendige geslachtsorganen die bij de sexe van het individu behooren, min of meer ontwikkelde inwendige geslachtsorganen van de andere sexe. Bij den psh. externus zijn de uitwendige geslachtsorganen van het individu zoodanig vervormd, dat men in twijfel kan verkeeren of men met vrouwelijke dan wel met mannelijke uitwendige geslachtsorganen te doen heeft. Bij den psh. completus ziet men de vereeniging van beide bovengenoemde afwijkingen. Men geeft den psh. de sexe, die door de teeltklier wordt aangetoond. Zoo vindt men bij den psh. intern. masc. behalve de testes en de inwendige mannelijke geslachtsorganen, b.v. een min of meer goed ontwikkelden uterus, bij den femininus, behalve de ovariën en de inwendige vrouwelijke geslachtsorganen, b.v. resten van het vas deferens.

Het meest van praktisch belang zijn voor ons de pseudoh. externi, omdat het interne psh. niet gemakkelijk bij het leven kan worden gediagnosticeerd en omdat het interne psh. meestal pas in aanmerking komt, wanneer het externe psh. tot een onderzoek heeft aanleiding gegeven.

Wat den hermaphrodiet of pseudohermaphrodiet betreft, wanneer men hem uit het oogpunt beschouwt van medeburger in de samenleving, zoowel de een als de ander kan zich als gewone, niet-misvormde menschen gedragen en dikwijls vindt men dan ook geen enkel verschil tusschen hun doen en laten en dat van den normaal-gevormden. Toch komen onder pseudohermaphrodieten zeer veel geestesstoornissen en verschillende afwijkingen op geestelijk en zedelijk gebied voor. Zonder nog zoo ver te gaan als Debierre, die--terwijl hij den hermaphrodiet en den pseudoh. onder de gedegenereerden rangschikt--hen in een toestand acht, waardoor zij een of anderen dag alle symptomen van lijders aan een degeneratie-psychose kunnen gaan vertoonen[18], zijn de meeste schrijvers het er over eens, dat het meerendeel der pseudoh.--ofschoon onder hen personen gevonden worden, die een uitstekend verstand en een zeer goeden aanleg hebben--over het algemeen, niet zóó ontwikkeld is, als normaal-gevormde menschen. De misvorming der teeltklieren en der geslachtsorganen laat wel degelijk haar schadelijken invloed bij hen gelden.[19]

De geslachtsdrift der meeste hermaphrodieten is gering, wat met het oog daarop, dat hun teeltklieren nooit zóó als bij normalen zijn ontwikkeld, niet te verwonderen is. Een enkele uitzondering daargelaten, waarin inderdaad een normale of misschien verhoogde potentie aanwezig is of was, moet men de verhalen der psh. op dat gebied als overdreven betitelen en vooral mededeelingen van psh. dat zij nu eens als man dan weer als vrouw geslachtsgemeenschap hebben gehad of kunnen hebben, meestal als een weinig fantastisch en met zekere restrictie aannemen.

De gevallen, waarin het voor den jurist en voor den medicus van belang is van het hermaphroditisme of van het pseudohermaphroditisme op de hoogte te zijn, zijn de volgende.

Ten eerste de gevallen van zoogenaamde "erreur de sexe", waarin namelijk het individu door een vergissing is ingeschreven bij den burgerlijken stand als behoorende tot de eene sexe en naderhand of op later leeftijd bemerkt, dat hij tot de andere sexe behoort en nu van sexe wil veranderen; 2e. gevallen van vergrijpen tegen de eerbaarheid, 3e. gevallen waarin een huwelijk blijkt te zijn gesloten met een hermaphrodiet en waarin op grond daarvan, dat de vrouw eigenlijk een man of de man eigenlijk een vrouw is, nietigverklaring van het huwelijk gevraagd wordt.

Wat de eerste gevallen betreft, verwijs ik U naar wat ik U heb meegedeeld van de beeldhouwster die nu als beeldhouwer in het buitenland vertoeft en naar de historische verhalen van Marin Lemarcis en Anne Grandjean, die wij zoo even hebben besproken. Omtrent de aanslagen tegen de eerbaarheid wil ik u doen opmerken, dat het b.v. zou kunnen geschieden, dat iemand beschuldigd wordt geslachtelijke gemeenschap te hebben gehad met een vrouw, tegen haar wil of terwijl zij in bewusteloozen toestand verkeert

en dat het blijkt, dat deze vrouw een pseudh. masculinus is, een geval van "erreur de sexe". Ook kan ik mij het geval voorstellen, en het is ook geschied, dat een man beschuldigd wordt geslachtsgemeenschap met een vrouw tegen haar wil te hebben gehad en dat het blijkt, dat de verkrachter eigenlijk een vrouwelijke psh. is. Het omgekeerde kan eveneens plaats hebben. Ik herinner mij niet welke schrijver het geval meedeelt, van een vroedvrouw, die beschuldigd werd onzedelijke handelingen te plegen met vrouwen, die zij in haar verlossing had bijgestaan en van wie het bij onderzoek bleek, dat deze vroedvrouw een mannelijke psh. was. En wat de derde categorie aangaat, wil ik u doen opmerken, dat Neugebauer verschillende gevallen, zoowel uit de literatuur als uit eigen praktijk, aanhaalt, waarin de vrouw die wilde huwen of reeds gehuwd was, bij onderzoek bleek een psh. masculinus te zijn, die door een "erreur de sexe" als vrouw was opgevoed. Het is nog niet zoo heel lang geleden, dat ik vernomen heb, dat een gynaecoloog hier in Amsterdam, een dame op zijn spreekuur ontving, die hem kwam consulteeren over de vraag of zij kinderen kon krijgen. Zij was al eenige jaren getrouwd en zij en haar man waren zeer gelukkig, alleen ontbrak aan hun geluk dat zij geen kinderen hadden. Bij onderzoek bleek het den gynaecoloog, dat hij met een mannelijke psh. te doen had, met een geval dus van "erreur de sexe". Hij is zoo verstandig geweest, die "dame" met vage troostwoorden naar huis te zenden en haar niet het geheim van haar sexe te openbaren, om niet twee menschen, die heel gelukkig waren, ongelukkig te maken. Of de openbaring hem iets zou hebben gebaat, staat te bezien. In bijna alle gevallen die Neugebauer meedeelt, zijn de mannelijke psh. tòch als vrouw gehuwd en hebben met hun man, die al of niet van hun toestand afwist, een zeer gelukkig leven geleid. Neugebauer deelt mede, dat het hem ettelijke malen is geschied, dat, wanneer hij den persoon op de erreur de sexe opmerkzaam maakte, groot verdriet en onwil om van sexe te veranderen het gevolg van zijn waarschuwing waren. Weinige maar stemden in een verandering toe. In hoeverre bij de erreur de sexe de opvoeding invloed heeft gehad, kan men niet goed bepalen. Moll ontkent dien grooten invloed van de opvoeding op het sexueele leven of liever op het zich man of vrouw voelen en zegt dat een of anderen dag de ware sexe wel te voorschijn komt, tegen de verkeerde opvoeding in.[20] Neugebauer is van tegenovergesteld oordeel en haalt eenige gevallen aan, waarmee hij zijn opvatting bewijst.[21] Zeker is het, dat sommige gevallen bekend en beschreven zijn, waarin, niettegenstaande de verkeerde opvoeding, de echte sexe toch de overhand nam, terwijl er andere voorbeelden zijn, waarin dat niet heeft plaats gehad. Het is waarschijnlijk de kwestie en het hangt er van af, in welke mate ontwikkeld de secundaire psychische geslachtskenmerken van de eene of van de andere sexe al of niet aanwezig zijn.

Evengoed nu als er verwisseling om zoo te zeggen der primaire geslachtskenmerken van de eene sexe naar de andere kan plaats vinden, kan hetzelfde ook geschieden met de secundaire geslachtskenmerken.

De borsten, die in het algemeen goed ontwikkeld alleen bij vrouwen voorkomen, terwijl de man slechts rudimenten--in ontwikkeling achtergebleven--borsten vertoont, kunnen bij den man groeien en het klierweefsel kan bij den man dermate ontwikkelen, dat de functie van het mamma-weefsel aan die van de vrouwelijke borst gelijk wordt. In de gevallen nu, waarin het borstklierweefsel bij den man even sterk als bij de vrouw ontwikkeld is, heeft men te doen met wat men betitelt met den naam van "gynaecomastie". Er zijn verschillende gevallen bekend, waarin de man de functie van de vrouw overnam en in plaats van deze, den zuigeling zoogde. In het bekende werk van Ploss-Bartels "Das Weib", komen eenige zoodanige gevallen vermeld voor, onder andere een door Alexander van Humboldt meegedeeld en een door Bernard van Ornstein.[22] Darwin verhaalt van een neger, die zijn kind de borst gaf en Geijll, de gynaecoloog, die vroeger te Dordrecht praktiseerde, haalt verschillende gevallen aan, waarin òf de afgescheiden vloeistof uit de mannenborst aan een microscopisch onderzoek is onderworpen en waardoor is vastgesteld, dat de vloeistof inderdaad melk was, òf--en deze gevallen door hem aangehaald, zijn door Volkmann, Israel, Stieda en Gruber te boek gesteld--het mammaweefsel den bouw vertoonde van dien der vrouwenborsten.[23]

Ook in den haar- en baardgroei vindt men die verwisseling. Ofschoon het algemeen is, dat baard en snor alleen bij mannen voorkomen, zijn er ettelijke gevallen bekend, waarin vrouwen een even sterk-ontwikkelden baard droegen als een man. Bérillon te Parijs, heeft in een boek "Les femmes à barbe" al de gevallen verzameld, die bekend zijn van vrouwen met baarden. Twee "précieuses" uit de 17e eeuw, Madame Pilou en Madame Cornual, waarover in de Mercure de France van het jaar 1907 een uitstekend opstel is verschenen[24], waren bekend om hun mannelijken haartooi.

Wij behoeven er niet op te wijzen, dat een verwisseling in stemklank, een diepe stem bij de vrouw en een hooge stem bij den man, dikwijls voorkomt. Bij den man heeft in de puberteit een verandering in zijn stemgeluid plaats; hij krijgt, zooals het genoemd wordt "den baard in de keel", zijn stemgeluid wordt dieper. Ettelijke gevallen zijn er bekend--en men behoeft maar rondom zich te luisteren om het zelf op te merken--waarin mannen een hooge vrouwenstem behouden, terwijl vrouwen een stemgeluid laten hooren, dat aan dat van een man doet denken.

Zelfs in de twee meest eigenaardige uitdrukkingen van de psyche, in het handschrift en in den gang, vindt men die verwisseling. Hoevele mannen hebben niet een handschrift, dat aan dat van de vrouw doet denken, terwijl vrouwen een handschrift vertoonen,

dat zóó sprekend op dat van een man gelijkt, dat men er zich zeer gemakkelijk in vergist.

Even goed echter als die verwisseling plaats heeft in de primaire en in de secundaire geslachtskenmerken, kan een verwisseling voorkomen in de laatste groep der geslachtskenmerken, in de groep waarin wij de geslachtsrichting hebben gerangschikt, namelijk dat de vrouw zich tot den man en de man zich tot de vrouw geslachtelijk voelt aangetrokken. Het kan geschieden, dat juist het omgekeerde plaats heeft en dat de man geslachtelijk voor den man, de vrouw geslachtelijk voor de vrouw voelt. Waar dit het geval is, hebben wij te maken met de groote groep van menschen, die--zooals Marc André Raffalovich zegt--"dès leur jeunesse, avant la puberté, sont portés spontanément, sentimentalement, sensuellement, sexuellement, amoureusement, intellectuellement vers d'autres individus du même sexe"[25], met de homosexueelen, de urningen, de uranisten.

De naam "homosexueel" is afgeleid van het Grieksche ~homoios~---de gelijke en het latijnsche "sexualis", in tegenoverstelling met hen, die zich tot personen van de andere sexe voelen aangetrokken en die "heterosexueelen" worden genoemd, dat is afgeleid van het grieksche "~heteros~"--de een van twee en het latijnsche "sexualis". Het woord "urning" door de Franschen vermooid tot "uranist", is het eerst door Numa Numantius gebruikt, het pseudoniem van Karl Heinrich Ulrichs, en is afgeleid uit een plaats in het Symposion van Plato. De Grieken onderscheidden twee Aphrodités, de oudste geboren uit Zeus en Dione was de Aphrodité pandémos, de jongste--Aphrodité urania--is geboren uit het zeeschuim, dat rondom het geslachtsorgaan van Zeus opspatte, toen het door den jongste der Titanen, Kronos, was afgesneden en in zee geworpen en is ontstaan zonder dat een vrouw aandeel in haar wording heeft gehad. De Eros pandémos is de liefde waarmede alle menschen beminnen, terwijl die van Urania, waaraan geen vrouw heeft deel gehad, de liefde van mannen tot mannen is. De liefde van mannen voor mannen heet "paederastie", die van vrouwen voor vrouwen "tribadie", welke namen dikwijls verkeerdelijk voor de geslachtsdaad worden gebruikt. De geslachtsdaad tusschen mannen heet "pedicatie", die tusschen vrouwen "amor lesbicus", terwijl de spiritueele liefde tusschen mannen den naam "amor platonicus", die tusschen vrouwen dien van "amor sapphicus" draagt.

Ik zal in de volgende bladzijden voornamelijk van den mannelijken homosexueel, van den uranist spreken, omdat van dezen het meeste bekend is en omdat de vrouwelijke homosexualiteit nog niet zoo grondig is bestudeerd, al komt deze waarschijnlijk in even groote mate als de mannelijke voor.

Even wil ik de opmerking maken, dat men wel moet onderscheiden tusschen den uranist en hem die homosexueele geslachtsdaden doet. De uranist doet wel homosexueele geslachtsdaden, maar blijft altijd uranist, dat is iemand die zich geslachtelijk uitsluitend tot personen van zijn eigen sexe voelt aangetrokken, terwijl hij die homosexueele daden doet zeer goed een heterosexueel kan zijn. Homosexueele daden plegen en uranist-zijn is niet hetzelfde en er ligt een hemelsbreed verschil tusschen den heterosexueel, die door gebrek aan vrouwen (in pensionaten, op schepen, in gevangenissen waar de gevangenen gemeenschappelijk zijn opgesloten enz. enz.), uit winstbejag (prostitutie) of uit vriendschap, homosexueele daden met een homosexueel of zelfs met een anderen heterosexueel pleegt en den echten uranist. De eerste toch zal, wanneer de gelegenheid weer daar is, tot het heterosexueel geslachtsverkeer teruggaan, zijn ware natuur weer laten gelden, terwijl de ander, die ook zijn ware natuur laat gelden, homosexueel zal blijven.

Homosexueel geslachtsverkeer, hetzij dan door echte uranisten of door heterosexueelen, is al van de verste oudheid bekend. De godsdienstplechtigheden voor Baäl gingen gepaard met homosexueele geslachtsuitingen, evenals de plechtigheden bij den dienst van Isis. Lydië, Syrië, Perzië waren bekend om het homosexueel geslachtsverkeer, dat daar inheemsch was en het is waarschijnlijk daarop, dat Paulus in zijn waarschuwing tegen den omgang met deze volken doelde. Jezus had waarschijnlijk den uranist op het oog, toen hij (Mattheüs 19:12) sprak: "En er zijn gesnedenen die alzoo uit huns moeders lichaam geboren worden.... begrijpe wie het kan". Bij de Joden was de homosexueele geslachtsuiting strafbaar. In Leviticus 18:22 staat geschreven: "Bij een man zult gij niet liggen met vrouwelijke bijligging, want het is een gruwel", terwijl in Leviticus 20:13 staat: "Wie bij een manspersoon zal hebben gelegen met vrouwelijke bijligging, zij hebben beide een gruwel gedaan en zullen gedood worden, hun bloed kome over hen". Herodotus en Hippocrates beschrijven de verschijnselen van een ziekte die bij de Scythen voorkomt, de Scythenziekte, ~thêleia nousos~, genaamd, waarbij de mannelijke personen al de eigenschappen van een vrouw kregen en niet meer in staat waren om voort te planten.[26] Dat het homosexueel geslachtsverkeer bij de Grieken inheemsch was, bewijzen de legenden van Zeus en Ganymedes, de overlevering van de verhouding tusschen Socrates en Alcibiades. Ja, zoodanig was het homosexueel geslachtsverkeer in de Grieksche maatschappij ingeweven, dat de geneesheeren, wanneer zij den eed zwoeren, beloofden, in welk huis zij ook kwamen, dit alleen te zullen doen voor het heil van de zieken "en zich te zullen onthouden van wellustige daden op de lichamen der vrouwen en der mannen, zoowel vrijen als slaven".[27] Wat het Romeinsche Rijk betreft, heeft Petronius ons beschrijvingen van het dagelijksch leven der Romeinen nagelaten, waaruit duidelijk blijkt hoezeer het homosexueel geslachtsverkeer daar gewoonte was. Caesar, dien wij als een geheel ander man zien, naar wat wij over hem hebben geleerd in

"de Bello Gallico", was bisexueel en werd "de man van alle vrouwen en de vrouw van alle mannen" bijgenaamd. Nero's homosexualiteit en zijn verhouding met den vrijgelatene Rufus zijn bekend, terwijl de uitspattingen van Heliogabalus, die als zonnepriester zich bij voorkeur in vrouwelijke kleêren vertoonde, door verschillende schrijvers vermeld zijn. De verhouding van Hadrianus met Antinous, den prachtig-gevormden jongeling, over wiens dood altijd een geheimzinnige sluier is gebleven, is te dikwijls genoemd, dan dat ik er nog melding van behoef te maken.

Ik wil hier en daar een greep uit de geschiedenis doen, en ga over tot de middeleeuwen. In het werk van Karl Julius Weber, "Das Pabstthum und die Päbste", lezen wij van de homosexueele daden die in de kloosters in de middeleeuwen werden gepleegd, niettegenstaande het telkens herhaald verbod en de straffen er op gesteld. Paul Zacchias en Ludovicus Claepius hebben hoofdstukken in hun werken gewijd aan den "Crimen sodomiae" en men vindt elders verhaald, hoe in den tijd der minnestreelen, niettegenstaande de schijnbaar groote vereering voor de vrouw, homosexueele handelingen naast die vereering voorkwamen. Vorstelijke personen zijn uranist geweest. Wij noemen Jakobus den eerste van Engeland en Eduard den derde. Aan het Fransche Hof waren homosexualiteit en homosexueele geslachtsdaden zoo gebruikelijk en zoo ingeweven, dat Elisabeth Charlotte, de schoonzuster van Louis Quatorze aan de keurvorstin Sophie schreef: "wie zijn kind lief heeft, moet het niet aan het Fransche hof sturen. De daden waarom Sodom en Gomorrha zijn verwoest, zijn niets, vergeleken bij de schandelijkheden die hier geschieden. Mannen leven met mannen, vrouwen leven met vrouwen en behalve de koning, de koningin en de Dauphin, is hier niemand te vertrouwen". De homosexueele daden en het uranisme, gepaard met verregaande effeminatie, van den broer van Louis Quatorze, van Philippe, Duc d'Orléans, waren algemeen bekend, evenals zijn verhouding met den Chevalier de Lorraine en den Marquis d'Effiat. Trouwens hij had een voorganger gehad in Hendrik den derde die, psychosexueel hermaphrodiet, na eerst een heterosexueele liefde te hebben gevoeld voor Marie de Clèves en andere vrouwen, zich later als homosexueel deed kennen.[28] Duitschland is niet vrij gebleven wat zijn vorsten betreft. Frederik de Groote en zijn broeder Heinrich waren uranisten, evenals Rudolph de tweede van Habsburg, een feit dat Heine in zijn Schlosslegende, die men alleen in de oude Hamburgsche uitgaven vindt en die men uit de latere uitgaven heeft verwijderd, heeft bezongen en die een van de redenen is geweest, of er zeker toe heeft bijgedragen, dat men hem uit Duitschland heeft verbannen. Van de latere Europeesche vorsten wil ik alleen Ludwig den 2e van Beijeren noemen, den krankzinnig-geworden uranist, aan wien wij het te danken hebben, dat de muziek van Wagner is bekend geworden[29], terwijl ik--uit vrees dat ik misschien wegens majesteitsschennis zou vervolgd worden--de namen van tegenwoordig levende vorstelijke personen liever wil verzwijgen.

Ook onder geleerden vindt men uranisten. Winkelmann, de vriend van Goethe, was uranist en werd te Triëst door Arcangeli, met wien hij in een homosexueele verhouding leefde, vermoord. Johannes v. Müller was uranist, even als de schrijver Grillparzer en de dichter August v. Platen.[30] Michel Angelo was uranist, al wil men ook beweren, dat hij wel degelijk een vrouwenliefde in zijn leven heeft gehad, de liefde van Vittoria Colonna. Behalve zijn sonnetten, die--al is het geen onomstootelijk bewijs--er voor pleiten, was zijn omgang en zijn verhouding tot Thomaso de Cavalieri van dien aard, dat de waarschijnlijkheid voor zijn homosexueel voelen een zeer groote is. Ook bij latere artiesten vindt men uitgesproken uranisme. Oscar Wilde was uranist, wat hem het proces heeft op den hals geschoven, dat zijn veroordeeling tengevolge heeft gehad, een proces dat als een der grootste schandalen in de historie der Engelsche rechtspleging zal blijven bestaan.[31] Van Walt Whitman[32] zegt men, dat hij uranist was, ofschoon er in den laatsten tijd stemmen opgaan, die het tegendeel volhouden.[33] Paul Verlaine, de poète maudit, was bisexueel en heeft, iets wat van algemeene bekendheid is, een homosexueele verhouding met Arthur Rimbaud gehad.[34] Onder de krijgslieden kan ik U le grand Condé noemen en generaal Mac Donald, die zich in den Boerenoorlog heeft onderscheiden en den naam van "fighting Mac" heeft gekregen.[35] Wanneer ooit een regeering zich huichelend en verachtelijk heeft gedragen, is het de Engelsche geweest, die zelfs geweigerd heeft, nadat Mac Donald om zijn uranisme in den dood was gejaagd, zijn begrafenis met militaire eer te laten plaats hebben. En ten laatste is het nog niet zoolang geleden, dat men zou vergeten hebben, dat Krupp,[36] de groote industrieel, zich van het leven heeft beroofd, omdat hij uranist zijnde, voor de vervolgingen waarmee paragraaf 175 hem bedreigde, bevreesd was.[37] Het zou mij gemakkelijk vallen deze lijst met nog vele namen te vergrooten.

Ofschoon er reeds in de geschriften van Restif de la Bretonne[38], in die van Casanova[39], in die van Montesquieu[40] en die van Voltaire[41] van de homosexualiteit en van het uranisme wordt melding gemaakt, duurde het tot het einde van de 18e eeuw, voordat de aandacht van de geleerden op het onderwerp werd gevestigd. Meiners[42] was de eerste, die een aantal feiten verzamelde en die te boek stelde, waaruit men over het uranisme en de homosexualiteit eenigszins op de hoogte kon komen. Niettegenstaande na hem Ehrenberg[43], Brière de Boismont[44], Hössli[45], Michéa[46] en anderen over het onderwerp schreven, ging het vraagstuk onopgemerkt aan de aandacht voorbij en was het Casper, de Duitsche gerechtelijk-geneeskundige, die in het jaar 1852 de kwestie weer ter sprake bracht.[47] Merkwaardig mag men het noemen, dat waar Casper reeds toen verkondigde, dat homosexualiteit en uranisme niet altijd de gevolgen zijn van zedebederf en van onzedelijkheid, de tegenovergestelde opvatting

door de jaren heen, niettegenstaande de tegenwerpingen van den kant der nieuwere onderzoekers ingebracht, tot nu toe heeft stand gehouden. Weer geraakte het vraagstuk op den achtergrond, totdat in het jaar 1870 of omstreeks dien tijd v. Krafft-Ebing zijn beroemd werk "Psychopathia sexualis" in het licht gaf. Kort vóór hem, had de Hannoversche assessor Karl Heinrich Ulrichs, onder het pseudoniem Numa Numantius, reeds in het jaar 1864, de eerste brochures van de reeks van twaalf, over het uranisme het licht doen zien, waarin hij het eerst den naam urning gebruikte.[48] Behalve dat Ulrichs op den juristendag te München, waar hij zijn opvattingen over het vraagstuk wilde verkondigen, bijna van het spreekgestoelte werd gesleurd en men het hem door kabaal en fluiten onmogelijk maakte om zijn redevoering ten einde te brengen, werd er niets gedaan om het vraagstuk dieper te doorgronden. Na v. Krafft-Ebing echter, en door zijn werk, was de aandacht voor goed op de kwestie gevestigd en weldra verschenen er in Duitschland, even als in Frankrijk mededeelingen over gevallen van homosexualiteit en uranisme. Toch bleef een geregeld doorgevoerde studie nog uit, niettegenstaande Albert Moll zijn boek over "Konträre Geschlechtsempfindung" had geschreven. Door het oprichten van het "Wissenschaftlich-humanitäre Comitée" in het jaar 1898 door Dr. Magnus Hirschfeld te Berlijn, dat ten doel heeft de geslachtelijke tusschentoestanden en vooral de homosexualiteit te bestudeeren, werd de aandacht voor goed op het vraagstuk gevestigd, vooral ook omdat een van de eerste daden van het Comitée was, een petitie tot de Regeering te richten, waarbij verzocht werd, paragraaf 175, de zoogenaamde "urningen-paragraaf", uit het strafwetboek te verwijderen. Deze paragraaf toch, hebben wij gezien, stelt de geslachtsuitingen tusschen mannen strafbaar en geeft tot niet anders dan tot chantage aanleiding, terwijl er tevens een groote onbillijkheid in ligt opgesloten, omdat wel de geslachtsdaden tusschen mannen, maar niet die tusschen vrouwen worden strafbaar gesteld.

Door het optreden van het Wissenschaftlich-humanitäre Comitée werd, om zoo te zeggen, de betoovering gebroken, waarin het onderwerp scheen te zijn bevangen en van alle kanten, zoowel in Duitschland als in andere landen, zagen de werken over uranisme en homosexualiteit het licht. In Duitschland waren het o. a. Näcke, Fuchs, Karsch, Iwan Bloch, v. Schrenck-Notzing, Benedikt Friedländer, om maar enkele te noemen, die hun onderzoekingen en hun opvattingen omtrent het vraagstuk het licht deden zien. In Engeland begon Havelock Ellis een studie-reeks over het normale en het afwijkende geslachtsleven, een boeken-rij die--om de merkwaardigheid dient het vermeld te worden--vertaald in het Duitsch en in Duitschland verschijnen moest, omdat de schrijver in het prude Engeland geen uitgever voor werken, over een dergelijk onderwerp handelend, kan vinden. In Frankrijk waren het Chevalier, Laupts (een pseudoniem, zooals hij mij meedeelde, omdat hij onder zijn eigen naam over dit onderwerp niet durft schrijven, uit angst zijn betrekking te zullen verliezen), Laurent, Lacassagne, Raffalovich (Marc André); in Italië Penta, die de Archivio di Psychopathie sessuali uitgaf, waarvan--jammer genoeg--maar één jaargang het licht heeft gezien, terwijl in ons land, behalve een opstel van mijn hand in de Psychiatrische en neurologische bladen van het jaar 1891[49] het werkje "Ongekend leed" en "Het Uranisch gezin" van Dr. v. Römer,[50] met het reeds genoemde rapport op het congres voor crimineele anthropologie in het jaar 1901[51] en een brochure die ik onder het pseudoniem "Karl Ihlfeld" heb geschreven,[52] het licht zagen. Een vertaling van het boekje van Wirz "Der Uraniër vor Kirche und H. Schrift"[53], alsmede een vertaling van het werk van Hirschfeld "Ursache und Wesen des Uranismus"[54] zijn daarna in Holland uitgegeven.

Gaan wij na welke opvattingen er over het uranisme en over de homosexualiteit heerschen, dan zien wij, dat vier opvattingen voornamelijk om den voorrang strijden.

De eerste opvatting is die, dat uranisme, dat homosexualiteit een gevolg is van een onzedelijk leven, van zedenbederf, van overprikkeling op geslachtelijk gebied, dat uranisme verkregen wordt door slecht voorbeeld, door verleiding en dat zij, die zich gedurende hun leven hebben te buiten gegaan aan heterosexueele geslachtsuitingen, eindelijk tot homosexueele daden hun toevlucht nemen, om aan hun behoefte naar nieuwe prikkels te voldoen. Deze opvatting van "verkregen uranisme" nu wordt door niemand meer gehuldigd, die zich ook maar eenigszins in de studie van het onderwerp heeft verdiept en alleen zij, die niets van het onderwerp weten en zich niet de moeite willen geven om het te bestudeeren, maar die zich tevreden stellen met steeds maar anderen na te praten, houden nog aan die opvatting vast.

Dat die opvatting in de wereld is gekomen en blijft bestaan, is niet te verwonderen. Men dacht en denkt aan de uitspattingen gedurende de décadence van het Romeinsche Rijk, waarin homosexueele geslachtsdaden gewoonte waren, maar vergeet er bij dat de heterosexueele uitspattingen toen ter tijd evenzeer een enormen omvang hadden aangenomen. Trouwens wij weten betrekkelijk zeer weinig van de Romeinsche maatschappij in dien tijd af, al kennen wij ook de verhalen van Petronius en anderen en zeker is het voor ons onmogelijk uit te maken, of de homosexueele geslachtsdaden ons uit dien tijd vermeld, de daden van echte uranisten waren of daden door mannelijke prostitués of andere heterosexueelen gepleegd. Een bewijs echter tegen de meening, dat het uranisme--en zelfs dat het plegen van homosexueele geslachtsdaden--altijd een gevolg van depravatie, van zedenbederf en van decadentie moeten zijn, is dat in den tijd van Pericles, in den bloeitijd van Athene, in de gouden eeuw, het

homosexueel geslachtsverkeer in Griekenland om zoo te zeggen algemeen was.

Dat de opvatting, dat uranisme en homosexualiteit een gevolg van uitspattingen op geslachtelijk gebied zijn, is ontstaan en bestaan blijft is te begrijpen. Men heeft de gevallen gezien van beginnende ouderdoms-kindschheid, van beginnende dementia paralytica e. d., waarbij zich dikwijls in het begin ethische en moreele defecten openbaren, waarbij zoo dikwijls een gebrek, een verkeerde handeling op zedelijk gebied de eerste aanduiding van de ziekte is, en heeft daaruit het besluit meenen te mogen trekken, dat deze handelingen het gevolg waren van vroeger-gepleegde uitspattingen en overprikkelde zinnelijkheid. Wij weten echter, dat het plegen van homosexueele geslachtsdaden volstrekt niet gelijk mag gesteld worden met uranisme en dat het plegen van homosexueele geslachtsdaden ook een gevolg van geestesstoornis kan zijn. Psychiaters kunnen getuigen, hoevele malen in de gestichten lijders aan dementie, of lijders aan andere psychosen, op het plegen van dergelijke daden betrapt worden.

En nog een oorzaak is er, waardoor men tot deze depravatie-opvatting is gekomen. Men heeft gevallen gezien van zoogenaamde "tardieve homosexualiteit", het opkomen van homosexueele geslachtsgevoelens op een zekeren leeftijd, vóór welken de persoon uitgesproken heterosexueel was. Dit verschijnsel dat nog niet goed bestudeerd en zeker nog niet verklaard is, komt meer voor dan men oppervlakkig zou meenen en de meeste gevallen, waarin men er van spreekt, dat iemand na een leven van heterosexueele uitspattingen homosexueel is geworden, berusten op het plotseling of langzamerhand te voorschijn komen van deze tardieve homosexualiteit. Trouwens in sommige gevallen kan de heterosexualiteit evenzoo tardief optreden. Mij is een geval bekend van een jongen man, die tot zijn vier en twintigste jaar uitgesproken en zeer duidelijk homosexueel was, die een of meer homosexueele verbintenissen heeft gehad en niet anders dan homosexueel aan zijn geslachtsdrift kon voldoen, en die langzamerhand zijn geslachtsrichting heeft voelen veranderen en nu reeds eenige jaren uitgesproken heterosexueel voelt. Zoowel de heterosexualiteit als de homosexualiteit echter zijn in die richting nog te weinig onderzocht en de heterosexualiteit wel het minst, zoodat men over deze kwestie nog geen zeker en nauwkeurig oordeel kan vellen. Een zekerheid echter is, dat die vorm van tardieve homosexualiteit bestaat en bestaan kan.

Wat nu echter tegen die onzedelijkheidsopvatting en tegen de meening, dat homosexualiteit door slecht voorbeeld en door omgang met homosexueele, onzedelijke individuen kan verkregen worden, spreekt, is dat het omgekeerde nooit nog is gezien. Wanneer het waar is, dat men na heterosexueele uitspattingen er gemakkelijk--door behoefte naar overprikkeling--toe komt, om homosexueele geslachtsdaden te doen, dan moet het ook kunnen dat een homosexueel--ten gevolge van oververzadiging door homosexueele geslachtsdaden--zijn toevlucht tot heterosexueele geslachtsdaden gaat nemen. Iets dergelijks nu is nog nooit opgemerkt en in de geheele literatuur over het uranisme en over de homosexualiteit is daarvan geen enkel voorbeeld te vinden, terwijl toch onder de homosexueelen even goed als onder de heterosexueelen losbollen en onzedelijke individuen worden gevonden! Te wenschen ware het wèl, dat het zou kunnen, dat men door overdadige heterosexueele uitspattingen homosexueel kon worden. Dan toch zou het omgekeerde ook het geval zijn en zou er een prachtig geneesmiddel gevonden zijn, om den homosexueel van zijn, door de maatschappij zoo verachte, neigingen te genezen. Tot nog toe echter heeft men nog niet kunnen ontdekken, of een zoodanige genezing of verandering bij een gedepraveerden homosexueel heeft plaats gehad.

En wat eveneens pleit tegen de opvatting, dat homosexualiteit kan verkregen worden, is dat waar de onanie zóó verbreid is, het percentage homosexueelen zoo betrekkelijk klein is en blijft. Volgens de meening van Rohleder[55] toch gaat 90% van het mannelijk geslacht zich in zijn jeugd aan onanie te buiten en een groot percentage daarvan pleegt, gedurende langer of korter tijd, mutueele onanie. Andere schrijvers achten het percentage niet zoo hoog, maar zijn het er toch over eens, dat het cijfer tamelijk groot is. Wanneer nu door homosexueelen omgang homosexualiteit verkregen zou kunnen worden, dan zouden zeker meer mannen dan nu homosexueel worden. Het percentage toch der homosexueelen is, zooals wij straks nog nader zullen bespreken, niet meer dan 2.3%. En wat wel het meeste er tegen pleit, dat homosexualiteit zou kunnen verkregen worden, is, dat het zoovele malen gebeurt en gebeurd is, dat bij heterosexueelen--die in hun jeugd gedurende zeer langen tijd met een homosexueelen vriend een homosexueele verbintenis hebben gehad, hetzij uit vriendschap of omdat zij het niet wilden weigeren, of omdat zij meenden dat dat de ware en eenige vriendschaps- en liefdesuiting is, onbekend met hun voelen en hun ziel--op een gegeven tijdstip hun ware gevoel wakker wordt en dat hun heterosexualiteit begint te spreken, zoodat zij de homosexueele verbintenis afbreken en een huwelijk met een vrouw sluiten uit liefde en uit heterosexueel gevoel. Wanneer homosexualiteit en uranisme zouden kunnen verkregen worden, dan zeker zou men onder die heterosexueelen toch menschen moeten aantreffen, die door hun homosexueelen omgang homosexueel of uranist zijn geworden. Zoo iemand, dan zijn zij wel in de gelegenheid geweest om van geslachtsrichting te veranderen.

Nogmaals, geen der onderzoekers, die zich ernstig met het vraagstuk heeft bezig gehouden of zich er nog in verdiept, huldigt de onzedelijkheidsmeening en alleen zij, die niets van het onderwerp weten of er niet of maar ten halve van op de hoogte zijn, houden

nog aan deze opvatting vast.

Een tweede opinie is, dat homosexualiteit, dat uranisme een uitvloeisel is van een stoornis in de geestvermogens van het individu, dat uranisme een psychopathie is.

Tot een zekere hoogte is v. Krafft-Ebing de schuld, dat deze opvatting ontstaan is en zich verbreid heeft. Hij toch is de eerste geweest, die van "psychopathia sexualis" heeft gesproken. En wel hadden Jolly en Moeli gelijk, toen zij in een zitting van de "Gesellschaft für Psychiatrie und Nervenheilkunde" te Berlijn, toen de benaming en het onderwerp, door v. Krafft-Ebing ingeleid, ter sprake kwam, de vrees uitten, dat men door dezen naam een verkeerden indruk zou krijgen en dat daardoor de opvatting der monomanieën, die met moeite was losgelaten, weer in de gedachten zou komen.[56] Het is geschied zooals Jolly en Moeli hebben gevreesd en niettegenstaande v. Krafft-Ebing later zijn eigen opvatting, als zou het uranisme een psychopathie zijn, heeft tegengesproken en in het derde deel van het Jahrbuch für sexuelle Zwischenstufen heeft bekend, dat hij zich heeft vergist en dat uranisme zich kan voordoen bij volkomen intactheid der geestvermogens, is de meening bij het publiek en bij het grootste deel der geleerden, dat geen kennis heeft genomen van den omkeer van v. Krafft-Ebing, blijven bestaan.[57]

Te verwonderen is het niet, dat v. Krafft-Ebing tot zijn opvatting kwam. Hij toch bestudeerde de afwijking bij de patienten in zijn krankzinnigengesticht, bij wie--zooals wij reeds hebben opgemerkt--homosexueele geslachtsdaden als uiting van hun geestesstoornis tamelijk dikwijls voorkomen. De psychiaters, die op zijn voetspoor het onderwerp eveneens bij de patienten in de gestichten bestudeerden, meenend--zooals tegenwoordig nog maar steeds het geval is--dat het onderwerp op het gebied van den psychiater en niet op dat van den gewonen geneesheer behoort (de gewone geneesheeren, niet-specialisten, zijn van eenzelfde opinie), moesten wel tot een zelfde conclusie komen. Zij, evenmin als v. Krafft-Ebing het had gedaan, dachten aan de onwillekeurige selectie die zij instelden, niet denkend aan het aantal uranisten dat niet in krankzinnigengestichten en--normaal van geestvermogens--wel in de maatschappij verkeert en nooit de gedachte krijgt om zich tot een psychiater te wenden. Waarom toch zouden zij dat doen? Geestelijk en wat hun ziel betreft, voelen zij zich geheel normaal en wanneer zij eenmaal op de hoogte van hun geslachts-verschil zijn, is er geen enkele reden voor hen zich tot een psychiater om raad en hulp te wenden. Dit groote aantal uranisten en homosexueelen nu, hebben v. Krafft-Ebing en de psychiaters over het hoofd gezien en dit zien de meeste psychiaters nog altijd over het hoofd en het is zeer waar wat Näcke zegt, namelijk, dat "wat psychiaters, neurologen en gerechtelijk-geneeskundigen van homosexueelen onder de oogen komt, meestal abnormaal is, maar dat men dit daarom niet in algemeenen zin mag toepassen. Deze artsen zijn daarom in zake homosexualiteit meer of minder incompetent, wijl zij juist de duizenden urningen, die gewoon in de maatschappij leven, niet kennen".[58]

Wanneer men nu, behalve de verbeterde uitspraak van v. Krafft-Ebing zelf, de uitspraken van de competente onderzoekers op dit gebied nagaat, de uitspraken van Hirschfeld, die minstens 5000 uranisten heeft onderzocht, van Fuchs, van Näcke, Bloch, v. Schrenck-Notzing, dan ziet men dat geen van hen het oordeel dat uranisme een psychopathie is, is toegedaan. Noch Lacassagne, noch Havelock Ellis, noch v. Römer, die alle ettelijke uranisten hebben onderzocht, hebben zich dan ook in die richting uitgesproken, integendeel hebben zij de opvatting "psychopathie" met alle kracht tegengesproken. Wat mijn eigen onderzoekingen betreft, al is het aantal uranisten dat ik heb onderzocht niet zóó groot, dat ik mij als de evenknie van de genoemde onderzoekers durf opwerpen, toch heb ik nog geen enkelen uranist ontmoet, bij wien ik een geestesstoornis of een ziekelijke stoornis in de geestvermogens heb kunnen vaststellen. Wel heb ik in eenige krankzinnigengestichten lijders gezien, die nu en dan pogingen deden om homosexueele geslachtsdaden te doen, maar bij dezen waren de daden een gevolg van hun psychisch defect en niet van hun homosexualiteit of van hun uranisme.

Ook de opvatting "psychopathie" wordt dan ook niet meer door de competente onderzoekers van dit onderwerp verdedigd.

Schijnbaar meer naar waarheid is de opvatting, dat uranisme en homosexualiteit een degeneratie, of een verschijnsel van degeneratie is.

Nu wil het mij echter voorkomen, of men in den laatsten tijd wat al te veel gebruik en zelfs misbruik van het woord "degeneratie" maakt. Alle menschelijke uitingen, die niet zoo dadelijk geweten, gevoeld of begrepen worden, is men maar al te veel geneigd met het woord degeneratie te bestempelen. Daarenboven zegt het woord "degeneratie" betrekkelijk weinig, en zeker is het niet een verklaring. Door het woord te gebruiken, stelt men vele malen een ander woord in de plaats voor het verschijnsel of het feit dat niet begrepen of geweten wordt.

Gaan wij echter nauwkeuriger na, welke verklaring men van "degeneratie" heeft gegeven, dan zien wij al heel spoedig, dat geen der definities past voor het uranisme. Magnan zegt, dat degeneratie "de ziekelijke toestand van het individu is, dat in vergelijking

met zijn ouders, constitutioneel verminderd is in zijn psycho-physisch weerstandsvermogen en slechts onvolkomen de biologische voorwaarden om den erfelijken strijd om het bestaan vol te houden, verwezenlijkt"[59]. Wertheim Salomonson zegt, "dat wij dan degeneratie kunnen constateeren, wanneer wij bij een individu een zoodanige afwijking van het type ontmoeten, dat wij, uit de ervaring van soortgelijke gevallen opgedaan, mogen besluiten, dat deze vermoedelijk op het kroost in meer ernstigen vorm zal worden overgedragen, terwijl zij bij de ouders reeds in meer gemitigeerden vorm aanwezig was."[60] Möbius voert aan, dat wij met "degeneratie zoodanige ongunstige afwijkingen van het type kunnen bestempelen, die een zekere grootte bereiken, blijvend zijn en door erfelijkheid op de nazaten kunnen overgaan",[61] terwijl Hoche degeneratie een "aus der Art schlagen" noemt en eveneens van "ongunstige afwijkingen van het type" spreekt.[62]

Vergelijken wij den uranist en het leven van den uranist met deze definities, dan zien wij, dat waar van een type wordt gesproken, nergens een type van een man of van een vrouw kan worden aangetoond. Wij hebben gezien, dat wij--omdat het type ontbrak--gedwongen waren om alleen met de eigenschappen, die bij de overgroote meerderheid der sexen voorkomen, rekening te houden. Wat dus "afwijking van het type" moet leeren, is niet duidelijk. Wat betreft het overgaan der afwijkingen op de kinderen, het is door verschillende onderzoekers bewezen, dat in de ascendentie van den uranist geen of bij uitzondering uranisten voorkomen en dat ook in de nakomelingschap van den uranist (soms toch krijgt de uranist, die om verschillende redenen kan getrouwd zijn, kinderen) geen of zeer weinig uranisten voorkomen. De meeste uranisten komen te midden van een familie van gewone broeders en zusters te voorschijn en in de meeste gevallen is er geen familielid aan te wijzen, bij wien men dezelfde of een dergelijke afwijking kan vinden. De meeste uranisten nu krijgen geen kinderen, omdat zij niet trouwen. En wat dien levensstrijd aangaat, ik geloof niet dat iemand zal durven beweren, dat mannen als Frederik de Groote, Condé, Mac Donald, Krupp en anderen de bewijzen hebben gegeven, dat zij de voorwaarden om den levensstrijd vol te houden, onvoldoende hebben verwezenlijkt!

Volkomen waar is het, dat de degeneratie zich niet bij de kinderen in denzelfden vorm als bij de ouders behoeft te openbaren, maar dat de kinderen andere verschijnselen van degeneratie dan de ouders kunnen vertoonen. Vraagt men nu echter, of er in de ascendentie van den uranist zooveel meer en zooveel ernstiger vormen van degeneratie voorkomen, dan in de familie of ascendentie van den heterosexueel, dan moeten wij ontkennend antwoorden. Immers mag men dan pas van de degeneratie van een persoon spreken, wanneer er verschillende ernstige afwijkingen van het normale (s. v. v.) bij hem te vinden zijn en wanneer over 't algemeen zijn geschiktheid om mee te bestaan en zijn plaats in de samenleving te vervullen in hooge mate is getroffen.[63] Door v. Römer is in zijn werk "Het uranisch huisgezin" voldoende en uitstekend aangetoond, dat degeneratie in de ascendentie van uranisten volstrekt niet erger en zwaarder is, dan in die van heterosexueelen. Trouwens ook andere onderzoekers, waaronder Hirschfeld in de eerste plaats, hebben aangetoond, dat bij den uranist van degeneratie in erger mate dan bij den heterosexueel, geen sprake is. Wat mijn eigen onderzoekingen betreft, ben ik tot dezelfde uitkomst als de andere onderzoekers gekomen en heb ik noch in de ascendentie der uranisten die ik heb onderzocht, noch bij de personen zelf, zoo veel of zoo groote degeneratie kunnen vinden, dat ik daaruit het besluit zou durven trekken, dat de uranist per se gedegenereerd is of het slachtoffer van degeneratie in zijn familie zou zijn. Onder al de uranisten die ik heb onderzocht, heb ik maar één gevonden, bij wien een zeer sterk uitgesproken degeneratie was aan te toonen en in wiens familie, zoowel in de directe ascendentie als in de zijliniën een zware belasting waarschijnlijk de schuld was, dat de uranist zelf een immoreel en lichamelijk gedegenereerd individu is geworden. In hoeverre nu zijn uranisme van die degeneratie afhankelijk was, weet ik niet te zeggen en is ook moeilijk aan te toonen.

Mocht dit alles nog niet genoeg bewijzen, dan wil ik daarenboven vermelden, dat--zooals uit verschillende bronnen blijkt--uranisme en homosexualiteit ook bij wilde en primitieve volken voorkomt. Zoowel in "Untrodden fields of anthropology"[64] als in het opstel van Karsch[65] en in het werk van Havelock Ellis[66] vindt men meer of minder uitgebreide mededeelingen daaromtrent. Burton heeft in zijn "Arabian Nights"[67] een gedeelte van de wereldbol afgebakend, welke hij de "sodatic Zone" noemt en die al de volken omvat, bij wie uranisme en homosexualiteit inheemsch is. Het is opmerkelijk, dat in die "sodatic zone", de primitieve en wilde volken de grootste plaats innemen. En men mag en kan toch niet aannemen, dat degeneratie, depravatie en zedebederf bij primitieve en wilde volken even ver zouden zijn voortgeschreden, als in het beschaafde Europa!

De vierde opvatting, dat het uranisme een variëteit is, blijft ons ter bespreking over. Deze opvatting is m. i. de ware en ik zou haast, met een variant op het bekende Fransche woord, willen zeggen: si elle n'existait pas, il faudrait l'inventer, zóó logisch staat de homosexualiteit op de lijn der geslachtsrichting, zóó onweerlegbaar moet zij te vinden en aan te wijzen zijn.

In zijn bekend werk "Oorsprong en bevruchting der bloemen" zegt Hugo de Vries: "het geheele probleem der erfelijkheid draait in hoofdzaak om de vraag naar het aandeel van den vader en de moeder aan de eigenschappen van het individu. De eene eigenschap heeft een mensch van zijn vader, de andere van zijn moeder. Ziedaar het feit. Slechts in schijn is elk mensch ten opzichte van het probleem der erfelijkheid een eenheid. In zijn binnenste is hij een dubbelwezen. Naast elkaar liggen in hem de

erfstukken van zijn vader en van zijn moeder. Nu eens werken zij samen, dan weer werken zij tegen elkaar, nu eens overheerscht het eene, dan weer het andere.... Elk levend wezen, dat door geslachtelijke voortplanting is ontstaan, vereenigt in zich de erfdeelen van zijn ouders. Deze liggen in hem als een mozaïek, wel innig vermengd, maar toch gescheiden.... Alle lichaamskernen zijn dus dubbelkernen, alle geslachtelijk ontstane wezens dubbelwezens, die levenslang hun dubbelen oorsprong verraden en die in bijzondere gevallen dit op een bijzondere en in het oog vallende wijze doen".[68]

Wij hebben gezien, dat de kenmerken van de eene sexe bij de andere sexe kunnen voorkomen. Wij hebben gezien, dat dit zoowel wat de primaire als wat de secundaire geslachtskenmerken betreft, het geval kan zijn en ook dat de psychische eigenaardigheden, die men voor specifiek voor de eene sexe houdt, even goed bij de andere sexe kunnen voorkomen. De psychische eigenschap, de geslachtsrichting, nu kan even goed een wisseling vertoonen en de eigenschap, die in de meeste gevallen specifiek voor den man is, kan bij de vrouw voorkomen even goed als het omgekeerde het geval kan zijn.

Dat de uranist, dat de homosexueel een variëteit is, kan men op de volgende wijze aantoonen. Nemen wij een denkbeeldige lijn en plaatsen wij aan de beide uiteinden daarvan, aan de eene zijde de man met 100% mannelijke eigenschappen--wanneer die bestaat; geen enkele man heeft die 100% mannelijke eigenschappen, omdat in iederen man ook vrouwelijke lichamelijke eigenschappen zijn aan te toonen (de prostata, de rudimenten van de borsten enz.)--aan de andere zijde de vrouw met 100% vrouwelijke eigenschappen--ook weer, wanneer die bestaat; op de vrouw is mutatis mutandis hetzelfde als op den man van toepassing--dan kunnen wij op die lijn de verschillende variëteiten vinden, die al naar gelang den kant van waar wij beginnen, overwegend mannelijke eigenschappen en heel weinig vrouwelijke hebben, of omgekeerd. Zoo voortgaande tot het midden van de lijn, zullen en moeten wij noodzakelijk op dit midden den volkomen hermaphrodiet vinden. Wanneer wij op dezelfde wijze met den heterosexueel en den homosexueel te werk gaan, dan zien wij, dat waar aan het eene einde van de lijn de absolute heterosexueel staat (wanneer deze absolute heterosexualiteit bestaat), aan het andere einde de absolute homosexueel (wanneer deze absolute homosexualiteit bestaat) moet komen. In het midden komt de bisexueel, de zoogenaamde psycho-sexueele hermaphrodiet. Dat er noch een absolute hetero- noch een absolute homosexualiteit bestaat, is te begrijpen. Een individu erft toch van zijn vader en van zijn moeder, van zijn grootvader en van zijn grootmoeder en van de geheele ascendeerende reeks mannen en vrouwen, die aan zijn vorming--door zijn grootouders en zijn ouders heen--hebben deelgenomen. In iederen heterosexueel zit een gedeelte homosexualiteit, al is dat ook nog zoo klein, even goed als er in iederen homosexueel een gedeelte heterosexualiteit is, al is dit ook nog zoo klein. Het zou wonder zijn, wanneer het individu wel in zijn lichamelijke eigenschappen, maar niet in zijn psychische, van de andere sexe in zijn ascendentie zou erven. Of nu in het midden van de lijn de bisexueel staat, die precies evenveel hetero- als homosexualiteit heeft, kan niet met zekerheid gezegd worden. Theoretisch gesproken, moet het zoo zijn. Maar of er een individu bestaat, dat een zoo precies-gedeelde geslachtsrichting bezit, is niet bekend.

Uit dit alles blijkt, dat de uranist een variëteit is, evenals alle individuen variëteiten zijn, dubbelwezens die zoowel de lichamelijke als de psychische eigenschappen van de beide sexen van hun ouders en voorouders in zich dragen. Met deze opvatting, die ik het eerst op het congres voor crimineele anthropologie te Amsterdam verkondigd heb, gaan dan ook de meeste onderzoekers--Hugo de Vries,[69] Näcke,[70] Hirschfeld,[71] Numa Prätorius[72] e. a.--mede. Uit het wezen der variëteit is het dan ook te verklaren, waarom men onder de uranisten die verschillende vormen vindt, die men bij heterosexueelen ook kan aantoonen, maar die meestal aan de aandacht ontsnappen, van ultra-virilen en virilen tot passieven en geëfemineerden toe. Dat deze variëteit is aangeboren zal wel niemand, naar wat wij zooeven hebben besproken, kunnen of willen tegenspreken.

Wat echter nog wel even sterk pleit voor het aangeboren-zijn van de homosexualiteit, zijn de droomen die de uranist heeft. Näcke is de eerste geweest, die gewezen heeft op "die psychologische Bedeutung der Träume", en zegt dan ook, dat de droom een caracteristicum is, waaruit men de psyche van het individu kan diagnosticeeren.[73] Het zou mij te ver voeren om hier ook over de zoogenaamde contrastdroomen te spreken en ik wil deze dan ook buiten bespreking laten. Zoo is het een zekerheid, dat een heterosexueel in zijn verliefde droomen nooit anders dan heterosexueele beelden ziet, een homosexueel nooit anders dan homosexueele; een bisexueel zal daarentegen nu eens heterosexueele, dan weer homosexueele, beelden voor zich zien. Gesteld iemand zou uranist kunnen worden, iemand zou zijn homosexualiteit kunnen verkrijgen, dan zou het uit zijn droomen blijken, dat hij niet de echte uranisten-natuur heeft en zouden zijn droomen niet voortdurend homosexueel, maar of afwisselend homo- en heterosexueel zijn, of alleen heterosexueel, al naar dat dan zijn ware natuur is. Welken uranist men nu naar zijn verliefde droomen vraagt, men zal altijd ten antwoord krijgen, dat zijn droomen--een enkele contrastdroom, als zeldzaamheid en in zeldzame gevallen er buiten gelaten--altijd homosexueel zijn.

Werpen wij een blik terug op de verschillende theorieën, die er over het uranisme bestaan. De opvatting onzedelijkheid, depravatie, ontucht die uranisme ten gevolge kunnen hebben is niet houdbaar en is ook door een ieder, die een ernstige studie van het

onderwerp heeft gemaakt of nog maakt, verlaten. Ook de opvatting, dat het uranisme een uiting is van een ziekelijke stoornis der geestvermogens, is bewezen onwaar te zijn en hij die het eerst den naam "psychopathia sexualis" heeft uitgesproken, is dan ook bereid geweest, zijn foutieve opvatting te bekennen. Door geen enkelen competenten onderzoeker wordt meer instemming met een dergelijke opvatting geuit. Integendeel, allen die een genoegzaam aantal gevallen van uranisme hebben onderzocht, zijn van het tegendeel van een psychopathie overtuigd.

Dit--zoowel als de kwestie der degeneratie--is van het hoogste belang voor de maatschappelijke zijde van het vraagstuk. Gesteld het uranisme zou een psychopathie zijn, gesteld het zou een degeneratie, een gevolg van degeneratie, een teeken van degeneratie zijn, dan zou hierin geen reden mogen gevonden worden om den uranist met verachting te behandelen of hem uit de samenleving te stooten. Is het uranisme een gevolg van stoornis der geestvermogens, dan is er zeker geen reden om hem met verachting, maar eer reden om hem met medelijden te behandelen. Immers dan staat hij gelijk met iederen ongelukkige, die een afwijking op geestelijk gebied vertoont. Zijn psychopathie toch is niet van zijn wil afhankelijk, zij is niet aan hem zelf, aan zijn wil toe te schrijven, hij heeft die integendeel zonder en tegen zijn wil gekregen.

Hetzelfde kan van de degeneratie worden gezegd. Ook die is niet van zijn wil afhankelijk, ook die heeft hij zonder en tegen zijn wil mee ter wereld gebracht. Doch op dat punt is nog iets anders op te merken, wat van het hoogste belang is. Gesteld het uranisme ware inderdaad een degeneratie--en mijnentwege noeme men het zoo, het is alleen een kwestie van woorden--dan nog zou dit, wat de maatschappelijke zijde van het vraagstuk betreft, niets zeggen. Niet alleen, dat "degeneratie" zonder meer, niets zegt, maar die "degeneratie" kan en mag nooit de maatstaf zijn, waarnaar men iemand beoordeelt. Het is alleen, en mag alleen de vraag zijn, hoe die degeneratie, hoe dit "aus der Art schlagen" zich uit! Men is zoo langzamerhand aan het woord "degeneratie" de beteekenis van individueele minderwaardigheid gaan hechten, die ten eenemale verkeerd is. Iemand die gedegenereerd is, "aus der Art schlägt", doordat hij volmaakter, beter is dan het meerendeel, een genie, een buitengewoon iemand, kan en mag men toch niet een minderwaardig individu noemen, omdat hij gedegenereerd is. Een zoogenaamd gedegenereerd iemand toch kan veel beter, veel meer waard zijn dan zijn niet-gedegenereerde evenmensch. Aan de "degeneratie" hebben wij den vooruitgang van de samenleving te danken, het is de schuld en het werk van "gedegenereerden", dat de wereld zoover gekomen is als geschied is. "Der normale Mensch ist langweilig" heeft Möbius gezegd en het zou er heel vreemd en vervelend in onze wereld uitzien, wanneer er geen dégénérés waren geweest en nog waren, geen genieën, geen geleerden, geen kunstenaars. Niettegenstaande of misschien, en waarschijnlijk zelfs, omdat zij gedegenereerd waren, hebben zoovele groote mannen de wereld vooruit gebracht. In het al- of niet-gedegenereerd zijn zonder meer, mag men geen reden tot waardeschatting van het individu vinden!

Zooals iedereen moet men ook den uranist naar zijn karakter, naar zijn eigenschappen beoordeelen en niet uitsluitend naar zijn geslachtsrichting. Amore, more, ore, re, nascuntur amicitiae! De neiging, waardoor hij van heterosexueelen verschilt, namelijk niet voort te planten (in sommige gevallen planten uranisten wèl voort. In alle geval kunnen zij even goed als heterosexueelen voortplanten.) en dit, om zoo te zeggen, willekeurig nalaten, heeft hij met zoovele heterosexueelen, b.v. vrijwillig celibatairen, gemeen. Dit niet-voortplanten nu is, wat den heterosexueel betreft, nooit een reden voor minachting van de zijde zijner medemenschen. De vraag moet en mag alleen zijn welke moreele, welke sociale eigenschappen een individu vertoont en of die eigenschappen, in den ruimsten zin genomen, beter, hooger, gelijk of minder dan de eigenschappen van het meerendeel zijn. Een ander motief is er niet.

Beschouwen wij den uranist zelf nader. Evenmin als men er begrip van heeft of vermoeden kan, dat het aantal uranisten--en het is uit de enquêtes van Hirschfeld bij de studenten aan de technische Hochschule te Berlijn en onder de Berlijnsche metaalarbeiders,[74] alsmede uit de enquête van v. Römer hier te lande[75] bewezen--plus minus 2.3% van het menschenaantal bedraagt, evenmin heeft men een goede voorstelling van den uranist, zooals hij zich in de maatschappij gedraagt, zooals hij in de maatschappij verkeert. Psychisch normaal, of liever volstrekt niet abnormaler dan de heterosexueelen in de samenleving, doet hij even goed als hij zijn werk, denkt hij even als hij, en voelt hij--op geslachtelijk gebied uitgezonderd--als de heterosexueel. Gaat men hun leven na, dan hoort men dat zij meestal te midden van geslachtelijk normale broeders en zusters zijn geboren en opgevoed, dat zij van hun jeugd reeds--sommige vroeger, andere later--neigingen hebben vertoond, verschillend van die van hun broeders, wanneer het jongens zijn, van hun zusters, wanneer het meisjes zijn. Als jongens voelden zij zich meer aangetrokken tot meisjes-bezigheden, tot meisjesvermaken; als meisjes waren zij de trouwe makkers van hun broeders in hun wilde spelen of in hun mannelijke liefhebberijen. Later, soms pas in de puberteit, is het hen meestal tot hun bewustzijn gekomen, dat zij inderdaad anders voelen dan het meerendeel van hun mannelijke vrienden. Merkwaardig is, dat de moeder dikwijls onbewust op de hoogte van zijn aanleg was, en het is niet zeldzaam te hooren, dat wanneer er grappenderwijs over vrijage of trouwen werd gesproken, de moeder de eenige en eerste was, om op te merken, dikwijls zonder dat zij precies wist waarom, dat haar zoon voor een huwelijk niet

geschikt is. Behalve in hun ontwakende geslachtsneiging, verschillen zij in niets van de kameraden van hun leeftijd en alleen is soms hun neiging, zonder dat zij het zelf weten, van invloed op de keuze van het vak waarin zij zich begeven. Vele uranisten toch voelen zich aangetrokken tot het vak van dames-modes, kapper enz., ofschoon volstrekt niet alle mannen, die zich in die takken van bedrijf begeven, uranisten zijn. Andere kiezen een beroep als van hun heterosexueele kameraden en niemand zou vermoeden, dat er in ieder beroep, in ieder ambt, in iedere bediening uranisten worden gevonden, uranisten, die in hun werk, hun denken en in wat zij ten uitvoer brengen, volstrekt niet bij hun heterosexueele ambtgenooten achterstaan. Men ontmoet ze dan ook in alle rangen en standen van de maatschappij en, wanneer ik alleen naga de uranisten die ik ken of die om hulp en raad bij mij zijn gekomen, dan zie ik daaronder geneesheeren, geestelijken, handelsmannen, studenten, arbeiders, rechters en advocaten, in één woord even zoovelen als er ambachten en beroepen, als er standen in de maatschappij zijn.

Wat een eigenaardigheid is, die men bij het meerendeel der uranisten terugvindt, is deze, dat zij bijna allen een tijdlang in hun leven met de gedachte aan suicide hebben rondgeloopen en dat zij langen tijd de diepste verachting en afkeer van zich zelf hebben gehad. Vóór den tijd namelijk, dat zij op de hoogte van hun toestand waren, in de periode toen hun geslachtsgevoel begon te ontwaken, bemerkten zij, dat zij niet waren als hun kameraden, dat zij zich niet tot meisjes en vrouwen voelden aangetrokken, maar bemerkten zij tot hun verbazing en hun schrik dat hun neigingen alleen op jongens en mannen gericht waren. De schok dien zij daardoor ontvingen, bracht hen meestal tot wanhoop en vertwijfeling en--afgaande op wat zij altijd omtrent deze neigingen en omtrent personen met deze neigingen hebben vernomen--hielden zij zich voor de meest abjecte wezens, die zij zich konden voorstellen. Zóó zelfs is hun wanhoop en de diepe verachting die zij voor hun eigen persoon koesterden--vooral wanneer zij bemerkten, dat hun neigingen niet veranderden, welke moeite zij zich ook gaven, hoevele malen zij ook beproefden met vrouwen geslachtelijk te verkeeren in de hoop, dat hun neigingen zouden veranderen, hoezeer zij zich ook, wanneer zij godsdienstig waren, in het gebed verdiepten--dat er voor hen nog één uitweg open leek, namelijk een eind aan hun leven te maken. Inderdaad zijn er van die geheimzinnige zelfmoorden op jeugdigen leeftijd, die aan het uranisme van den persoon moeten toegeschreven worden, evenals zoovele geheimzinnige zelfmoorden op later leeftijd, als indirect gevolg aan het uranisme van den persoon, aan zijn angst dat men zijn afwijking zal ontdekken, moeten worden geweten.

Heeft de jonge uranist het geluk in handen te vallen van een ouderen heterosexueel, die hem van zijn neigingen op de hoogte brengt, dan is hij gered. Hij legt zich neer bij de ellende van zijn toestand en zoekt zooveel mogelijk nog iets van zijn leven te maken. Een lange ellende echter blijft zijn leven toch voor hem. In een voortdurenden angst, dat men zal ontdekken wat en wie hij eigenlijk is, verstoken van het huiselijk geluk, gedoemd om alleen en altijd alleen, zonder liefde, zonder genegenheid rondom zich als die welke hij weet, dat door iedereen veroordeeld wordt, te leven, sleept hij meestal een bestaan door dat hem een last is en waarvan hij zoo spoedig mogelijk hoopt verlost te worden. Heeft hij het geluk gehad, in handen te vallen van een superieur man of van iemand, die zijn leven dragelijk weet te maken door hem andere en nieuwe idealen te scheppen, hem een ander doel voor oogen te houden dan een heterosexueel huisgezin, dan kan hij door zoo iemand gered worden, op het goede pad gehouden en kan door diens invloed, door diens omgang, zijn leven tot een dragelijk en goed leven worden gemaakt. Altijd echter is zijn leven onvolledig, altijd loopt hij rond met het gevoel, dat hij achter is gesteld bij zoovele anderen, altijd toch is de angst in al zijn doen, in heel zijn leven ingeweven, dat een of anderen dag zijn afwijking bekend kan worden en dat hij dan als een outcast voor zijn verder leven zal worden behandeld. Andere uranisten, verwoed en verbitterd door de onbillijke veroordeeling en beoordeeling van den kant van hun medemenschen, worden onverschillig, gooien zich in een leven van débauche en ontucht en verwoesten uit bitterheid en ontmoediging hun bestaan, dat misschien nuttig en goed had kunnen zijn. Andere weer leggen zich bij hun lot neer en leven door, geslagen, vervelend en verveeld, zonder illusie, zonder het uitzicht op iets moois, dat hen het bestaan beter en om te leven waard kan maken.

Dat zoovele uranisten nerveuse klachten hebben, is daarom niet te verwonderen. Steeds in angst dat men hun toestand zal leeren kennen en dat zij uit den omgang der menschen met wie zij verkeeren, zullen worden gestooten, altijd levend onder de bedreiging--wanneer zij wèl iemand, een heterosexueel of een anderen homosexueel hebben gevonden, met wien zij een verbintenis hebben aangeknoopt--dat zij door chantage tot armoede zullen worden uitgezogen of in het publiek zullen worden geschandvlekt, is het zeer goed te begrijpen, dat hun zenuwgestel op den duur geschaad wordt. En ook de moeilijk vol te houden abstinentie, voor hen die sensueel zijn aangelegd, helpt mee.

Gaat men, de geslachtsrichting daargelaten, na welke individuen uranisten zijn, dan komt men tot de overtuiging, dat zij niets meer--wat sommige uranisten graag willen doen gelooven--maar ook niets minder dan heterosexueelen zijn. Men vindt onder hen dezelfde variaties en dezelfde verschillen als onder heterosexueelen, en evenals onder de laatsten, vindt men onder hen goeden en slechten, braven en deugnieten, knappen en dommen, zedelijken en onzedelijken, in één woord alle eigenschappen en

eigenaardigheden, die men bij heterosexueelen vindt, treft men bij uranisten aan.

Wat hun geslachtsleven betreft, daarvan kan men hetzelfde zeggen. Evenals onder heterosexueelen, vindt men onder hen kuischen en onkuischen, koelen en sensueelen, ingetogenen en losbollen. En evenals onder heterosexueelen, vindt men ook onder hen personen met sexueele perversiteiten behebt: masochisten, sadisten, exhibitionisten en dergelijke meer. Eén eigenschap hebben zij im Allgemeinen voor boven heterosexueelen, namelijk dat men onder hen veel meer spiritueele liefdesverhoudingen vindt. Over het algemeen vindt men meer kuische, koele individuen onder uranisten dan onder heterosexueelen en treft men onder hen veel meer, dat hun liefdeverbintenis een meer spiritueele dan een corporeele is. Het is geen zeldzaamheid dat twee uranisten jarenlang met elkaar in een liefdesverhouding staan, zonder dat het tusschen hen tot een geslachtsuiting komt. En ook hebben zij boven heterosexueelen voor, dat over het algemeen hun omgang veel kiescher, veel gevoeliger, veel zachter is.

Toen ik weinige jaren geleden, voor mijn studie over het uranisme, eenigen tijd te Berlijn doorbracht, heb ik daar als lid van het Wissensch.-humanitär Comitée een openbare vergadering bijgewoond, waar Hirschfeld over het onderwerp sprak. Behalve door een groote menigte heterosexueelen, werd de vergadering natuurlijk door ettelijke honderdtallen homosexueelen bijgewoond. Dat er gedurende en op die vergadering geen enkel onvertogen woord viel, is niet te verwonderen. Maar toen ik daarna een van de beroemde homosexueele gecostumeerde bals bezocht, trof het mij, dat geen enkel onvertogen woord mijn ooren bereikte, trof het mij, dat ik geen enkel ongeoorloofd gebaar zag. En er waren daar zoowel uranisten, als mannelijke prostitués. Den volgenden dag woonde ik een vergadering van het Comitée bij, terwijl ik na afloop daarvan op een souper genoodigd was, dat meestal na die bijeenkomsten wordt gehouden. Ook daar, waar Hirschfeld en ik de eenige heterosexueelen waren, was de toon hoogst fatsoenlijk en de gesprekken van dien aard, dat niemand, zelfs de meest puriteinsche moralist, er aanstoot in zou hebben kunnen vinden. Ik ben in die dagen te Berlijn den geheelen dag in gezelschap van uranisten geweest, ik heb er gelegenheden bezocht waar de mannelijke basse prostitution zetelde. En toen ik in op den laatsten avond van mijn verblijf met den duitschen homosexueelen geneesheer, die ergens in Italië praktiseert, na ons laatste bezoek aan een kroegje van zeer laag allooi, liep te praten in de reeds stille straten van Berlijn en wij van gedachten wisselden over het uranisme en het heterosexueel geslachtsleven, toen moest ik volmondig bekennen, dat--zoolang ik in de afgeloopen dagen in Berlijn had gezworven, met hoeveel uranisten ik ook had omgegaan in dien betrekkelijk korten tijd, welke gesprekken ik ook had hooren voeren en had bijgewoond--hun toon den toon van heterosexueele mannen verre overtrof in kuischheid van taal en uitdrukking en dat er nergens en nooit op heterosexueele publieke gemaskerde bals, nooit in gelegenheden waar door zoogenaamde kellnerinnen werd bediend, een ingetogenheid van woorden en van doen--zooals mij door verschillende weters op dat heterosexueel gebied was meegedeeld--werd aangetroffen, als waarvan ik in die dagen onder uranisten getuige was geweest. Nergens en nergens, door niemand en niemand, heb ik één enkele uitdrukking hooren bezigen, die ongepast was en met volle overtuiging kan ik dan ook zeggen, dat de toon der gesprekken van al deze uranisten, dat de toon der gesprekken aan tafel en na het souper hemelsbreed verschilde van den toon dien men op heterosexueele heerendineetjes hoort en van de gesprekken, die heterosexueele heeren na het diner meestal gewoon zijn met elkaar te houden.

Dat deze meening niet op vooringenomenheid of op een onrechtvaardig oordeel berust, bleek mij korten tijd daarna, toen ik een opstel over de Berlijnsche homosexueelen van de hand van Näcke in het Archiv van Gross las.[76] Näcke heeft dezelfde personen ten naastenbij gesproken, met wie ik kennis had gemaakt, ik kon sommigen zeer goed uit zijn beschrijving herkennen; Näcke heeft ten naastenbij dezelfde gelegenheden bezocht als waar ik ben geweest en de conclusie van Näcke komt zoo goed met de mijne overeen, dat het den indruk zou kunnen maken, dat wij dien van elkaar hebben overgeschreven!

Vraagt men nu of er een middel is om den uranist te "genezen", om hem te veranderen en hem van homosexueel, heterosexueel te maken, dan moeten wij volmondig "neen" antwoorden. Men heeft voorgesteld hen te castreeren en sommige uranisten hebben er om gevraagd, om maar van hun onsociale neiging verlost te worden. Men heeft het gelukkigerwijs nooit gedaan, omdat het toch niet zou helpen. De geslachtsrichting zit niet in de teeltklieren, maar in de psyche. Men heeft voorgesteld--en v. Schrenck-Notzing is er een der voorstanders van--om ze te hypnotiseeren en hen suggestief te behandelen. Het heeft niet mogen baten en van de vijf gevallen, die door v. Schrenck-Notzing als genezen worden opgegeven, zijn er maar twee die op een wijze zijn genezen, dat men het geen genezing mag noemen. De eene patient zegt, dat hij nog dezelfde fantaisieën heeft als vroeger, maar dat hij--wanneer hij wakker is--macht genoeg over zich zelf heeft om er niet aan toe te geven. Daarbij denkt hij er met vrees aan, wat hij zou moeten beginnen, wanneer zijn vrouw eens zou komen te overlijden, omdat hij zeker is, dat hij dan weer in zijn oud kwaad zou vervallen. De tweede zoogenaamde genezen patient zegt, dat wanneer hij zich een tijdlang geabstineerd heeft, hij zijn oude aanvechtingen weer voelt opkomen.[77] Maar zelfs wanneer al de gevallen, die door met hypnose zijn behandeld, zoogenaamd genezen zouden

zijn, dan nog zou men niet het recht hebben van "genezing" te spreken, omdat--zooals v. Krafft-Ebing te recht opmerkt--"de resultaten der hypnose in deze gevallen niet op een werkelijke genezing, maar op een kunstig volvoerde dressuur berusten"[78]. Men zou op dezelfde wijze er van kunnen spreken, dat men iemand homosexueel heeft gemaakt, wanneer men hem door hypnose en suggestie er op gedresseerd had, zijn heterosexueele geslachtsuiting onmogelijk te kunnen volvoeren, maar hem daarentegen het doen van homosexueele geslachtsdaden had ingepraat. Iemand nu die homosexueele geslachtsdaden doet, hebben wij gezien, is daarom nog geen uranist en evenmin kan iemand die door hypnose en suggestie er toe gebracht is, om in plaats van homosexueele, heterosexueele geslachtsdaden te doen, als heterosexueel aangemerkt worden.

Men heeft uranisten den raad gegeven--en sommige geneesheeren, niet genoeg of in het geheel niet op de hoogte van het onderwerp, geven dien raad nog--om zich eerst bij prostitués te oefenen in het heterosexueel geslachtsverkeer en dan te trouwen, of dadelijk te trouwen, in de verwachting, dat de homosexualiteit dan wel zal overgaan. Het immoreele van een dergelijken raad daargelaten, is deze de meest verkeerde dien men een uranist kan geven. Niet alleen maakt men hem zelf ongelukkig, door de wroeging die hij later voelt, een vrouw aan zijn bestaan te hebben gebonden, waarin zijn ware natuur toch--niettegenstaande alle pogingen om heterosexueel te verkeeren--boven komt, maar men maakt zijn vrouw ook diep ongelukkig, doordat zij er onder gebukt moèt gaan, wanneer zij op de hoogte is gekomen van den toestand van haar echtgenoot--zelfs al vergeeft zij hem en houdt zij nog meer van hem omdat hij ongelukkig is (alleen een vrouw voelt zóó teer en zacht, dat er bij haar altijd vergeving en liefde is te vinden in zoo'n geval)--en zij haar verder leven voor zich ziet in één groote desillusie, wetend, dat zij zich geen huisgezin kan scheppen, voelend, dat haar dat eene groote en mooie in haar leven zal blijven ontbreken, de echte, ware liefde van haar man!

Genezing is er niet voor den uranist, omdat hij niet ziek is. Hem den last wegnemen, dien hij bij zijn geboorte heeft meegebracht en die met hem zal blijven tot aan zijn dood, kunnen wij niet. Het eenige wat wij kunnen, is hem trachten te begrijpen, hem trachten te helpen, trachten hem zijn moeilijk leven gemakkelijker te maken.

Er zijn er die vreezen, dat wanneer de theorie die ik heb meegedeeld--namelijk, dat de uranist een variëteit is--in ruimen kring bekend wordt, geen enkele uranist zich meer zal intoomen en dat ieder uranist zich maar aan zijn geslachtslust zal te buiten gaan, dat velen die op het oogenblik uit angst voor de verachting der menschen hun lusten intoomen, aan hun lusten den vrijen teugel zullen vieren. Maar bovenal vreest men, dat velen door de openbaarmaking van deze theorie uranist zullen worden.

Het laatste het eerst besprekend, weten wij, dat dit geen gewichtig argument is. Wij zijn nu genoegzaam overtuigd geworden en het is door de competente onderzoekers genoegzaam aangetoond, dat uranisme altijd is aangeboren en dat uranisme niet kan worden verkregen. Wat de andere opmerkingen betreft, vragen wij daartegenover of er zooveel menschen zich aan drinken zijn te buiten gegaan, sinds er verkondigd is, dat drankzucht een ziekte en niet altijd een bederf der zeden is, of er zooveel menschen zich aan de prostitutie zijn gaan overgeven, omdat men openlijk heeft verkondigd, dat de prostitutie een kwaad is, dat in de samenleving is ingeweven, en dat, onder welken verschillenden vorm dan ook, van den aanvang der samenleving af tot den huidigen dag bestaan heeft. En ook staat tegenover deze vrees het feit, dat niettegenstaande reeds eeuwen lang het uranisme met verachting is beschouwd, de uranist met minachting is behandeld, er toch altijd door uranisten geboren zijn en geleefd hebben, er steeds door homosexueele daden door uranisten zijn gepleegd en nog steeds gepleegd worden. Nooit nog heeft de afkeuring van de massa een uranist teruggehouden van zijn uranisme of belet, dat er uranisten werden geboren. Die minachting en verachting hebben alleen belet, dat de uranist openlijk voor zijn uranisme uitkwam. Zij heeft echter daarbij tevens chantage, wanhoop en zelfmoord in de hand gewerkt! Waarom, wanneer de opvatting, dat het uranisme een variëteit is, in ruimen kring bekend zal zijn, geen enkele uranist meer zijn lusten zal remmen, is mij onbegrijpelijk! Geven heterosexueelen dan maar allen toe aan hun lusten en breidelen zij hun sexueele lusten niet, omdat heterosexualiteit als een normale geslachtsrichting bekend staat en overal en steeds zoo genoemd wordt? Waarom, waar de heterosexueel zijn lusten intoomt, terwijl het hem bekend is dat zijn geslachtsrichting een normale is, de uranist de zijne niet zou intoomen, wanneer men erkent dat hij een variëteit is, is moeilijk te verdedigen.

Deze en dergelijke meeningen zijn alleen het gevolg van de verkeerde gedachte, dat uranisten en homosexueelen per se gedepraveerde en ultra-sensueele individuen zijn. Wij hebben genoegzaam aangetoond, dat dit niet zoo is, maar dat men integendeel veel meer spiritueele dan corporeele liefdegevoelens bij hen aantreft.

Nogmaals, genezen kunnen wij ze niet, wij kunnen alleen trachten ze te helpen. Niet hen verstooten, niet hen verachten moeten wij, niet hen behandelen als paria's om iets dat zij bij hun geboorte en zonder hun wil hebben meegekregen. Men weet niet hoeveel er gestreden, geschreid, hoeveel er gewanhoopt, hoeveel er geleden wordt! Uit de voorbeelden die ik heb genoemd, is duidelijk genoeg gebleken, dat de uranist even goed als de heterosexueel zijn plaats in de samenleving kan innemen; uit die voorbeelden is ook gebleken, dat hij die plaats met eere kan vervullen als artiest, als wetenschappelijk man, in één woord, als werker. Hem er op

te wijzen, dat de geslachtsdaad--en zelfs niet de heterosexueele geslachtsdaad--niet het eenige, het einddoel, het hoogste in het bestaan is; hem er op te wijzen, dat hij zich boven zijn geslachtsleven moet stellen, dat hij zijn lusten moet remmen, even goed als wij allen, dat hij door zijn voelen, door zijn denken, door zijn werken een ander doel zich kan scheppen tot nut en heil van zijn medemenschen, moet ons streven zijn.

Maar bij dit alles moeten wij nooit vergeten, dat waar wij allen--hetero- en homosexueelen--den last van het leven moeten dragen, wij heterosexueelen altijd dàt geluk vóór hebben, dat wij--wanneer wij moe en gekwetst zijn van het worstelen in de maatschappij en het botsen tegen de onverschilligheid en de hardheid van de menschen--altijd een vrouw kunnen vinden bij wie wij ons hoofd kunnen neerrusten in haar schoot, een vrouw die ons kan helpen, steunen en ons troosten; wij mogen en moeten nooit vergeten, dat waar wij dat hoogste en dat mooiste bezitten, dat eenige wat het leven dragelijk maakt, dat eenige wat het leven waard maakt om gedragen te worden, dat hen dat steeds ontbreken blijft, dat zij dat blijven missen tot hun dood.

Wij moeten en mogen nooit vergeten, dat zij zooveel ongelukkiger zijn.

Ik heb gezegd.

PREFACE

The following lectures[1] are an attempt to show, by means of examples, the nature, capacity, and limitations of the logical-analytic method in philosophy. This method, of which the first complete example is to be found in the writings of Frege, has gradually, in the course of actual research, increasingly forced itself upon me as something perfectly definite, capable of embodiment in maxims, and adequate, in all branches of philosophy, to yield whatever objective scientific knowledge it is possible to obtain. Most of the methods hitherto practised have professed to lead to more ambitious results than any that logical analysis can claim to reach, but unfortunately these results have always been such as many competent philosophers considered inadmissible. Regarded merely as hypotheses and as aids to imagination, the great systems of the past serve a very useful purpose, and are abundantly worthy of study. But something different is required if philosophy is to become a science, and to aim at results independent of the tastes and temperament of the philosopher who advocates them. In what follows, I have endeavoured to show, however imperfectly, the way by which I believe that this _desideratum_ is to be found.

[1] Delivered as Lowell Lectures in Boston, in March and April 1914.

The central problem by which I have sought to illustrate method is the problem of the relation between the crude data of sense and the space, time, and matter of mathematical physics. I have been made aware of the importance of this problem by my friend and collaborator Dr Whitehead, to whom are due almost all the differences between the views advocated here and those suggested in _The Problems of Philosophy_.[2] I owe to him the definition of points, the suggestion for the treatment of instants and "things," and the whole conception of the world of physics as a _construction_ rather than an _inference_. What is said on these topics here is, in fact, a rough preliminary account of the more precise results which he is giving in the fourth volume of our _Principia Mathematica_.[3] It will be seen that if his way of dealing with these topics is capable of being successfully carried through, a wholly new light is thrown on the time-honoured controversies of realists and idealists, and a method is obtained of solving all that is soluble in their problem.

[2] London and New York, 1912 ("Home University Library").

[3] The first volume was published at Cambridge in 1910, the second in 1912, and the third in 1913.

The speculations of the past as to the reality or unreality of the world of physics were baffled, at the outset, by the absence of any satisfactory theory of the mathematical infinite. This difficulty has been removed by the work of Georg Cantor. But the positive and detailed solution of the problem by means of mathematical constructions based upon sensible objects as data has only been rendered possible by the growth of mathematical logic, without which it is practically impossible to manipulate ideas of the requisite abstractness and complexity. This aspect, which is somewhat obscured in a merely popular outline such as is contained in the following lectures, will become plain as soon as Dr Whitehead's work is published. In pure logic, which, however, will be very briefly discussed in these lectures, I have had the benefit of vitally important discoveries, not yet published, by my friend Mr Ludwig Wittgenstein.

Since my purpose was to illustrate method, I have included much that is tentative and incomplete, for it is not by the study of finished structures alone that the manner of construction can be learnt. Except in regard to such matters as Cantor's theory of infinity, no finality is claimed for the theories suggested; but I believe that where they are found to require modification, this will be discovered by substantially the same method as that which at present makes them appear probable, and it is on this ground that I ask the reader to be tolerant of their incompleteness.

Cambridge, June 1914.

LECTURE I

CURRENT TENDENCIES

Philosophy, from the earliest times, has made greater claims, and achieved fewer results, than any other branch of learning. Ever since Thales said that all is water, philosophers have been ready with glib assertions about the sum-total of things; and equally glib

denials have come from other philosophers ever since Thales was contradicted by Anaximander. I believe that the time has now arrived when this unsatisfactory state of things can be brought to an end. In the following course of lectures I shall try, chiefly by taking certain special problems as examples, to indicate wherein the claims of philosophers have been excessive, and why their achievements have not been greater. The problems and the method of philosophy have, I believe, been misconceived by all schools, many of its traditional problems being insoluble with our means of knowledge, while other more neglected but not less important problems can, by a more patient and more adequate method, be solved with all the precision and certainty to which the most advanced sciences have attained.

Among present-day philosophies, we may distinguish three principal types, often combined in varying proportions by a single philosopher, but in essence and tendency distinct. The first of these, which I shall call the classical tradition, descends in the main from Kant and Hegel; it represents the attempt to adapt to present needs the methods and results of the great constructive philosophers from Plato downwards. The second type, which may be called evolutionism, derived its predominance from Darwin, and must be reckoned as having had Herbert Spencer for its first philosophical representative; but in recent times it has become, chiefly through William James and M. Bergson, far bolder and far more searching in its innovations than it was in the hands of Herbert Spencer. The third type, which may be called "logical atomism" for want of a better name, has gradually crept into philosophy through the critical scrutiny of mathematics. This type of philosophy, which is the one that I wish to advocate, has not as yet many whole-hearted adherents, but the "new realism" which owes its inception to Harvard is very largely impregnated with its spirit. It represents, I believe, the same kind of advance as was introduced into physics by Galileo: the substitution of piecemeal, detailed, and verifiable results for large untested generalities recommended only by a certain appeal to imagination. But before we can understand the changes advocated by this new philosophy, we must briefly examine and criticise the other two types with which it has to contend.

A. The Classical Tradition

Twenty years ago, the classical tradition, having vanquished the opposing tradition of the English empiricists, held almost unquestioned sway in all Anglo-Saxon universities. At the present day, though it is losing ground, many of the most prominent teachers still adhere to it. In academic France, in spite of M. Bergson, it is far stronger than all its opponents combined; and in Germany it has many vigorous advocates. Nevertheless, it represents on the whole a decaying force, and it has failed to adapt itself to the temper of the age. Its advocates are, in the main, those whose extra-philosophical knowledge is literary, rather than those who have felt the inspiration of science. There are, apart from reasoned arguments, certain general intellectual forces against it--the same general forces which are breaking down the other great syntheses of the past, and making our age one of bewildered groping where our ancestors walked in the clear daylight of unquestioning certainty.

The original impulse out of which the classical tradition developed was the naive faith of the Greek philosophers in the omnipotence of reasoning. The discovery of geometry had intoxicated them, and its _a priori_ deductive method appeared capable of universal application. They would prove, for instance, that all reality is one, that there is no such thing as change, that the world of sense is a world of mere illusion; and the strangeness of their results gave them no qualms because they believed in the correctness of their reasoning. Thus it came to be thought that by mere thinking the most surprising and important truths concerning the whole of reality could be established with a certainty which no contrary observations could shake. As the vital impulse of the early philosophers died away, its place was taken by authority and tradition, reinforced, in the Middle Ages and almost to our own day, by systematic theology. Modern philosophy, from Descartes onwards, though not bound by authority like that of the Middle Ages, still accepted more or less uncritically the Aristotelian logic. Moreover, it still believed, except in Great Britain, that _a priori_ reasoning could reveal otherwise undiscoverable secrets about the universe, and could prove reality to be quite different from what, to direct observation, it appears to be. It is this belief, rather than any particular tenets resulting from it, that I regard as the distinguishing characteristic of the classical tradition, and as hitherto the main obstacle to a scientific attitude in philosophy.

The nature of the philosophy embodied in the classical tradition may be made clearer by taking a particular exponent as an illustration. For this purpose, let us consider for a moment the doctrines of Mr Bradley, who is probably the most distinguished living representative of this school. Mr Bradley's _Appearance and Reality_ is a book consisting of two parts, the first called _Appearance_, the second _Reality_. The first part examines and condemns almost all that makes up our everyday world: things and qualities, relations, space and time, change, causation, activity, the self. All these, though in some sense facts which qualify reality, are not real as they appear. What is real is one single, indivisible, timeless whole, called the Absolute, which is in some sense spiritual, but does not consist of souls, or of thought and will as we know them. And all this is established by abstract logical

reasoning professing to find self-contradictions in the categories condemned as mere appearance, and to leave no tenable alternative to the kind of Absolute which is finally affirmed to be real.

One brief example may suffice to illustrate Mr Bradley's method. The world appears to be full of many things with various relations to each other--right and left, before and after, father and son, and so on. But relations, according to Mr Bradley, are found on examination to be self-contradictory and therefore impossible. He first argues that, if there are relations, there must be qualities between which they hold. This part of his argument need not detain us. He then proceeds:

"But how the relation can stand to the qualities is, on the other side, unintelligible. If it is nothing to the qualities, then they are not related at all; and, if so, as we saw, they have ceased to be qualities, and their relation is a nonentity. But if it is to be something to them, then clearly we shall require a _new_ connecting relation. For the relation hardly can be the mere adjective of one or both of its terms; or, at least, as such it seems indefensible. And, being something itself, if it does not itself bear a relation to the terms, in what intelligible way will it succeed in being anything to them? But here again we are hurried off into the eddy of a hopeless process, since we are forced to go on finding new relations without end. The links are united by a link, and this bond of union is a link which also has two ends; and these require each a fresh link to connect them with the old. The problem is to find how the relation can stand to its qualities, and this problem is insoluble."[4]

[4] _Appearance and Reality_, pp. 32-33.

I do not propose to examine this argument in detail, or to show the exact points where, in my opinion, it is fallacious. I have quoted it only as an example of method. Most people will admit, I think, that it is calculated to produce bewilderment rather than conviction, because there is more likelihood of error in a very subtle, abstract, and difficult argument than in so patent a fact as the interrelatedness of the things in the world. To the early Greeks, to whom geometry was practically the only known science, it was possible to follow reasoning with assent even when it led to the strangest conclusions. But to us, with our methods of experiment and observation, our knowledge of the long history of _a priori_ errors refuted by empirical science, it has become natural to suspect a fallacy in any deduction of which the conclusion appears to contradict patent facts. It is easy to carry such suspicion too far, and it is very desirable, if possible, actually to discover the exact nature of the error when it exists. But there is no doubt that what we may call the empirical outlook has become part of most educated people's habit of mind; and it is this, rather than any definite argument, that has diminished the hold of the classical tradition upon students of philosophy and the instructed public generally.

The function of logic in philosophy, as I shall try to show at a later stage, is all-important; but I do not think its function is that which it has in the classical tradition. In that tradition, logic becomes constructive through negation. Where a number of alternatives seem, at first sight, to be equally possible, logic is made to condemn all of them except one, and that one is then pronounced to be realised in the actual world. Thus the world is constructed by means of logic, with little or no appeal to concrete experience. The true function of logic is, in my opinion, exactly the opposite of this. As applied to matters of experience, it is analytic rather than constructive; taken _a priori_, it shows the possibility of hitherto unsuspected alternatives more often than the impossibility of alternatives which seemed _prima facie_ possible. Thus, while it liberates imagination as to what the world _may_ be, it refuses to legislate as to what the world _is_. This change, which has been brought about by an internal revolution in logic, has swept away the ambitious constructions of traditional metaphysics, even for those whose faith in logic is greatest; while to the many who regard logic as a chimera the paradoxical systems to which it has given rise do not seem worthy even of refutation. Thus on all sides these systems have ceased to attract, and even the philosophical world tends more and more to pass them by.

One or two of the favourite doctrines of the school we are considering may be mentioned to illustrate the nature of its claims. The universe, it tells us, is an "organic unity," like an animal or a perfect work of art. By this it means, roughly speaking, that all the different parts fit together and co-operate, and are what they are because of their place in the whole. This belief is sometimes advanced dogmatically, while at other times it is defended by certain logical arguments. If it is true, every part of the universe is a microcosm, a miniature reflection of the whole. If we knew ourselves thoroughly, according to this doctrine, we should know everything. Common sense would naturally object that there are people--say in China--with whom our relations are so indirect and trivial that we cannot infer anything important as to them from any fact about ourselves. If there are living beings in Mars or in more distant parts of the universe, the same argument becomes even stronger. But further, perhaps the whole contents of the space and time in which we live form only one of many universes, each seeming to itself complete. And thus the conception of the necessary unity of all that is resolves itself into the poverty of imagination, and a freer logic emancipates us from the strait-waistcoated benevolent institution which idealism palms off as the totality of being.

Another very important doctrine held by most, though not all, of the school we are examining is the doctrine that all reality is what is called "mental" or "spiritual," or that, at any rate, all reality is dependent for its existence upon what is mental. This view is often particularised into the form which states that the relation of knower and known is fundamental, and that nothing can exist unless it either knows or is known. Here again the same legislative function is ascribed to _a priori_ argumentation: it is thought that there are contradictions in an unknown reality. Again, if I am not mistaken, the argument is fallacious, and a better logic will show that no limits can be set to the extent and nature of the unknown. And when I speak of the unknown, I do not mean merely what we personally do not know, but what is not known to any mind. Here as elsewhere, while the older logic shut out possibilities and imprisoned imagination within the walls of the familiar, the newer logic shows rather what may happen, and refuses to decide as to what _must_ happen.

The classical tradition in philosophy is the last surviving child of two very diverse parents: the Greek belief in reason, and the mediaeval belief in the tidiness of the universe. To the schoolmen, who lived amid wars, massacres, and pestilences, nothing appeared so delightful as safety and order. In their idealising dreams, it was safety and order that they sought: the universe of Thomas Aquinas or Dante is as small and neat as a Dutch interior. To us, to whom safety has become monotony, to whom the primeval savageries of nature are so remote as to become a mere pleasing condiment to our ordered routine, the world of dreams is very different from what it was amid the wars of Guelf and Ghibelline. Hence William James's protest against what he calls the "block universe" of the classical tradition; hence Nietzsche's worship of force; hence the verbal bloodthirstiness of many quiet literary men. The barbaric substratum of human nature, unsatisfied in action, finds an outlet in imagination. In philosophy, as elsewhere, this tendency is visible; and it is this, rather than formal argument, that has thrust aside the classical tradition for a philosophy which fancies itself more virile and more vital.

B. Evolutionism

Evolutionism, in one form or another, is the prevailing creed of our time. It dominates our politics, our literature, and not least our philosophy. Nietzsche, pragmatism, Bergson, are phases in its philosophic development, and their popularity far beyond the circles of professional philosophers shows its consonance with the spirit of the age. It believes itself firmly based on science, a liberator of hopes, an inspirer of an invigorating faith in human power, a sure antidote to the ratiocinative authority of the Greeks and the dogmatic authority of mediaeval systems. Against so fashionable and so agreeable a creed it may seem useless to raise a protest; and with much of its spirit every modern man must be in sympathy. But I think that, in the intoxication of a quick success, much that is important and vital to a true understanding of the universe has been forgotten. Something of Hellenism must be combined with the new spirit before it can emerge from the ardour of youth into the wisdom of manhood. And it is time to remember that biology is neither the only science, nor yet the model to which all other sciences must adapt themselves. Evolutionism, as I shall try to show, is not a truly scientific philosophy, either in its method or in the problems which it considers. The true scientific philosophy is something more arduous and more aloof, appealing to less mundane hopes, and requiring a severer discipline for its successful practice.

Darwin's _Origin of Species_ persuaded the world that the difference between different species of animals and plants is not the fixed, immutable difference that it appears to be. The doctrine of natural kinds, which had rendered classification easy and definite, which was enshrined in the Aristotelian tradition, and protected by its supposed necessity for orthodox dogma, was suddenly swept away for ever out of the biological world. The difference between man and the lower animals, which to our human conceit appears enormous, was shown to be a gradual achievement, involving intermediate beings who could not with certainty be placed either within or without the human family. The sun and planets had already been shown by Laplace to be very probably derived from a primitive more or less undifferentiated nebula. Thus the old fixed landmarks became wavering and indistinct, and all sharp outlines were blurred. Things and species lost their boundaries, and none could say where they began or where they ended.

But if human conceit was staggered for a moment by its kinship with the ape, it soon found a way to reassert itself, and that way is the "philosophy" of evolution. A process which led from the amoeba to man appeared to the philosophers to be obviously a progress--though whether the amoeba would agree with this opinion is not known. Hence the cycle of changes which science had shown to be the probable history of the past was welcomed as revealing a law of development towards good in the universe--an evolution or unfolding of an ideal slowly embodying itself in the actual. But such a view, though it might satisfy Spencer and those whom we may call Hegelian evolutionists, could not be accepted as adequate by the more whole-hearted votaries of change. An ideal to which the world continuously approaches is, to these minds, too dead and static to be inspiring. Not only the aspirations, but the ideal too, must change and develop with the course of evolution; there must be no fixed goal, but a continual fashioning of

fresh needs by the impulse which is life and which alone gives unity to the process.

Ever since the seventeenth century, those whom William James described as the "tender-minded" have been engaged in a desperate struggle with the mechanical view of the course of nature which physical science seems to impose. A great part of the attractiveness of the classical tradition was due to the partial escape from mechanism which it provided. But now, with the influence of biology, the "tender-minded" believe that a more radical escape is possible, sweeping aside not merely the laws of physics, but the whole apparently immutable apparatus of logic, with its fixed concepts, its general principles, and its reasonings which seem able to compel even the most unwilling assent. The older kind of teleology, therefore, which regarded the End as a fixed goal, already partially visible, towards which we were gradually approaching, is rejected by M. Bergson as not allowing enough for the absolute dominion of change. After explaining why he does not accept mechanism, he proceeds:[5]

"But radical finalism is quite as unacceptable, and for the same reason. The doctrine of teleology, in its extreme form, as we find it in Leibniz for example, implies that things and beings merely realise a programme previously arranged. But if there is nothing unforeseen, no invention or creation in the universe, time is useless again. As in the mechanistic hypothesis, here again it is supposed that _all is given_. Finalism thus understood is only inverted mechanism. It springs from the same postulate, with this sole difference, that in the movement of our finite intellects along successive things, whose successiveness is reduced to a mere appearance, it holds in front of us the light with which it claims to guide us, instead of putting it behind. It substitutes the attraction of the future for the impulsion of the past. But succession remains none the less a mere appearance, as indeed does movement itself. In the doctrine of Leibniz, time is reduced to a confused perception, relative to the human standpoint, a perception which would vanish, like a rising mist, for a mind seated at the centre of things.

"Yet finalism is not, like mechanism, a doctrine with fixed rigid outlines. It admits of as many inflections as we like. The mechanistic philosophy is to be taken or left: it must be left if the least grain of dust, by straying from the path foreseen by mechanics, should show the slightest trace of spontaneity. The doctrine of final causes, on the contrary, will never be definitively refuted. If one form of it be put aside, it will take another. Its principle, which is essentially psychological, is very flexible. It is so extensible, and thereby so comprehensive, that one accepts something of it as soon as one rejects pure mechanism. The theory we shall put forward in this book will therefore necessarily partake of finalism to a certain extent."

[5] _Creative Evolution_, English translation, p. 41.

M. Bergson's form of finalism depends upon his conception of life. Life, in his philosophy, is a continuous stream, in which all divisions are artificial and unreal. Separate things, beginnings and endings, are mere convenient fictions: there is only smooth, unbroken transition. The beliefs of to-day may count as true to-day, if they carry us along the stream; but to-morrow they will be false, and must be replaced by new beliefs to meet the new situation. All our thinking consists of convenient fictions, imaginary congealings of the stream: reality flows on in spite of all our fictions, and though it can be lived, it cannot be conceived in thought. Somehow, without explicit statement, the assurance is slipped in that the future, though we cannot foresee it, will be better than the past or the present: the reader is like the child who expects a sweet because it has been told to open its mouth and shut its eyes. Logic, mathematics, physics disappear in this philosophy, because they are too "static"; what is real is an impulse and movement towards a goal which, like the rainbow, recedes as we advance, and makes every place different when we reach it from what it appeared to be at a distance.

Now I do not propose at present to enter upon a technical examination of this philosophy. At present I wish to make only two criticisms of it--first, that its truth does not follow from what science has rendered probable concerning the facts of evolution, and secondly, that the motives and interests which inspire it are so exclusively practical, and the problems with which it deals are so special, that it can hardly be regarded as really touching any of the questions that to my mind constitute genuine philosophy.

(1) What biology has rendered probable is that the diverse species arose by adaptation from a less differentiated ancestry. This fact is in itself exceedingly interesting, but it is not the kind of fact from which philosophical consequences follow. Philosophy is general, and takes an impartial interest in all that exists. The changes suffered by minute portions of matter on the earth's surface are very important to us as active sentient beings; but to us as philosophers they have no greater interest than other changes in portions of matter elsewhere. And if the changes on the earth's surface during the last few millions of years appear to our present ethical notions to be in the nature of a progress, that gives no ground for believing that progress is a general law of the universe. Except under the influence of desire, no one would admit for a moment so crude a generalisation from such a tiny selection of facts. What does result, not specially from biology, but from all the sciences which deal with what exists, is that we cannot understand the world

unless we can understand change and continuity. This is even more evident in physics than it is in biology. But the analysis of change and continuity is not a problem upon which either physics or biology throws any light: it is a problem of a new kind, belonging to a different kind of study. The question whether evolutionism offers a true or a false answer to this problem is not, therefore, a question to be solved by appeals to particular facts, such as biology and physics reveal. In assuming dogmatically a certain answer to this question, evolutionism ceases to be scientific, yet it is only in touching on this question that evolutionism reaches the subject-matter of philosophy. Evolutionism thus consists of two parts: one not philosophical, but only a hasty generalisation of the kind which the special sciences might hereafter confirm or confute; the other not scientific, but a mere unsupported dogma, belonging to philosophy by its subject-matter, but in no way deducible from the facts upon which evolution relies.

(2) The predominant interest of evolutionism is in the question of human destiny, or at least of the destiny of Life. It is more interested in morality and happiness than in knowledge for its own sake. It must be admitted that the same may be said of many other philosophies, and that a desire for the kind of knowledge which philosophy really can give is very rare. But if philosophy is to become scientific--and it is our object to discover how this can be achieved--it is necessary first and foremost that philosophers should acquire the disinterested intellectual curiosity which characterises the genuine man of science. Knowledge concerning the future--which is the kind of knowledge that must be sought if we are to know about human destiny--is possible within certain narrow limits. It is impossible to say how much the limits may be enlarged with the progress of science. But what is evident is that any proposition about the future belongs by its subject-matter to some particular science, and is to be ascertained, if at all, by the methods of that science. Philosophy is not a short cut to the same kind of results as those of the other sciences: if it is to be a genuine study, it must have a province of its own, and aim at results which the other sciences can neither prove nor disprove.

The consideration that philosophy, if there is such a study, must consist of propositions which could not occur in the other sciences, is one which has very far-reaching consequences. All the questions which have what is called a human interest--such, for example, as the question of a future life--belong, at least in theory, to special sciences, and are capable, at least in theory, of being decided by empirical evidence. Philosophers have too often, in the past, permitted themselves to pronounce on empirical questions, and found themselves, as a result, in disastrous conflict with well-attested facts. We must, therefore, renounce the hope that philosophy can promise satisfaction to our mundane desires. What it can do, when it is purified from all practical taint, is to help us to understand the general aspects of the world and the logical analysis of familiar but complex things. Through this achievement, by the suggestion of fruitful hypotheses, it may be indirectly useful in other sciences, notably mathematics, physics, and psychology. But a genuinely scientific philosophy cannot hope to appeal to any except those who have the wish to understand, to escape from intellectual bewilderment. It offers, in its own domain, the kind of satisfaction which the other sciences offer. But it does not offer, or attempt to offer, a solution of the problem of human destiny, or of the destiny of the universe.

Evolutionism, if what has been said is true, is to be regarded as a hasty generalisation from certain rather special facts, accompanied by a dogmatic rejection of all attempts at analysis, and inspired by interests which are practical rather than theoretical. In spite, therefore, of its appeal to detailed results in various sciences, it cannot be regarded as any more genuinely scientific than the classical tradition which it has replaced. How philosophy is to be rendered scientific, and what is the true subject-matter of philosophy, I shall try to show first by examples of certain achieved results, and then more generally. We will begin with the problem of the physical conceptions of space and time and matter, which, as we have seen, are challenged by the contentions of the evolutionists. That these conceptions stand in need of reconstruction will be admitted, and is indeed increasingly urged by physicists themselves. It will also be admitted that the reconstruction must take more account of change and the universal flux than is done in the older mechanics with its fundamental conception of an indestructible matter. But I do not think the reconstruction required is on Bergsonian lines, nor do I think that his rejection of logic can be anything but harmful. I shall not, however, adopt the method of explicit controversy, but rather the method of independent inquiry, starting from what, in a pre-philosophic stage, appear to be facts, and keeping always as close to these initial data as the requirements of consistency will permit.

Although explicit controversy is almost always fruitless in philosophy, owing to the fact that no two philosophers ever understand one another, yet it seems necessary to say something at the outset in justification of the scientific as against the mystical attitude. Metaphysics, from the first, has been developed by the union or the conflict of these two attitudes. Among the earliest Greek philosophers, the Ionians were more scientific and the Sicilians more mystical.[6] But among the latter, Pythagoras, for example, was in himself a curious mixture of the two tendencies: the scientific attitude led him to his proposition on right-angled triangles, while his mystic insight showed him that it is wicked to eat beans. Naturally enough, his followers divided into two sects, the lovers

of right-angled triangles and the abhorrers of beans; but the former sect died out, leaving, however, a haunting flavour of mysticism over much Greek mathematical speculation, and in particular over Plato's views on mathematics. Plato, of course, embodies both the scientific and the mystical attitudes in a higher form than his predecessors, but the mystical attitude is distinctly the stronger of the two, and secures ultimate victory whenever the conflict is sharp. Plato, moreover, adopted from the Eleatics the device of using logic to defeat common sense, and thus to leave the field clear for mysticism--a device still employed in our own day by the adherents of the classical tradition.

[6] _Cf._ Burnet, _Early Greek Philosophy_, pp. 85 ff.

The logic used in defence of mysticism seems to me faulty as logic, and in a later lecture I shall criticise it on this ground. But the more thorough-going mystics do not employ logic, which they despise: they appeal instead directly to the immediate deliverance of their insight. Now, although fully developed mysticism is rare in the West, some tincture of it colours the thoughts of many people, particularly as regards matters on which they have strong convictions not based on evidence. In all who seek passionately for the fugitive and difficult goods, the conviction is almost irresistible that there is in the world something deeper, more significant, than the multiplicity of little facts chronicled and classified by science. Behind the veil of these mundane things, they feel, something quite different obscurely shimmers, shining forth clearly in the great moments of illumination, which alone give anything worthy to be called real knowledge of truth. To seek such moments, therefore, is to them the way of wisdom, rather than, like the man of science, to observe coolly, to analyse without emotion, and to accept without question the equal reality of the trivial and the important.

Of the reality or unreality of the mystic's world I know nothing. I have no wish to deny it, nor even to declare that the insight which reveals it is not a genuine insight. What I do wish to maintain--and it is here that the scientific attitude becomes imperative--is that insight, untested and unsupported, is an insufficient guarantee of truth, in spite of the fact that much of the most important truth is first suggested by its means. It is common to speak of an opposition between instinct and reason; in the eighteenth century, the opposition was drawn in favour of reason, but under the influence of Rousseau and the romantic movement instinct was given the preference, first by those who rebelled against artificial forms of government and thought, and then, as the purely rationalistic defence of traditional theology became increasingly difficult, by all who felt in science a menace to creeds which they associated with a spiritual outlook on life and the world. Bergson, under the name of "intuition," has raised instinct to the position of sole arbiter of metaphysical truth. But in fact the opposition of instinct and reason is mainly illusory. Instinct, intuition, or insight is what first leads to the beliefs which subsequent reason confirms or confutes; but the confirmation, where it is possible, consists, in the last analysis, of agreement with other beliefs no less instinctive. Reason is a harmonising, controlling force rather than a creative one. Even in the most purely logical realms, it is insight that first arrives at what is new.

Where instinct and reason do sometimes conflict is in regard to single beliefs, held instinctively, and held with such determination that no degree of inconsistency with other beliefs leads to their abandonment. Instinct, like all human faculties, is liable to error. Those in whom reason is weak are often unwilling to admit this as regards themselves, though all admit it in regard to others. Where instinct is least liable to error is in practical matters as to which right judgment is a help to survival; friendship and hostility in others, for instance, are often felt with extraordinary discrimination through very careful disguises. But even in such matters a wrong impression may be given by reserve or flattery; and in matters less directly practical, such as philosophy deals with, very strong instinctive beliefs may be wholly mistaken, as we may come to know through their perceived inconsistency with other equally strong beliefs. It is such considerations that necessitate the harmonising mediation of reason, which tests our beliefs by their mutual compatibility, and examines, in doubtful cases, the possible sources of error on the one side and on the other. In this there is no opposition to instinct as a whole, but only to blind reliance upon some one interesting aspect of instinct to the exclusion of other more commonplace but not less trustworthy aspects. It is such onesidedness, not instinct itself, that reason aims at correcting.

These more or less trite maxims may be illustrated by application to Bergson's advocacy of "intuition" as against "intellect." There are, he says, "two profoundly different ways of knowing a thing. The first implies that we move round the object; the second that we enter into it. The first depends on the point of view at which we are placed and on the symbols by which we express ourselves. The second neither depends on a point of view nor relies on any symbol. The first kind of knowledge may be said to stop at the _relative_; the second, in those cases where it is possible, to attain the _absolute_."[7] The second of these, which is intuition, is, he says, "the kind of intellectual _sympathy_ by which one places oneself within an object in order to coincide with what is unique in it and therefore inexpressible" (p. 6). In illustration, he mentions self-knowledge: "there is one reality, at least, which we all seize from within, by intuition and not by simple analysis. It is our own personality in its flowing through time--our self which endures" (p. 8). The rest of Bergson's philosophy consists in reporting, through the imperfect medium of words, the knowledge gained by

intuition, and the consequent complete condemnation of all the pretended knowledge derived from science and common sense.

[7] _Introduction to Metaphysics_, p. 1.

This procedure, since it takes sides in a conflict of instinctive beliefs, stands in need of justification by proving the greater trustworthiness of the beliefs on one side than of those on the other. Bergson attempts this justification in two ways--first, by explaining that intellect is a purely practical faculty designed to secure biological success; secondly, by mentioning remarkable feats of instinct in animals, and by pointing out characteristics of the world which, though intuition can apprehend them, are baffling to intellect as he interprets it.

Of Bergson's theory that intellect is a purely practical faculty developed in the struggle for survival, and not a source of true beliefs, we may say, first, that it is only through intellect that we know of the struggle for survival and of the biological ancestry of man: if the intellect is misleading, the whole of this merely inferred history is presumably untrue. If, on the other hand, we agree with M. Bergson in thinking that evolution took place as Darwin believed, then it is not only intellect, but all our faculties, that have been developed under the stress of practical utility. Intuition is seen at its best where it is directly useful--for example, in regard to other people's characters and dispositions. Bergson apparently holds that capacity for this kind of knowledge is less explicable by the struggle for existence than, for example, capacity for pure mathematics. Yet the savage deceived by false friendship is likely to pay for his mistake with his life; whereas even in the most civilised societies men are not put to death for mathematical incompetence. All the most striking of his instances of intuition in animals have a very direct survival value. The fact is, of course, that both intuition and intellect have been developed because they are useful, and that, speaking broadly, they are useful when they give truth and become harmful when they give falsehood. Intellect, in civilised man, like artistic capacity, has occasionally been developed beyond the point where it is useful to the individual; intuition, on the other hand, seems on the whole to diminish as civilisation increases. Speaking broadly, it is greater in children than in adults, in the uneducated than in the educated. Probably in dogs it exceeds anything to be found in human beings. But those who find in these facts a recommendation of intuition ought to return to running wild in the woods, dyeing themselves with woad and living on hips and haws.

Let us next examine whether intuition possesses any such infallibility as Bergson claims for it. The best instance of it, according to him, is our acquaintance with ourselves; yet self-knowledge is proverbially rare and difficult. Most men, for example, have in their nature meannesses, vanities, and envies of which they are quite unconscious, though even their best friends can perceive them without any difficulty. It is true that intuition has a convincingness which is lacking to intellect: while it is present, it is almost impossible to doubt its truth. But if it should appear, on examination, to be at least as fallible as intellect, its greater subjective certainty becomes a demerit, making it only the more irresistibly deceptive. Apart from self-knowledge, one of the most notable examples of intuition is the knowledge people believe themselves to possess of those with whom they are in love: the wall between different personalities seems to become transparent, and people think they see into another soul as into their own. Yet deception in such cases is constantly practised with success; and even where there is no intentional deception, experience gradually proves, as a rule, that the supposed insight was illusory, and that the slower, more groping methods of the intellect are in the long run more reliable.

Bergson maintains that intellect can only deal with things in so far as they resemble what has been experienced in the past, while intuition has the power of apprehending the uniqueness and novelty that always belong to each fresh moment. That there is something unique and new at every moment, is certainly true; it is also true that this cannot be fully expressed by means of intellectual concepts. Only direct acquaintance can give knowledge of what is unique and new. But direct acquaintance of this kind is given fully in sensation, and does not require, so far as I can see, any special faculty of intuition for its apprehension. It is neither intellect nor intuition, but sensation, that supplies new data; but when the data are new in any remarkable manner, intellect is much more capable of dealing with them than intuition would be. The hen with a brood of ducklings no doubt has intuitions which seem to place her inside them, and not merely to know them analytically; but when the ducklings take to the water, the whole apparent intuition is seen to be illusory, and the hen is left helpless on the shore. Intuition, in fact, is an aspect and development of instinct, and, like all instinct, is admirable in those customary surroundings which have moulded the habits of the animal in question, but totally incompetent as soon as the surroundings are changed in a way which demands some non-habitual mode of action.

The theoretical understanding of the world, which is the aim of philosophy, is not a matter of great practical importance to animals, or to savages, or even to most civilised men. It is hardly to be supposed, therefore, that the rapid, rough and ready methods of instinct or intuition will find in this field a favourable ground for their application. It is the older kinds of activity, which bring out our kinship with remote generations of animal and semi-human ancestors, that show intuition at its best. In such matters as

self-preservation and love, intuition will act sometimes (though not always) with a swiftness and precision which are astonishing to the critical intellect. But philosophy is not one of the pursuits which illustrate our affinity with the past: it is a highly refined, highly civilised pursuit, demanding, for its success, a certain liberation from the life of instinct, and even, at times, a certain aloofness from all mundane hopes and fears. It is not in philosophy, therefore, that we can hope to see intuition at its best. On the contrary, since the true objects of philosophy, and the habits of thought demanded for their apprehension, are strange, unusual, and remote, it is here, more almost than anywhere else, that intellect proves superior to intuition, and that quick unanalysed convictions are least deserving of uncritical acceptance.

Before embarking upon the somewhat difficult and abstract discussions which lie before us, it will be well to take a survey of the hopes we may retain and the hopes we must abandon. The hope of satisfaction to our more human desires--the hope of demonstrating that the world has this or that desirable ethical characteristic--is not one which, so far as I can see, philosophy can do anything whatever to satisfy. The difference between a good world and a bad one is a difference in the particular characteristics of the particular things that exist in these worlds: it is not a sufficiently abstract difference to come within the province of philosophy. Love and hate, for example, are ethical opposites, but to philosophy they are closely analogous attitudes towards objects. The general form and structure of those attitudes towards objects which constitute mental phenomena is a problem for philosophy; but the difference between love and hate is not a difference of form or structure, and therefore belongs rather to the special science of psychology than to philosophy. Thus the ethical interests which have often inspired philosophers must remain in the background: some kind of ethical interest may inspire the whole study, but none must obtrude in the detail or be expected in the special results which are sought.

If this view seems at first sight disappointing, we may remind ourselves that a similar change has been found necessary in all the other sciences. The physicist or chemist is not now required to prove the ethical importance of his ions or atoms; the biologist is not expected to prove the utility of the plants or animals which he dissects. In pre-scientific ages this was not the case. Astronomy, for example, was studied because men believed in astrology: it was thought that the movements of the planets had the most direct and important bearing upon the lives of human beings. Presumably, when this belief decayed and the disinterested study of astronomy began, many who had found astrology absorbingly interesting decided that astronomy had too little human interest to be worthy of study. Physics, as it appears in Plato's _Timaeus_ for example, is full of ethical notions: it is an essential part of its purpose to show that the earth is worthy of admiration. The modern physicist, on the contrary, though he has no wish to deny that the earth is admirable, is not concerned, as physicist, with its ethical attributes: he is merely concerned to find out facts, not to consider whether they are good or bad. In psychology, the scientific attitude is even more recent and more difficult than in the physical sciences: it is natural to consider that human nature is either good or bad, and to suppose that the difference between good and bad, so all-important in practice, must be important in theory also. It is only during the last century that an ethically neutral science of psychology has grown up; and here too ethical neutrality has been essential to scientific success.

In philosophy, hitherto, ethical neutrality has been seldom sought and hardly ever achieved. Men have remembered their wishes, and have judged philosophies in relation to their wishes. Driven from the particular sciences, the belief that the notions of good and evil must afford a key to the understanding of the world has sought a refuge in philosophy. But even from this last refuge, if philosophy is not to remain a set of pleasing dreams, this belief must be driven forth. It is a commonplace that happiness is not best achieved by those who seek it directly; and it would seem that the same is true of the good. In thought, at any rate, those who forget good and evil and seek only to know the facts are more likely to achieve good than those who view the world through the distorting medium of their own desires.

The immense extension of our knowledge of facts in recent times has had, as it had in the Renaissance, two effects upon the general intellectual outlook. On the one hand, it has made men distrustful of the truth of wide, ambitious systems: theories come and go swiftly, each serving, for a moment, to classify known facts and promote the search for new ones, but each in turn proving inadequate to deal with the new facts when they have been found. Even those who invent the theories do not, in science, regard them as anything but a temporary makeshift. The ideal of an all-embracing synthesis, such as the Middle Ages believed themselves to have attained, recedes further and further beyond the limits of what seems feasible. In such a world, as in the world of Montaigne, nothing seems worth while except the discovery of more and more facts, each in turn the deathblow to some cherished theory; the ordering intellect grows weary, and becomes slovenly through despair.

On the other hand, the new facts have brought new powers; man's physical control over natural forces has been increasing with unexampled rapidity, and promises to increase in the future beyond all easily assignable limits. Thus alongside of despair as regards ultimate theory there is an immense optimism as regards practice: what man can _do_ seems almost boundless. The old

fixed limits of human power, such as death, or the dependence of the race on an equilibrium of cosmic forces, are forgotten, and no hard facts are allowed to break in upon the dream of omnipotence. No philosophy is tolerated which sets bounds to man's capacity of gratifying his wishes; and thus the very despair of theory is invoked to silence every whisper of doubt as regards the possibilities of practical achievement.

In the welcoming of new fact, and in the suspicion of dogmatism as regards the universe at large, the modern spirit should, I think, be accepted as wholly an advance. But both in its practical pretensions and in its theoretical despair it seems to me to go too far. Most of what is greatest in man is called forth in response to the thwarting of his hopes by immutable natural obstacles; by the pretence of omnipotence, he becomes trivial and a little absurd. And on the theoretical side, ultimate metaphysical truth, though less all-embracing and harder of attainment than it appeared to some philosophers in the past, can, I believe, be discovered by those who are willing to combine the hopefulness, patience, and open-mindedness of science with something of the Greek feeling for beauty in the abstract world of logic and for the ultimate intrinsic value in the contemplation of truth.

The philosophy, therefore, which is to be genuinely inspired by the scientific spirit, must deal with somewhat dry and abstract matters, and must not hope to find an answer to the practical problems of life. To those who wish to understand much of what has in the past been most difficult and obscure in the constitution of the universe, it has great rewards to offer--triumphs as noteworthy as those of Newton and Darwin, and as important in the long run, for the moulding of our mental habits. And it brings with it--as a new and powerful method of investigation always does--a sense of power and a hope of progress more reliable and better grounded than any that rests on hasty and fallacious generalisation as to the nature of the universe at large. Many hopes which inspired philosophers in the past it cannot claim to fulfil; but other hopes, more purely intellectual, it can satisfy more fully than former ages could have deemed possible for human minds.

LECTURE II

LOGIC AS THE ESSENCE OF PHILOSOPHY

The topics we discussed in our first lecture, and the topics we shall discuss later, all reduce themselves, in so far as they are genuinely philosophical, to problems of logic. This is not due to any accident, but to the fact that every philosophical problem, when it is subjected to the necessary analysis and purification, is found either to be not really philosophical at all, or else to be, in the sense in which we are using the word, logical. But as the word "logic" is never used in the same sense by two different philosophers, some explanation of what I mean by the word is indispensable at the outset.

Logic, in the Middle Ages, and down to the present day in teaching, meant no more than a scholastic collection of technical terms and rules of syllogistic inference. Aristotle had spoken, and it was the part of humbler men merely to repeat the lesson after him. The trivial nonsense embodied in this tradition is still set in examinations, and defended by eminent authorities as an excellent "propaedeutic," _i.e._ a training in those habits of solemn humbug which are so great a help in later life. But it is not this that I mean to praise in saying that all philosophy is logic. Ever since the beginning of the seventeenth century, all vigorous minds that have concerned themselves with inference have abandoned the mediaeval tradition, and in one way or other have widened the scope of logic.

The first extension was the introduction of the inductive method by Bacon and Galileo--by the former in a theoretical and largely mistaken form, by the latter in actual use in establishing the foundations of modern physics and astronomy. This is probably the only extension of the old logic which has become familiar to the general educated public. But induction, important as it is when regarded as a method of investigation, does not seem to remain when its work is done: in the final form of a perfected science, it would seem that everything ought to be deductive. If induction remains at all, which is a difficult question, it will remain merely as one of the principles according to which deductions are effected. Thus the ultimate result of the introduction of the inductive method seems not the creation of a new kind of non-deductive reasoning, but rather the widening of the scope of deduction by pointing out a way of deducing which is certainly not syllogistic, and does not fit into the mediaeval scheme.

The question of the scope and validity of induction is of great difficulty, and of great importance to our knowledge. Take such a question as, "Will the sun rise to-morrow?" Our first instinctive feeling is that we have abundant reason for saying that it will, because it has risen on so many previous mornings. Now, I do not myself know whether this does afford a ground or not, but I am willing to suppose that it does. The question which then arises is: What is the principle of inference by which we pass from past sunrises to future ones? The answer given by Mill is that the inference depends upon the law of causation. Let us suppose this to

be true; then what is the reason for believing in the law of causation? There are broadly three possible answers: (1) that it is itself known _a priori_; (2) that it is a postulate; (3) that it is an empirical generalisation from past instances in which it has been found to hold. The theory that causation is known _a priori_ cannot be definitely refuted, but it can be rendered very unplausible by the mere process of formulating the law exactly, and thereby showing that it is immensely more complicated and less obvious than is generally supposed. The theory that causation is a postulate, _i.e._ that it is something which we choose to assert although we know that it is very likely false, is also incapable of refutation; but it is plainly also incapable of justifying any use of the law in inference. We are thus brought to the theory that the law is an empirical generalisation, which is the view held by Mill.

But if so, how are empirical generalisations to be justified? The evidence in their favour cannot be empirical, since we wish to argue from what has been observed to what has not been observed, which can only be done by means of some known relation of the observed and the unobserved; but the unobserved, by definition, is not known empirically, and therefore its relation to the observed, if known at all, must be known independently of empirical evidence. Let us see what Mill says on this subject.

According to Mill, the law of causation is proved by an admittedly fallible process called "induction by simple enumeration." This process, he says, "consists in ascribing the nature of general truths to all propositions which are true in every instance that we happen to know of."[8] As regards its fallibility, he asserts that "the precariousness of the method of simple enumeration is in an inverse ratio to the largeness of the generalisation. The process is delusive and insufficient, exactly in proportion as the subject-matter of the observation is special and limited in extent. As the sphere widens, this unscientific method becomes less and less liable to mislead; and the most universal class of truths, the law of causation for instance, and the principles of number and of geometry, are duly and satisfactorily proved by that method alone, nor are they susceptible of any other proof."[9]

[8] _Logic_, book iii., chapter iii., Sec. 2.

[9] Book iii., chapter xxi., Sec. 3.

In the above statement, there are two obvious lacunae: (1) How is the method of simple enumeration itself justified? (2) What logical principle, if any, covers the same ground as this method, without being liable to its failures? Let us take the second question first.

A method of proof which, when used as directed, gives sometimes truth and sometimes falsehood--as the method of simple enumeration does--is obviously not a valid method, for validity demands invariable truth. Thus, if simple enumeration is to be rendered valid, it must not be stated as Mill states it. We shall have to say, at most, that the data render the result _probable_. Causation holds, we shall say, in every instance we have been able to test; therefore it _probably_ holds in untested instances. There are terrible difficulties in the notion of probability, but we may ignore them at present. We thus have what at least _may_ be a logical principle, since it is without exception. If a proposition is true in every instance that we happen to know of, and if the instances are very numerous, then, we shall say, it becomes very probable, on the data, that it will be true in any further instance. This is not refuted by the fact that what we declare to be probable does not always happen, for an event may be probable on the data and yet not occur. It is, however, obviously capable of further analysis, and of more exact statement. We shall have to say something like this: that every instance of a proposition[10] being true increases the probability of its being true in a fresh instance, and that a sufficient number of favourable instances will, in the absence of instances to the contrary, make the probability of the truth of a fresh instance approach indefinitely near to certainty. Some such principle as this is required if the method of simple enumeration is to be valid.

[10] Or rather a propositional function.

But this brings us to our other question, namely, how is our principle known to be true? Obviously, since it is required to justify induction, it cannot be proved by induction; since it goes beyond the empirical data, it cannot be proved by them alone; since it is required to justify all inferences from empirical data to what goes beyond them, it cannot itself be even rendered in any degree probable by such data. Hence, _if_ it is known, it is not known by experience, but independently of experience. I do not say that any such principle is known: I only say that it is required to justify the inferences from experience which empiricists allow, and that it cannot itself be justified empirically.[11]

[11] The subject of causality and induction will be discussed again in Lecture VIII.

A similar conclusion can be proved by similar arguments concerning any other logical principle. Thus logical knowledge is not derivable from experience alone, and the empiricist's philosophy can therefore not be accepted in its entirety, in spite of its

excellence in many matters which lie outside logic.

Hegel and his followers widened the scope of logic in quite a different way--a way which I believe to be fallacious, but which requires discussion if only to show how their conception of logic differs from the conception which I wish to advocate. In their writings, logic is practically identical with metaphysics. In broad outline, the way this came about is as follows. Hegel believed that, by means of _a priori_ reasoning, it could be shown that the world _must_ have various important and interesting characteristics, since any world without these characteristics would be impossible and self-contradictory. Thus what he calls "logic" is an investigation of the nature of the universe, in so far as this can be inferred merely from the principle that the universe must be logically self-consistent. I do not myself believe that from this principle alone anything of importance can be inferred as regards the existing universe. But, however that may be, I should not regard Hegel's reasoning, even if it were valid, as properly belonging to logic: it would rather be an application of logic to the actual world. Logic itself would be concerned rather with such questions as what self-consistency is, which Hegel, so far as I know, does not discuss. And though he criticises the traditional logic, and professes to replace it by an improved logic of his own, there is some sense in which the traditional logic, with all its faults, is uncritically and unconsciously assumed throughout his reasoning. It is not in the direction advocated by him, it seems to me, that the reform of logic is to be sought, but by a more fundamental, more patient, and less ambitious investigation into the presuppositions which his system shares with those of most other philosophers.

The way in which, as it seems to me, Hegel's system assumes the ordinary logic which it subsequently criticises, is exemplified by the general conception of "categories" with which he operates throughout. This conception is, I think, essentially a product of logical confusion, but it seems in some way to stand for the conception of "qualities of Reality as a whole." Mr Bradley has worked out a theory according to which, in all judgment, we are ascribing a predicate to Reality as a whole; and this theory is derived from Hegel. Now the traditional logic holds that every proposition ascribes a predicate to a subject, and from this it easily follows that there can be only one subject, the Absolute, for if there were two, the proposition that there were two would not ascribe a predicate to either. Thus Hegel's doctrine, that philosophical propositions must be of the form, "the Absolute is such-and-such," depends upon the traditional belief in the universality of the subject-predicate form. This belief, being traditional, scarcely self-conscious, and not supposed to be important, operates underground, and is assumed in arguments which, like the refutation of relations, appear at first sight such as to establish its truth. This is the most important respect in which Hegel uncritically assumes the traditional logic. Other less important respects--though important enough to be the source of such essentially Hegelian conceptions as the "concrete universal" and the "union of identity in difference"--will be found where he explicitly deals with formal logic.[12]

[12] See the translation by H. S. Macran, _Hegel's Doctrine of Formal Logic_, Oxford, 1912. Hegel's argument in this portion of his "Logic" depends throughout upon confusing the "is" of predication, as in "Socrates is mortal," with the "is" of identity, as in "Socrates is the philosopher who drank the hemlock." Owing to this confusion, he thinks that "Socrates" and "mortal" must be identical. Seeing that they are different, he does not infer, as others would, that there is a mistake somewhere, but that they exhibit "identity in difference." Again, Socrates is particular, "mortal" is universal. Therefore, he says, since Socrates is mortal, it follows that the particular is the universal--taking the "is" to be throughout expressive of identity. But to say "the particular is the universal" is self-contradictory. Again Hegel does not suspect a mistake but proceeds to synthesise particular and universal in the individual, or concrete universal. This is an example of how, for want of care at the start, vast and imposing systems of philosophy are built upon stupid and trivial confusions, which, but for the almost incredible fact that they are unintentional, one would be tempted to characterise as puns.

There is quite another direction in which a large technical development of logic has taken place: I mean the direction of what is called logistic or mathematical logic. This kind of logic is mathematical in two different senses: it is itself a branch of mathematics, and it is the logic which is specially applicable to other more traditional branches of mathematics. Historically, it began as _merely_ a branch of mathematics: its special applicability to other branches is a more recent development. In both respects, it is the fulfilment of a hope which Leibniz cherished throughout his life, and pursued with all the ardour of his amazing intellectual energy. Much of his work on this subject has been published recently, since his discoveries have been remade by others; but none was published by him, because his results persisted in contradicting certain points in the traditional doctrine of the syllogism. We now know that on these points the traditional doctrine is wrong, but respect for Aristotle prevented Leibniz from realising that this was possible.[13]

[13] _Cf._ Couturat, _La Logique de Leibniz_, pp. 361, 386.

The modern development of mathematical logic dates from Boole's _Laws of Thought_ (1854). But in him and his successors, before Peano and Frege, the only thing really achieved, apart from certain details, was the invention of a mathematical symbolism for deducing consequences from the premisses which the newer methods shared with those of Aristotle. This subject has considerable interest as an independent branch of mathematics, but it has very little to do with real logic. The first serious advance in real logic since the time of the Greeks was made independently by Peano and Frege--both mathematicians. They both arrived at their logical results by an analysis of mathematics. Traditional logic regarded the two propositions, "Socrates is mortal" and "All men are mortal," as being of the same form;[14] Peano and Frege showed that they are utterly different in form. The philosophical importance of logic may be illustrated by the fact that this confusion--which is still committed by most writers--obscured not only the whole study of the forms of judgment and inference, but also the relations of things to their qualities, of concrete existence to abstract concepts, and of the world of sense to the world of Platonic ideas. Peano and Frege, who pointed out the error, did so for technical reasons, and applied their logic mainly to technical developments; but the philosophical importance of the advance which they made is impossible to exaggerate.

[14] It was often recognised that there was _some_ difference between them, but it was not recognised that the difference is fundamental, and of very great importance.

Mathematical logic, even in its most modern form, is not _directly_ of philosophical importance except in its beginnings. After the beginnings, it belongs rather to mathematics than to philosophy. Of its beginnings, which are the only part of it that can properly be called _philosophical_ logic, I shall speak shortly. But even the later developments, though not directly philosophical, will be found of great indirect use in philosophising. They enable us to deal easily with more abstract conceptions than merely verbal reasoning can enumerate; they suggest fruitful hypotheses which otherwise could hardly be thought of; and they enable us to see quickly what is the smallest store of materials with which a given logical or scientific edifice can be constructed. Not only Frege's theory of number, which we shall deal with in Lecture VII., but the whole theory of physical concepts which will be outlined in our next two lectures, is inspired by mathematical logic, and could never have been imagined without it.

In both these cases, and in many others, we shall appeal to a certain principle called "the principle of abstraction." This principle, which might equally well be called "the principle which dispenses with abstraction," and is one which clears away incredible accumulations of metaphysical lumber, was directly suggested by mathematical logic, and could hardly have been proved or practically used without its help. The principle will be explained in our fourth lecture, but its use may be briefly indicated in advance. When a group of objects have that kind of similarity which we are inclined to attribute to possession of a common quality, the principle in question shows that membership of the group will serve all the purposes of the supposed common quality, and that therefore, unless some common quality is actually known, the group or class of similar objects may be used to replace the common quality, which need not be assumed to exist. In this and other ways, the indirect uses of even the later parts of mathematical logic are very great; but it is now time to turn our attention to its philosophical foundations.

In every proposition and in every inference there is, besides the particular subject-matter concerned, a certain _form_, a way in which the constituents of the proposition or inference are put together. If I say, "Socrates is mortal," "Jones is angry," "The sun is hot," there is something in common in these three cases, something indicated by the word "is." What is in common is the _form_ of the proposition, not an actual constituent. If I say a number of things about Socrates--that he was an Athenian, that he married Xantippe, that he drank the hemlock--there is a common constituent, namely Socrates, in all the propositions I enunciate, but they have diverse forms. If, on the other hand, I take any one of these propositions and replace its constituents, one at a time, by other constituents, the form remains constant, but no constituent remains. Take (say) the series of propositions, "Socrates drank the hemlock," "Coleridge drank the hemlock," "Coleridge drank opium," "Coleridge ate opium." The form remains unchanged throughout this series, but all the constituents are altered. Thus form is not another constituent, but is the way the constituents are put together. It is forms, in this sense, that are the proper object of philosophical logic.

It is obvious that the knowledge of logical forms is something quite different from knowledge of existing things. The form of "Socrates drank the hemlock" is not an existing thing like Socrates or the hemlock, nor does it even have that close relation to existing things that drinking has. It is something altogether more abstract and remote. We might understand all the separate words of a sentence without understanding the sentence: if a sentence is long and complicated, this is apt to happen. In such a case we have knowledge of the constituents, but not of the form. We may also have knowledge of the form without having knowledge of the constituents. If I say, "Rorarius drank the hemlock," those among you who have never heard of Rorarius (supposing there are any) will understand the form, without having knowledge of all the constituents. In order to understand a sentence, it is necessary to have knowledge both of the constituents and of the particular instance of the form. It is in this way that a sentence conveys

information, since it tells us that certain known objects are related according to a certain known form. Thus some kind of knowledge of logical forms, though with most people it is not explicit, is involved in all understanding of discourse. It is the business of philosophical logic to extract this knowledge from its concrete integuments, and to render it explicit and pure.

In all inference, form alone is essential: the particular subject-matter is irrelevant except as securing the truth of the premisses. This is one reason for the great importance of logical form. When I say, "Socrates was a man, all men are mortal, therefore Socrates was mortal," the connection of premisses and conclusion does not in any way depend upon its being Socrates and man and mortality that I am mentioning. The general form of the inference may be expressed in some such words as, "If a thing has a certain property, and whatever has this property has a certain other property, then the thing in question also has that other property." Here no particular things or properties are mentioned: the proposition is absolutely general. All inferences, when stated fully, are instances of propositions having this kind of generality. If they seem to depend upon the subject-matter otherwise than as regards the truth of the premisses, that is because the premisses have not been all explicitly stated. In logic, it is a waste of time to deal with inferences concerning particular cases: we deal throughout with completely general and purely formal implications, leaving it to other sciences to discover when the hypotheses are verified and when they are not.

But the forms of propositions giving rise to inferences are not the simplest forms: they are always hypothetical, stating that if one proposition is true, then so is another. Before considering inference, therefore, logic must consider those simpler forms which inference presupposes. Here the traditional logic failed completely: it believed that there was only one form of simple proposition (_i.e._ of proposition not stating a relation between two or more other propositions), namely, the form which ascribes a predicate to a subject. This is the appropriate form in assigning the qualities of a given thing--we may say "this thing is round, and red, and so on." Grammar favours this form, but philosophically it is so far from universal that it is not even very common. If we say "this thing is bigger than that," we are not assigning a mere quality of "this," but a relation of "this" and "that." We might express the same fact by saying "that thing is smaller than this," where grammatically the subject is changed. Thus propositions stating that two things have a certain relation have a different form from subject-predicate propositions, and the failure to perceive this difference or to allow for it has been the source of many errors in traditional metaphysics.

The belief or unconscious conviction that all propositions are of the subject-predicate form--in other words, that every fact consists in some thing having some quality--has rendered most philosophers incapable of giving any account of the world of science and daily life. If they had been honestly anxious to give such an account, they would probably have discovered their error very quickly; but most of them were less anxious to understand the world of science and daily life, than to convict it of unreality in the interests of a super-sensible "real" world. Belief in the unreality of the world of sense arises with irresistible force in certain moods--moods which, I imagine, have some simple physiological basis, but are none the less powerfully persuasive. The conviction born of these moods is the source of most mysticism and of most metaphysics. When the emotional intensity of such a mood subsides, a man who is in the habit of reasoning will search for logical reasons in favour of the belief which he finds in himself. But since the belief already exists, he will be very hospitable to any reason that suggests itself. The paradoxes apparently proved by his logic are really the paradoxes of mysticism, and are the goal which he feels his logic must reach if it is to be in accordance with insight. It is in this way that logic has been pursued by those of the great philosophers who were mystics--notably Plato, Spinoza, and Hegel. But since they usually took for granted the supposed insight of the mystic emotion, their logical doctrines were presented with a certain dryness, and were believed by their disciples to be quite independent of the sudden illumination from which they sprang. Nevertheless their origin clung to them, and they remained--to borrow a useful word from Mr Santayana--"malicious" in regard to the world of science and common sense. It is only so that we can account for the complacency with which philosophers have accepted the inconsistency of their doctrines with all the common and scientific facts which seem best established and most worthy of belief.

The logic of mysticism shows, as is natural, the defects which are inherent in anything malicious. While the mystic mood is dominant, the need of logic is not felt; as the mood fades, the impulse to logic reasserts itself, but with a desire to retain the vanishing insight, or at least to prove that it _was_ insight, and that what seems to contradict it is illusion. The logic which thus arises is not quite disinterested or candid, and is inspired by a certain hatred of the daily world to which it is to be applied. Such an attitude naturally does not tend to the best results. Everyone knows that to read an author simply in order to refute him is not the way to understand him; and to read the book of Nature with a conviction that it is all illusion is just as unlikely to lead to understanding. If our logic is to find the common world intelligible, it must not be hostile, but must be inspired by a genuine acceptance such as is not usually to be found among metaphysicians.

Traditional logic, since it holds that all propositions have the subject-predicate form, is unable to admit the reality of relations: all relations, it maintains, must be reduced to properties of the apparently related terms. There are many ways of refuting this opinion; one of the easiest is derived from the consideration of what are called "asymmetrical" relations. In order to explain this, I will first explain two independent ways of classifying relations.

Some relations, when they hold between A and B, also hold between B and A. Such, for example, is the relation "brother or sister." If A is a brother or sister of B, then B is a brother or sister of A. Such again is any kind of similarity, say similarity of colour. Any kind of dissimilarity is also of this kind: if the colour of A is unlike the colour of B, then the colour of B is unlike the colour of A. Relations of this sort are called _symmetrical_. Thus a relation is symmetrical if, whenever it holds between A and B, it also holds between B and A.

All relations that are not symmetrical are called _non-symmetrical_. Thus "brother" is non-symmetrical, because, if A is a brother of B, it may happen that B is a _sister_ of A.

A relation is called _asymmetrical_ when, if it holds between A and B, it _never_ holds between B and A. Thus husband, father, grandfather, etc., are asymmetrical relations. So are _before_, _after_, _greater_, _above_, _to the right of_, etc. All the relations that give rise to series are of this kind.

Classification into symmetrical, asymmetrical, and merely non-symmetrical relations is the first of the two classifications we had to consider. The second is into transitive, intransitive, and merely non-transitive relations, which are defined as follows.

A relation is said to be _transitive_, if, whenever it holds between A and B and also between B and C, it holds between A and C. Thus _before_, _after_, _greater_, _above_ are transitive. All relations giving rise to series are transitive, but so are many others. The transitive relations just mentioned were asymmetrical, but many transitive relations are symmetrical--for instance, equality in any respect, exact identity of colour, being equally numerous (as applied to collections), and so on.

A relation is said to be _non-transitive_ whenever it is not transitive. Thus "brother" is non-transitive, because a brother of one's brother may be oneself. All kinds of dissimilarity are non-transitive.

A relation is said to be _intransitive_ when, if A has the relation to B, and B to C, A never has it to C. Thus "father" is intransitive. So is such a relation as "one inch taller" or "one year later."

Let us now, in the light of this classification, return to the question whether all relations can be reduced to predications.

In the case of symmetrical relations--_i.e._ relations which, if they hold between A and B, also hold between B and A--some kind of plausibility can be given to this doctrine. A symmetrical relation which is transitive, such as equality, can be regarded as expressing possession of some common property, while one which is not transitive, such as inequality, can be regarded as expressing possession of different properties. But when we come to asymmetrical relations, such as before and after, greater and less, etc., the attempt to reduce them to properties becomes obviously impossible. When, for example, two things are merely known to be unequal, without our knowing which is greater, we may say that the inequality results from their having different magnitudes, because inequality is a symmetrical relation; but to say that when one thing is _greater_ than another, and not merely unequal to it, that means that they have different magnitudes, is formally incapable of explaining the facts. For if the other thing had been greater than the one, the magnitudes would also have been different, though the fact to be explained would not have been the same. Thus mere _difference_ of magnitude is not _all_ that is involved, since, if it were, there would be no difference between one thing being greater than another, and the other being greater than the one. We shall have to say that the one magnitude is _greater_ than the other, and thus we shall have failed to get rid of the relation "greater." In short, both possession of the same property and possession of different properties are _symmetrical_ relations, and therefore cannot account for the existence of _asymmetrical_ relations.

Asymmetrical relations are involved in all series--in space and time, greater and less, whole and part, and many others of the most important characteristics of the actual world. All these aspects, therefore, the logic which reduces everything to subjects and predicates is compelled to condemn as error and mere appearance. To those whose logic is not malicious, such a wholesale condemnation appears impossible. And in fact there is no reason except prejudice, so far as I can discover, for denying the reality of relations. When once their reality is admitted, all _logical_ grounds for supposing the world of sense to be illusory disappear. If this is to be supposed, it must be frankly and simply on the ground of mystic insight unsupported by argument. It is impossible to argue against what professes to be insight, so long as it does not argue in its own favour. As logicians, therefore, we may admit the

possibility of the mystic's world, while yet, so long as we do not have his insight, we must continue to study the everyday world with which we are familiar. But when he contends that our world is impossible, then our logic is ready to repel his attack. And the first step in creating the logic which is to perform this service is the recognition of the reality of relations.

Relations which have two terms are only one kind of relations. A relation may have three terms, or four, or any number. Relations of two terms, being the simplest, have received more attention than the others, and have generally been alone considered by philosophers, both those who accepted and those who denied the reality of relations. But other relations have their importance, and are indispensable in the solution of certain problems. Jealousy, for example, is a relation between three people. Professor Royce mentions the relation "giving": when A gives B to C, that is a relation of three terms.[15] When a man says to his wife: "My dear, I wish you could induce Angelina to accept Edwin," his wish constitutes a relation between four people, himself, his wife, Angelina, and Edwin. Thus such relations are by no means recondite or rare. But in order to explain exactly how they differ from relations of two terms, we must embark upon a classification of the logical forms of facts, which is the first business of logic, and the business in which the traditional logic has been most deficient.

[15] _Encyclopaedia of the Philosophical Sciences_, vol. i. p. 97.

The existing world consists of many things with many qualities and relations. A complete description of the existing world would require not only a catalogue of the things, but also a mention of all their qualities and relations. We should have to know not only this, that, and the other thing, but also which was red, which yellow, which was earlier than which, which was between which two others, and so on. When I speak of a "fact," I do not mean one of the simple things in the world; I mean that a certain thing has a certain quality, or that certain things have a certain relation. Thus, for example, I should not call Napoleon a fact, but I should call it a fact that he was ambitious, or that he married Josephine. Now a fact, in this sense, is never simple, but always has two or more constituents. When it simply assigns a quality to a thing, it has only two constituents, the thing and the quality. When it consists of a relation between two things, it has three constituents, the things and the relation. When it consists of a relation between three things, it has four constituents, and so on. The constituents of facts, in the sense in which we are using the word "fact," are not other facts, but are things and qualities or relations. When we say that there are relations of more than two terms, we mean that there are single facts consisting of a single relation and more than two things. I do not mean that one relation of two terms may hold between A and B, and also between A and C, as, for example, a man is the son of his father and also the son of his mother. This constitutes two distinct facts: if we choose to treat it as one fact, it is a fact which has facts for its constituents. But the facts I am speaking of have no facts among their constituents, but only things and relations. For example, when A is jealous of B on account of C, there is only one fact, involving three people; there are not two instances of jealousy, but only one. It is in such cases that I speak of a relation of three terms, where the simplest possible fact in which the relation occurs is one involving three things in addition to the relation. And the same applies to relations of four terms or five or any other number. All such relations must be admitted in our inventory of the logical forms of facts: two facts involving the same number of things have the same form, and two which involve different numbers of things have different forms.

Given any fact, there is an assertion which expresses the fact. The fact itself is objective, and independent of our thought or opinion about it; but the assertion is something which involves thought, and may be either true or false. An assertion may be positive or negative: we may assert that Charles I. was executed, or that he did _not_ die in his bed. A negative assertion may be said to be a _denial_. Given a form of words which must be either true or false, such as "Charles I. died in his bed," we may either assert or deny this form of words: in the one case we have a positive assertion, in the other a negative one. A form of words which must be either true or false I shall call a _proposition_. Thus a proposition is the same as what may be significantly asserted or denied. A proposition which expresses what we have called a fact, _i.e._ which, when asserted, asserts that a certain thing has a certain quality, or that certain things have a certain relation, will be called an atomic proposition, because, as we shall see immediately, there are other propositions into which atomic propositions enter in a way analogous to that in which atoms enter into molecules. Atomic propositions, although, like facts, they may have any one of an infinite number of forms, are only one kind of propositions. All other kinds are more complicated. In order to preserve the parallelism in language as regards facts and propositions, we shall give the name "atomic facts" to the facts we have hitherto been considering. Thus atomic facts are what determine whether atomic propositions are to be asserted or denied.

Whether an atomic proposition, such as "this is red," or "this is before that," is to be asserted or denied can only be known empirically. Perhaps one atomic fact may sometimes be capable of being inferred from another, though this seems very doubtful; but in any case it cannot be inferred from premisses no one of which is an atomic fact. It follows that, if atomic facts are to be known at all, some at least must be known without inference. The atomic facts which we come to know in this way are the facts of

sense-perception; at any rate, the facts of sense-perception are those which we most obviously and certainly come to know in this way. If we knew all atomic facts, and also knew that there were none except those we knew, we should, theoretically, be able to infer all truths of whatever form.[16] Thus logic would then supply us with the whole of the apparatus required. But in the first acquisition of knowledge concerning atomic facts, logic is useless. In pure logic, no atomic fact is ever mentioned: we confine ourselves wholly to forms, without asking ourselves what objects can fill the forms. Thus pure logic is independent of atomic facts; but conversely, they are, in a sense, independent of logic. Pure logic and atomic facts are the two poles, the wholly _a priori_ and the wholly empirical. But between the two lies a vast intermediate region, which we must now briefly explore.

[16] This perhaps requires modification in order to include such facts as beliefs and wishes, since such facts apparently contain propositions as components. Such facts, though not strictly atomic, must be supposed included if the statement in the text is to be true.

"Molecular" propositions are such as contain conjunctions--_if_, _or_, _and_, _unless_, etc.--and such words are the marks of a molecular proposition. Consider such an assertion as, "If it rains, I shall bring my umbrella." This assertion is just as capable of truth or falsehood as the assertion of an atomic proposition, but it is obvious that either the corresponding fact, or the nature of the correspondence with fact, must be quite different from what it is in the case of an atomic proposition. Whether it rains, and whether I bring my umbrella, are each severally matters of atomic fact, ascertainable by observation. But the connection of the two involved in saying that _if_ the one happens, _then_ the other will happen, is something radically different from either of the two separately. It does not require for its truth that it should actually rain, or that I should actually bring my umbrella; even if the weather is cloudless, it may still be true that I should have brought my umbrella if the weather had been different. Thus we have here a connection of two propositions, which does not depend upon whether they are to be asserted or denied, but only upon the second being inferable from the first. Such propositions, therefore, have a form which is different from that of any atomic proposition.

Such propositions are important to logic, because all inference depends upon them. If I have told you that if it rains I shall bring my umbrella, and if you see that there is a steady downpour, you can infer that I shall bring my umbrella. There can be no inference except where propositions are connected in some such way, so that from the truth or falsehood of the one something follows as to the truth or falsehood of the other. It seems to be the case that we can sometimes know molecular propositions, as in the above instance of the umbrella, when we do not know whether the component atomic propositions are true or false. The _practical_ utility of inference rests upon this fact.

The next kind of propositions we have to consider are _general_ propositions, such as "all men are mortal," "all equilateral triangles are equiangular." And with these belong propositions in which the word "some" occurs, such as "some men are philosophers" or "some philosophers are not wise." These are the denials of general propositions, namely (in the above instances), of "all men are non-philosophers" and "all philosophers are wise." We will call propositions containing the word "some" _negative_ general propositions, and those containing the word "all" _positive_ general propositions. These propositions, it will be seen, begin to have the appearance of the propositions in logical text-books. But their peculiarity and complexity are not known to the text-books, and the problems which they raise are only discussed in the most superficial manner.

When we were discussing atomic facts, we saw that we should be able, theoretically, to infer all other truths by logic if we knew all atomic facts and also knew that there were no other atomic facts besides those we knew. The knowledge that there are no other atomic facts is positive general knowledge; it is the knowledge that "all atomic facts are known to me," or at least "all atomic facts are in this collection"--however the collection may be given. It is easy to see that general propositions, such as "all men are mortal," cannot be known by inference from atomic facts alone. If we could know each individual man, and know that he was mortal, that would not enable us to know that all men are mortal, unless we _knew_ that those were all the men there are, which is a general proposition. If we knew every other existing thing throughout the universe, and knew that each separate thing was not an immortal man, that would not give us our result unless we _knew_ that we had explored the whole universe, _i.e._ unless we knew "all things belong to this collection of things I have examined." Thus general truths cannot be inferred from particular truths alone, but must, if they are to be known, be either self-evident, or inferred from premisses of which at least one is a general truth. But all _empirical_ evidence is of _particular_ truths. Hence, if there is any knowledge of general truths at all, there must be _some_ knowledge of general truths which is independent of empirical evidence, _i.e._ does not depend upon the data of sense.

The above conclusion, of which we had an instance in the case of the inductive principle, is important, since it affords a refutation of the older empiricists. They believed that all our knowledge is derived from the senses and dependent upon them. We see that, if this view is to be maintained, we must refuse to admit that we know any general propositions. It is perfectly possible logically that

this should be the case, but it does not appear to be so in fact, and indeed no one would dream of maintaining such a view except a theorist at the last extremity. We must therefore admit that there is general knowledge not derived from sense, and that some of this knowledge is not obtained by inference but is primitive.

Such general knowledge is to be found in logic. Whether there is any such knowledge not derived from logic, I do not know; but in logic, at any rate, we have such knowledge. It will be remembered that we excluded from pure logic such propositions as, "Socrates is a man, all men are mortal, therefore Socrates is mortal," because Socrates and _man_ and _mortal_ are empirical terms, only to be understood through particular experience. The corresponding proposition in pure logic is: "If anything has a certain property, and whatever has this property has a certain other property, then the thing in question has the other property." This proposition is absolutely general: it applies to all things and all properties. And it is quite self-evident. Thus in such propositions of pure logic we have the self-evident general propositions of which we were in search.

A proposition such as, "If Socrates is a man, and all men are mortal, then Socrates is mortal," is true in virtue of its _form_ alone. Its truth, in this hypothetical form, does not depend upon whether Socrates actually is a man, nor upon whether in fact all men are mortal; thus it is equally true when we substitute other terms for Socrates and _man_ and _mortal_. The general truth of which it is an instance is purely formal, and belongs to logic. Since it does not mention any particular thing, or even any particular quality or relation, it is wholly independent of the accidental facts of the existent world, and can be known, theoretically, without any experience of particular things or their qualities and relations.

Logic, we may say, consists of two parts. The first part investigates what propositions are and what forms they may have; this part enumerates the different kinds of atomic propositions, of molecular propositions, of general propositions, and so on. The second part consists of certain supremely general propositions, which assert the truth of all propositions of certain forms. This second part merges into pure mathematics, whose propositions all turn out, on analysis, to be such general formal truths. The first part, which merely enumerates forms, is the more difficult, and philosophically the more important; and it is the recent progress in this first part, more than anything else, that has rendered a truly scientific discussion of many philosophical problems possible.

The problem of the nature of judgment or belief may be taken as an example of a problem whose solution depends upon an adequate inventory of logical forms. We have already seen how the supposed universality of the subject-predicate form made it impossible to give a right analysis of serial order, and therefore made space and time unintelligible. But in this case it was only necessary to admit relations of two terms. The case of judgment demands the admission of more complicated forms. If all judgments were true, we might suppose that a judgment consisted in apprehension of a _fact_, and that the apprehension was a relation of a mind to the fact. From poverty in the logical inventory, this view has often been held. But it leads to absolutely insoluble difficulties in the case of error. Suppose I believe that Charles I. died in his bed. There is no objective fact "Charles I.'s death in his bed" to which I can have a relation of apprehension. Charles I. and death and his bed are objective, but they are not, except in my thought, put together as my false belief supposes. It is therefore necessary, in analysing a belief, to look for some other logical form than a two-term relation. Failure to realise this necessity has, in my opinion, vitiated almost everything that has hitherto been written on the theory of knowledge, making the problem of error insoluble and the difference between belief and perception inexplicable.

Modern logic, as I hope is now evident, has the effect of enlarging our abstract imagination, and providing an infinite number of possible hypotheses to be applied in the analysis of any complex fact. In this respect it is the exact opposite of the logic practised by the classical tradition. In that logic, hypotheses which seem _prima facie_ possible are professedly proved impossible, and it is decreed in advance that reality must have a certain special character. In modern logic, on the contrary, while the _prima facie_ hypotheses as a rule remain admissible, others, which only logic would have suggested, are added to our stock, and are very often found to be indispensable if a right analysis of the facts is to be obtained. The old logic put thought in fetters, while the new logic gives it wings. It has, in my opinion, introduced the same kind of advance into philosophy as Galileo introduced into physics, making it possible at last to see what kinds of problems may be capable of solution, and what kinds must be abandoned as beyond human powers. And where a solution appears possible, the new logic provides a method which enables us to obtain results that do not merely embody personal idiosyncrasies, but must command the assent of all who are competent to form an opinion.

LECTURE III

ON OUR KNOWLEDGE OF THE EXTERNAL WORLD

Philosophy may be approached by many roads, but one of the oldest and most travelled is the road which leads through doubt as to the reality of the world of sense. In Indian mysticism, in Greek and modern monistic philosophy from Parmenides onward, in Berkeley, in modern physics, we find sensible appearance criticised and condemned for a bewildering variety of motives. The mystic condemns it on the ground of immediate knowledge of a more real and significant world behind the veil; Parmenides and Plato condemn it because its continual flux is thought inconsistent with the unchanging nature of the abstract entities revealed by logical analysis; Berkeley brings several weapons, but his chief is the subjectivity of sense-data, their dependence upon the organisation and point of view of the spectator; while modern physics, on the basis of sensible evidence itself, maintains a mad dance of electrons which has, superficially at least, very little resemblance to the immediate objects of sight or touch.

Every one of these lines of attack raises vital and interesting problems.

The mystic, so long as he merely reports a positive revelation, cannot be refuted; but when he _denies_ reality to objects of sense, he may be questioned as to what he means by "reality," and may be asked how their unreality follows from the supposed reality of his super-sensible world. In answering these questions, he is led to a logic which merges into that of Parmenides and Plato and the idealist tradition.

The logic of the idealist tradition has gradually grown very complex and very abstruse, as may be seen from the Bradleian sample considered in our first lecture. If we attempted to deal fully with this logic, we should not have time to reach any other aspect of our subject; we will therefore, while acknowledging that it deserves a long discussion, pass by its central doctrines with only such occasional criticism as may serve to exemplify other topics, and concentrate our attention on such matters as its objections to the continuity of motion and the infinity of space and time--objections which have been fully answered by modern mathematicians in a manner constituting an abiding triumph for the method of logical analysis in philosophy. These objections and the modern answers to them will occupy our fifth, sixth, and seventh lectures.

Berkeley's attack, as reinforced by the physiology of the sense-organs and nerves and brain, is very powerful. I think it must be admitted as probable that the immediate objects of sense depend for their existence upon physiological conditions in ourselves, and that, for example, the coloured surfaces which we see cease to exist when we shut our eyes. But it would be a mistake to infer that they are dependent upon mind, not real while we see them, or not the sole basis for our knowledge of the external world. This line of argument will be developed in the present lecture.

The discrepancy between the world of physics and the world of sense, which we shall consider in our fourth lecture, will be found to be more apparent than real, and it will be shown that whatever there is reason to believe in physics can probably be interpreted in terms of sense.

The instrument of discovery throughout is modern logic, a very different science from the logic of the text-books and also from the logic of idealism. Our second lecture has given a short account of modern logic and of its points of divergence from the various traditional kinds of logic.

In our last lecture, after a discussion of causality and free will, we shall try to reach a general account of the logical-analytic method of scientific philosophy, and a tentative estimate of the hopes of philosophical progress which it allows us to entertain.

In this lecture, I wish to apply the logical-analytic method to one of the oldest problems of philosophy, namely, the problem of our knowledge of the external world. What I have to say on this problem does not amount to an answer of a definite and dogmatic kind; it amounts only to an analysis and statement of the questions involved, with an indication of the directions in which evidence may be sought. But although not yet a definite solution, what can be said at present seems to me to throw a completely new light on the problem, and to be indispensable, not only in seeking the answer, but also in the preliminary question as to what parts of our problem may possibly have an ascertainable answer.

In every philosophical problem, our investigation starts from what may be called "data," by which I mean matters of common knowledge, vague, complex, inexact, as common knowledge always is, but yet somehow commanding our assent as on the whole and in some interpretation pretty certainly true. In the case of our present problem, the common knowledge involved is of various kinds. There is first our acquaintance with particular objects of daily life--furniture, houses, towns, other people, and so on. Then there is the extension of such particular knowledge to particular things outside our personal experience, through history and geography, newspapers, etc. And lastly, there is the systematisation of all this knowledge of particulars by means of physical science, which derives immense persuasive force from its astonishing power of foretelling the future. We are quite willing to admit

that there may be errors of detail in this knowledge, but we believe them to be discoverable and corrigible by the methods which have given rise to our beliefs, and we do not, as practical men, entertain for a moment the hypothesis that the whole edifice may be built on insecure foundations. In the main, therefore, and without absolute dogmatism as to this or that special portion, we may accept this mass of common knowledge as affording data for our philosophical analysis.

It may be said--and this is an objection which must be met at the outset--that it is the duty of the philosopher to call in question the admittedly fallible beliefs of daily life, and to replace them by something more solid and irrefragable. In a sense this is true, and in a sense it is effected in the course of analysis. But in another sense, and a very important one, it is quite impossible. While admitting that doubt is possible with regard to all our common knowledge, we must nevertheless accept that knowledge in the main if philosophy is to be possible at all. There is not any superfine brand of knowledge, obtainable by the philosopher, which can give us a standpoint from which to criticise the whole of the knowledge of daily life. The most that can be done is to examine and purify our common knowledge by an internal scrutiny, assuming the canons by which it has been obtained, and applying them with more care and with more precision. Philosophy cannot boast of having achieved such a degree of certainty that it can have authority to condemn the facts of experience and the laws of science. The philosophic scrutiny, therefore, though sceptical in regard to every detail, is not sceptical as regards the whole. That is to say, its criticism of details will only be based upon their relation to other details, not upon some external criterion which can be applied to all the details equally. The reason for this abstention from a universal criticism is not any dogmatic confidence, but its exact opposite; it is not that common knowledge _must_ be true, but that we possess no radically different kind of knowledge derived from some other source. Universal scepticism, though logically irrefutable, is practically barren; it can only, therefore, give a certain flavour of hesitancy to our beliefs, and cannot be used to substitute other beliefs for them.

Although data can only be criticised by other data, not by an outside standard, yet we may distinguish different grades of certainty in the different kinds of common knowledge which we enumerated just now. What does not go beyond our own personal sensible acquaintance must be for us the most certain: the "evidence of the senses" is proverbially the least open to question. What depends on testimony, like the facts of history and geography which are learnt from books, has varying degrees of certainty according to the nature and extent of the testimony. Doubts as to the existence of Napoleon can only be maintained for a joke, whereas the historicity of Agamemnon is a legitimate subject of debate. In science, again, we find all grades of certainty short of the highest. The law of gravitation, at least as an approximate truth, has acquired by this time the same kind of certainty as the existence of Napoleon, whereas the latest speculations concerning the constitution of matter would be universally acknowledged to have as yet only a rather slight probability in their favour. These varying degrees of certainty attaching to different data may be regarded as themselves forming part of our data; they, along with the other data, lie within the vague, complex, inexact body of knowledge which it is the business of the philosopher to analyse.

The first thing that appears when we begin to analyse our common knowledge is that some of it is derivative, while some is primitive; that is to say, there is some that we only believe because of something else from which it has been inferred in some sense, though not necessarily in a strict logical sense, while other parts are believed on their own account, without the support of any outside evidence. It is obvious that the senses give knowledge of the latter kind: the immediate facts perceived by sight or touch or hearing do not need to be proved by argument, but are completely self-evident. Psychologists, however, have made us aware that what is actually given in sense is much less than most people would naturally suppose, and that much of what at first sight seems to be given is really inferred. This applies especially in regard to our space-perceptions. For instance, we instinctively infer the "real" size and shape of a visible object from its apparent size and shape, according to its distance and our point of view. When we hear a person speaking, our actual sensations usually miss a great deal of what he says, and we supply its place by unconscious inference; in a foreign language, where this process is more difficult, we find ourselves apparently grown deaf, requiring, for example, to be much nearer the stage at a theatre than would be necessary in our own country. Thus the first step in the analysis of data, namely, the discovery of what is really given in sense, is full of difficulty. We will, however, not linger on this point; so long as its existence is realised, the exact outcome does not make any very great difference in our main problem.

The next step in our analysis must be the consideration of how the derivative parts of our common knowledge arise. Here we become involved in a somewhat puzzling entanglement of logic and psychology. Psychologically, a belief may be called derivative whenever it is caused by one or more other beliefs, or by some fact of sense which is not simply what the belief asserts. Derivative beliefs in this sense constantly arise without any process of logical inference, merely by association of ideas or some equally extra-logical process. From the expression of a man's face we judge as to what he is feeling: we say we _see_ that he is angry, when in fact we only see a frown. We do not judge as to his state of mind by any logical process: the judgment grows up, often

without our being able to say what physical mark of emotion we actually saw. In such a case, the knowledge is derivative psychologically; but logically it is in a sense primitive, since it is not the result of any logical deduction. There may or may not be a possible deduction leading to the same result, but whether there is or not, we certainly do not employ it. If we call a belief "logically primitive" when it is not actually arrived at by a logical inference, then innumerable beliefs are logically primitive which psychologically are derivative. The separation of these two kinds of primitiveness is vitally important to our present discussion.

When we reflect upon the beliefs which are logically but not psychologically primitive, we find that, unless they can on reflection be deduced by a logical process from beliefs which are also psychologically primitive, our confidence in their truth tends to diminish the more we think about them. We naturally believe, for example, that tables and chairs, trees and mountains, are still there when we turn our backs upon them. I do not wish for a moment to maintain that this is certainly not the case, but I do maintain that the question whether it is the case is not to be settled off-hand on any supposed ground of obviousness. The belief that they persist is, in all men except a few philosophers, logically primitive, but it is not psychologically primitive; psychologically, it arises only through our having seen those tables and chairs, trees and mountains. As soon as the question is seriously raised whether, because we have seen them, we have a right to suppose that they are there still, we feel that some kind of argument must be produced, and that if none is forthcoming, our belief can be no more than a pious opinion. We do not feel this as regards the immediate objects of sense: there they are, and as far as their momentary existence is concerned, no further argument is required. There is accordingly more need of justifying our psychologically derivative beliefs than of justifying those that are primitive.

We are thus led to a somewhat vague distinction between what we may call "hard" data and "soft" data. This distinction is a matter of degree, and must not be pressed; but if not taken too seriously it may help to make the situation clear. I mean by "hard" data those which resist the solvent influence of critical reflection, and by "soft" data those which, under the operation of this process, become to our minds more or less doubtful. The hardest of hard data are of two sorts: the particular facts of sense, and the general truths of logic. The more we reflect upon these, the more we realise exactly what they are, and exactly what a doubt concerning them really means, the more luminously certain do they become. _Verbal_ doubt concerning even these is possible, but verbal doubt may occur when what is nominally being doubted is not really in our thoughts, and only words are actually present to our minds. Real doubt, in these two cases, would, I think, be pathological. At any rate, to me they seem quite certain, and I shall assume that you agree with me in this. Without this assumption, we are in danger of falling into that universal scepticism which, as we saw, is as barren as it is irrefutable. If we are to continue philosophising, we must make our bow to the sceptical hypothesis, and, while admitting the elegant terseness of its philosophy, proceed to the consideration of other hypotheses which, though perhaps not certain, have at least as good a right to our respect as the hypothesis of the sceptic.

Applying our distinction of "hard" and "soft" data to psychologically derivative but logically primitive beliefs, we shall find that most, if not all, are to be classed as soft data. They may be found, on reflection, to be capable of logical proof, and they then again become believed, but no longer as data. As data, though entitled to a certain limited respect, they cannot be placed on a level with the facts of sense or the laws of logic. The kind of respect which they deserve seems to me such as to warrant us in hoping, though not too confidently, that the hard data may prove them to be at least probable. Also, if the hard data are found to throw no light whatever upon their truth or falsehood, we are justified, I think, in giving rather more weight to the hypothesis of their truth than to the hypothesis of their falsehood. For the present, however, let us confine ourselves to the hard data, with a view to discovering what sort of world can be constructed by their means alone.

Our data now are primarily the facts of sense (_i.e._ of _our own_ sense-data) and the laws of logic. But even the severest scrutiny will allow some additions to this slender stock. Some facts of memory--especially of recent memory--seem to have the highest degree of certainty. Some introspective facts are as certain as any facts of sense. And facts of sense themselves must, for our present purposes, be interpreted with a certain latitude. Spatial and temporal relations must sometimes be included, for example in the case of a swift motion falling wholly within the specious present. And some facts of comparison, such as the likeness or unlikeness of two shades of colour, are certainly to be included among hard data. Also we must remember that the distinction of hard and soft data is psychological and subjective, so that, if there are other minds than our own--which at our present stage must be held doubtful--the catalogue of hard data may be different for them from what it is for us.

Certain common beliefs are undoubtedly excluded from hard data. Such is the belief which led us to introduce the distinction, namely, that sensible objects in general persist when we are not perceiving them. Such also is the belief in other people's minds: this belief is obviously derivative from our perception of their bodies, and is felt to demand logical justification as soon as we become aware of its derivativeness. Belief in what is reported by the testimony of others, including all that we learn from books, is of course involved in the doubt as to whether other people have minds at all. Thus the world from which our reconstruction is to

begin is very fragmentary. The best we can say for it is that it is slightly more extensive than the world at which Descartes arrived by a similar process, since that world contained nothing except himself and his thoughts.

We are now in a position to understand and state the problem of our knowledge of the external world, and to remove various misunderstandings which have obscured the meaning of the problem. The problem really is: Can the existence of anything other than our own hard data be inferred from the existence of those data? But before considering this problem, let us briefly consider what the problem is _not_.

When we speak of the "external" world in this discussion, we must not mean "spatially external," unless "space" is interpreted in a peculiar and recondite manner. The immediate objects of sight, the coloured surfaces which make up the visible world, are spatially external in the natural meaning of this phrase. We feel them to be "there" as opposed to "here"; without making any assumption of an existence other than hard data, we can more or less estimate the distance of a coloured surface. It seems probable that distances, provided they are not too great, are actually given more or less roughly in sight; but whether this is the case or not, ordinary distances can certainly be estimated approximately by means of the data of sense alone. The immediately given world is spatial, and is further not wholly contained within our own bodies. Thus our knowledge of what is external in this sense is not open to doubt.

Another form in which the question is often put is: "Can we know of the existence of any reality which is independent of ourselves?" This form of the question suffers from the ambiguity of the two words "independent" and "self." To take the Self first: the question as to what is to be reckoned part of the Self and what is not, is a very difficult one. Among many other things which we may mean by the Self, two may be selected as specially important, namely, (1) the bare subject which thinks and is aware of objects, (2) the whole assemblage of things that would necessarily cease to exist if our lives came to an end. The bare subject, if it exists at all, is an inference, and is not part of the data; therefore this meaning of Self may be ignored in our present inquiry. The second meaning is difficult to make precise, since we hardly know what things depend upon our lives for their existence. And in this form, the definition of Self introduces the word "depend," which raises the same questions as are raised by the word "independent." Let us therefore take up the word "independent," and return to the Self later.

When we say that one thing is "independent" of another, we may mean either that it is logically possible for the one to exist without the other, or that there is no causal relation between the two such that the one only occurs as the effect of the other. The only way, so far as I know, in which one thing can be _logically_ dependent upon another is when the other is _part_ of the one. The existence of a book, for example, is logically dependent upon that of its pages: without the pages there would be no book. Thus in this sense the question, "Can we know of the existence of any reality which is independent of ourselves?" reduces to the question, "Can we know of the existence of any reality of which our Self is not part?" In this form, the question brings us back to the problem of defining the Self; but I think, however the Self may be defined, even when it is taken as the bare subject, it cannot be supposed to be part of the immediate object of sense; thus in this form of the question we must admit that we can know of the existence of realities independent of ourselves.

The question of causal dependence is much more difficult. To know that one kind of thing is causally independent of another, we must know that it actually occurs without the other. Now it is fairly obvious that, whatever legitimate meaning we give to the Self, our thoughts and feelings are causally dependent upon ourselves, _i.e._ do not occur when there is no Self for them to belong to. But in the case of objects of sense this is not obvious; indeed, as we saw, the common-sense view is that such objects persist in the absence of any percipient. If this is the case, then they are causally independent of ourselves; if not, not. Thus in this form the question reduces to the question whether we can know that objects of sense, or any other objects not our own thoughts and feelings, exist at times when we are not perceiving them. This form, in which the difficult word "independent" no longer occurs, is the form in which we stated the problem a minute ago.

Our question in the above form raises two distinct problems, which it is important to keep separate. First, can we know that objects of sense, or very similar objects, exist at times when we are not perceiving them? Secondly, if this cannot be known, can we know that other objects, inferable from objects of sense but not necessarily resembling them, exist either when we are perceiving the objects of sense or at any other time? This latter problem arises in philosophy as the problem of the "thing in itself," and in science as the problem of matter as assumed in physics. We will consider this latter problem first.

Owing to the fact that we feel passive in sensation, we naturally suppose that our sensations have outside causes. Now it is necessary here first of all to distinguish between (1) our sensation, which is a mental event consisting in our being aware of a

sensible object, and (2) the sensible object of which we are aware in sensation. When I speak of the sensible object, it must be understood that I do not mean such a thing as a table, which is both visible and tangible, can be seen by many people at once, and is more or less permanent. What I mean is just that patch of colour which is momentarily seen when we look at the table, or just that particular hardness which is felt when we press it, or just that particular sound which is heard when we rap it. Each of these I call a sensible object, and our awareness of it I call a sensation. Now our sense of passivity, if it really afforded any argument, would only tend to show that the _sensation_ has an outside cause; this cause we should naturally seek in the sensible object. Thus there is no good reason, so far, for supposing that sensible objects must have outside causes. But both the thing-in-itself of philosophy and the matter of physics present themselves as outside causes of the sensible object as much as of the sensation. What are the grounds for this common opinion?

In each case, I think, the opinion has resulted from the combination of a belief that _something_ which can persist independently of our consciousness makes itself known in sensation, with the fact that our sensations often change in ways which seem to depend upon us rather than upon anything which would be supposed to persist independently of us. At first, we believe unreflectingly that everything is as it seems to be, and that, if we shut our eyes, the objects we had been seeing remain as they were though we no longer see them. But there are arguments against this view, which have generally been thought conclusive. It is extraordinarily difficult to see just what the arguments prove; but if we are to make any progress with the problem of the external world, we must try to make up our minds as to these arguments.

A table viewed from one place presents a different appearance from that which it presents from another place. This is the language of common sense, but this language already assumes that there is a real table of which we see the appearances. Let us try to state what is known in terms of sensible objects alone, without any element of hypothesis. We find that as we walk round the table, we perceive a series of gradually changing visible objects. But in speaking of "walking round the table," we have still retained the hypothesis that there is a single table connected with all the appearances. What we ought to say is that, while we have those muscular and other sensations which make us say we are walking, our visual sensations change in a continuous way, so that, for example, a striking patch of colour is not suddenly replaced by something wholly different, but is replaced by an insensible gradation of slightly different colours with slightly different shapes. This is what we really know by experience, when we have freed our minds from the assumption of permanent "things" with changing appearances. What is really known is a correlation of muscular and other bodily sensations with changes in visual sensations.

But walking round the table is not the only way of altering its appearance. We can shut one eye, or put on blue spectacles, or look through a microscope. All these operations, in various ways, alter the visual appearance which we call that of the table. More distant objects will also alter their appearance if (as we say) the state of the atmosphere changes--if there is fog or rain or sunshine. Physiological changes also alter the appearances of things. If we assume the world of common sense, all these changes, including those attributed to physiological causes, are changes in the intervening medium. It is not quite so easy as in the former case to reduce this set of facts to a form in which nothing is assumed beyond sensible objects. Anything intervening between ourselves and what we see must be invisible: our view in every direction is bounded by the nearest visible object. It might be objected that a dirty pane of glass, for example, is visible although we can see things through it. But in this case we really see a spotted patchwork: the dirtier specks in the glass are visible, while the cleaner parts are invisible and allow us to see what is beyond. Thus the discovery that the intervening medium affects the appearances of things cannot be made by means of the sense of sight alone.

Let us take the case of the blue spectacles, which is the simplest, but may serve as a type for the others. The frame of the spectacles is of course visible, but the blue glass, if it is clean, is not visible. The blueness, which we say is in the glass, appears as being in the objects seen through the glass. The glass itself is known by means of the sense of touch. In order to know that it is between us and the objects seen through it, we must know how to correlate the space of touch with the space of sight. This correlation itself, when stated in terms of the data of sense alone, is by no means a simple matter. But it presents no difficulties of principle, and may therefore be supposed accomplished. When it has been accomplished, it becomes possible to attach a meaning to the statement that the blue glass, which we can touch, is between us and the object seen, as we say, "through" it.

But we have still not reduced our statement completely to what is actually given in sense. We have fallen into the assumption that the object of which we are conscious when we touch the blue spectacles still exists after we have ceased to touch them. So long as we are touching them, nothing except our finger can be seen through the part touched, which is the only part where we immediately know that there is something. If we are to account for the blue appearance of objects other than the spectacles, when seen through them, it might seem as if we must assume that the spectacles still exist when we are not touching them; and if this assumption really is necessary, our main problem is answered: we have means of knowing of the present existence of objects not given in

sense, though of the same kind as objects formerly given in sense.

It may be questioned, however, whether this assumption is actually unavoidable, though it is unquestionably the most natural one to make. We may say that the object of which we become aware when we touch the spectacles continues to have effects afterwards, though perhaps it no longer exists. In this view, the supposed continued existence of sensible objects after they have ceased to be sensible will be a fallacious inference from the fact that they still have effects. It is often supposed that nothing which has ceased to exist can continue to have effects, but this is a mere prejudice, due to a wrong conception of causality. We cannot, therefore, dismiss our present hypothesis on the ground of _a priori_ impossibility, but must examine further whether it can really account for the facts.

It may be said that our hypothesis is useless in the case when the blue glass is never touched at all. How, in that case, are we to account for the blue appearance of objects? And more generally, what are we to make of the hypothetical sensations of touch which we associate with untouched visible objects, which we know would be verified if we chose, though in fact we do not verify them? Must not these be attributed to permanent possession, by the objects, of the properties which touch would reveal?

Let us consider the more general question first. Experience has taught us that where we see certain kinds of coloured surfaces we can, by touch, obtain certain expected sensations of hardness or softness, tactile shape, and so on. This leads us to believe that what is seen is usually tangible, and that it has, whether we touch it or not, the hardness or softness which we should expect to feel if we touched it. But the mere fact that we are able to infer what our tactile sensations would be shows that it is not logically necessary to assume tactile qualities before they are felt. All that is really known is that the visual appearance in question, together with touch, will lead to certain sensations, which can necessarily be determined in terms of the visual appearance, since otherwise they could not be inferred from it.

We can now give a statement of the experienced facts concerning the blue spectacles, which will supply an interpretation of common-sense beliefs without assuming anything beyond the existence of sensible objects at the times when they are sensible. By experience of the correlation of touch and sight sensations, we become able to associate a certain place in touch-space with a certain corresponding place in sight-space. Sometimes, namely in the case of transparent things, we find that there is a tangible object in a touch-place without there being any visible object in the corresponding sight-place. But in such a case as that of the blue spectacles, we find that whatever object is visible beyond the empty sight-place in the same line of sight has a different colour from what it has when there is no tangible object in the intervening touch-place; and as we move the tangible object in touch-space, the blue patch moves in sight-space. If now we find a blue patch moving in this way in sight-space, when we have no sensible experience of an intervening tangible object, we nevertheless infer that, if we put our hand at a certain place in touch-space, we should experience a certain touch-sensation. If we are to avoid non-sensible objects, this must be taken as the whole of our meaning when we say that the blue spectacles are in a certain place, though we have not touched them, and have only seen other things rendered blue by their interposition.

I think it may be laid down quite generally that, _in so far_ as physics or common sense is verifiable, it must be capable of interpretation in terms of actual sense-data alone. The reason for this is simple. Verification consists always in the occurrence of an expected sense-datum. Astronomers tell us there will be an eclipse of the moon: we look at the moon, and find the earth's shadow biting into it, that is to say, we see an appearance quite different from that of the usual full moon. Now if an expected sense-datum constitutes a verification, what was asserted must have been about sense-data; or, at any rate, if part of what was asserted was not about sense-data, then only the other part has been verified. There is in fact a certain regularity or conformity to law about the occurrence of sense-data, but the sense-data that occur at one time are often causally connected with those that occur at quite other times, and not, or at least not very closely, with those that occur at neighbouring times. If I look at the moon and immediately afterwards hear a train coming, there is no very close causal connection between my two sense-data; but if I look at the moon on two nights a week apart, there is a very close causal connection between the two sense-data. The simplest, or at least the easiest, statement of the connection is obtained by imagining a "real" moon which goes on whether I look at it or not, providing a series of _possible_ sense-data of which only those are actual which belong to moments when I choose to look at the moon.

But the degree of verification obtainable in this way is very small. It must be remembered that, at our present level of doubt, we are not at liberty to accept testimony. When we hear certain noises, which are those we should utter if we wished to express a certain thought, we assume that that thought, or one very like it, has been in another mind, and has given rise to the expression which we hear. If at the same time we see a body resembling our own, moving its lips as we move ours when we speak, we cannot resist the belief that it is alive, and that the feelings inside it continue when we are not looking at it. When we see our friend drop a weight

upon his toe, and hear him say--what we should say in similar circumstances, the phenomena _can_ no doubt be explained without assuming that he is anything but a series of shapes and noises seen and heard by us, but practically no man is so infected with philosophy as not to be quite certain that his friend has felt the same kind of pain as he himself would feel. We will consider the legitimacy of this belief presently; for the moment, I only wish to point out that it needs the same kind of justification as our belief that the moon exists when we do not see it, and that, without it, testimony heard or read is reduced to noises and shapes, and cannot be regarded as evidence of the facts which it reports. The verification of physics which is possible at our present level is, therefore, only that degree of verification which is possible by one man's unaided observations, which will not carry us very far towards the establishment of a whole science.

Before proceeding further, let us summarise the argument so far as it has gone. The problem is: "Can the existence of anything other than our own hard data be inferred from these data?" It is a mistake to state the problem in the form: "Can we know of the existence of anything other than ourselves and our states?" or: "Can we know of the existence of anything independent of ourselves?" because of the extreme difficulty of defining "self" and "independent" precisely. The felt passivity of sensation is irrelevant, since, even if it proved anything, it could only prove that sensations are caused by sensible objects. The natural _naive_ belief is that things seen persist, when unseen, exactly or approximately as they appeared when seen; but this belief tends to be dispelled by the fact that what common sense regards as the appearance of one object changes with what common sense regards as changes in the point of view and in the intervening medium, including in the latter our own sense-organs and nerves and brain. This fact, as just stated, assumes, however, the common-sense world of stable objects which it professes to call in question; hence, before we can discover its precise bearing on our problem, we must find a way of stating it which does not involve any of the assumptions which it is designed to render doubtful. What we then find, as the bare outcome of experience, is that gradual changes in certain sense-data are correlated with gradual changes in certain others, or (in the case of bodily motions) with the other sense-data themselves.

The assumption that sensible objects persist after they have ceased to be sensible--for example, that the hardness of a visible body, which has been discovered by touch, continues when the body is no longer touched--may be replaced by the statement that the _effects_ of sensible objects persist, _i.e._ that what happens now can only be accounted for, in many cases, by taking account of what happened at an earlier time. Everything that one man, by his own personal experience, can verify in the account of the world given by common sense and physics, will be explicable by some such means, since verification consists merely in the occurrence of an expected sense-datum. But what depends upon testimony, whether heard or read, cannot be explained in this way, since testimony depends upon the existence of minds other than our own, and thus requires a knowledge of something not given in sense. But before examining the question of our knowledge of other minds, let us return to the question of the thing-in-itself, namely, to the theory that what exists at times when we are not perceiving a given sensible object is something quite unlike that object, something which, together with us and our sense-organs, causes our sensations, but is never itself given in sensation.

The thing-in-itself, when we start from common-sense assumptions, is a fairly natural outcome of the difficulties due to the changing appearances of what is supposed to be one object. It is supposed that the table (for example) causes our sense-data of sight and touch, but must, since these are altered by the point of view and the intervening medium, be quite different from the sense-data to which it gives rise. There is, in this theory, a tendency to a confusion from which it derives some of its plausibility, namely, the confusion between a sensation as a psychical occurrence and its object. A patch of colour, even if it only exists when it is seen, is still something quite different from the seeing of it: the seeing of it is mental, but the patch of colour is not. This confusion, however, can be avoided without our necessarily abandoning the theory we are examining. The objection to it, I think, lies in its failure to realise the radical nature of the reconstruction demanded by the difficulties to which it points. We cannot speak legitimately of changes in the point of view and the intervening medium until we have already constructed some world more stable than that of momentary sensation. Our discussion of the blue spectacles and the walk round the table has, I hope, made this clear. But what remains far from clear is the nature of the reconstruction required.

Although we cannot rest content with the above theory, in the terms in which it is stated, we must nevertheless treat it with a certain respect, for it is in outline the theory upon which physical science and physiology are built, and it must, therefore, be susceptible of a true interpretation. Let us see how this is to be done.

The first thing to realise is that there are no such things as "illusions of sense." Objects of sense, even when they occur in dreams, are the most indubitably real objects known to us. What, then, makes us call them unreal in dreams? Merely the unusual nature of their connection with other objects of sense. I dream that I am in America, but I wake up and find myself in England without those

intervening days on the Atlantic which, alas! are inseparably connected with a "real" visit to America. Objects of sense are called "real" when they have the kind of connection with other objects of sense which experience has led us to regard as normal; when they fail in this, they are called "illusions." But what is illusory is only the inferences to which they give rise; in themselves, they are every bit as real as the objects of waking life. And conversely, the sensible objects of waking life must not be expected to have any more intrinsic reality than those of dreams. Dreams and waking life, in our first efforts at construction, must be treated with equal respect; it is only by some reality not _merely_ sensible that dreams can be condemned.

Accepting the indubitable momentary reality of objects of sense, the next thing to notice is the confusion underlying objections derived from their changeableness. As we walk round the table, its aspect changes; but it is thought impossible to maintain either that the table changes, or that its various aspects can all "really" exist in the same place. If we press one eyeball, we shall see two tables; but it is thought preposterous to maintain that there are "really" two tables. Such arguments, however, seem to involve the assumption that there can be something more real than objects of sense. If we see two tables, then there _are_ two visual tables. It is perfectly true that, at the same moment, we may discover by touch that there is only one tactile table. This makes us declare the two visual tables an illusion, because usually one visual object corresponds to one tactile object. But all that we are warranted in saying is that, in this case, the manner of correlation of touch and sight is unusual. Again, when the aspect of the table changes as we walk round it, and we are told there cannot be so many different aspects in the same place, the answer is simple: what does the critic of the table mean by "the same place"? The use of such a phrase presupposes that all our difficulties have been solved; as yet, we have no right to speak of a "place" except with reference to one given set of momentary sense-data. When all are changed by a bodily movement, no place remains the same as it was. Thus the difficulty, if it exists, has at least not been rightly stated.

We will now make a new start, adopting a different method. Instead of inquiring what is the minimum of assumption by which we can explain the world of sense, we will, in order to have a model hypothesis as a help for the imagination, construct one possible (not necessary) explanation of the facts. It may perhaps then be possible to pare away what is superfluous in our hypothesis, leaving a residue which may be regarded as the abstract answer to our problem.

Let us imagine that each mind looks out upon the world, as in Leibniz's monadology, from a point of view peculiar to itself; and for the sake of simplicity let us confine ourselves to the sense of sight, ignoring minds which are devoid of this sense. Each mind sees at each moment an immensely complex three-dimensional world; but there is absolutely nothing which is seen by two minds simultaneously. When we say that two people see the same thing, we always find that, owing to difference of point of view, there are differences, however slight, between their immediate sensible objects. (I am here assuming the validity of testimony, but as we are only constructing a _possible_ theory, that is a legitimate assumption.) The three-dimensional world seen by one mind therefore contains no place in common with that seen by another, for places can only be constituted by the things in or around them. Hence we may suppose, in spite of the differences between the different worlds, that each exists entire exactly as it is perceived, and might be exactly as it is even if it were not perceived. We may further suppose that there are an infinite number of such worlds which are in fact unperceived. If two men are sitting in a room, two somewhat similar worlds are perceived by them; if a third man enters and sits between them, a third world, intermediate between the two previous worlds, begins to be perceived. It is true that we cannot reasonably suppose just this world to have existed before, because it is conditioned by the sense-organs, nerves, and brain of the newly arrived man; but we can reasonably suppose that _some_ aspect of the universe existed from that point of view, though no one was perceiving it. The system consisting of all views of the universe perceived and unperceived, I shall call the system of "perspectives"; I shall confine the expression "private worlds" to such views of the universe as are actually perceived. Thus a "private world" is a perceived "perspective"; but there may be any number of unperceived perspectives.

Two men are sometimes found to perceive very similar perspectives, so similar that they can use the same words to describe them. They say they see the same table, because the differences between the two tables they see are slight and not practically important. Thus it is possible, sometimes, to establish a correlation by similarity between a great many of the things of one perspective, and a great many of the things of another. In case the similarity is very great, we say the points of view of the two perspectives are near together in space; but this space in which they are near together is totally different from the spaces inside the two perspectives. It is a relation between the perspectives, and is not in either of them; no one can perceive it, and if it is to be known it can be only by inference. Between two perceived perspectives which are similar, we can imagine a whole series of other perspectives, some at least unperceived, and such that between any two, however similar, there are others still more similar. In this way the space which consists of relations between perspectives can be rendered continuous, and (if we choose) three-dimensional.

We can now define the momentary common-sense "thing," as opposed to its momentary appearances. By the similarity of neighbouring perspectives, many objects in the one can be correlated with objects in the other, namely, with the similar objects.

Given an object in one perspective, form the system of all the objects correlated with it in all the perspectives; that system may be identified with the momentary common-sense "thing." Thus an aspect of a "thing" is a member of the system of aspects which _is_ the "thing" at that moment. (The correlation of the times of different perspectives raises certain complications, of the kind considered in the theory of relativity; but we may ignore these at present.) All the aspects of a thing are real, whereas the thing is a mere logical construction. It has, however, the merit of being neutral as between different points of view, and of being visible to more than one person, in the only sense in which it can ever be visible, namely, in the sense that each sees one of its aspects.

It will be observed that, while each perspective contains its own space, there is only one space in which the perspectives themselves are the elements. There are as many private spaces as there are perspectives; there are therefore at least as many as there are percipients, and there may be any number of others which have a merely material existence and are not seen by anyone. But there is only one perspective-space, whose elements are single perspectives, each with its own private space. We have now to explain how the private space of a single perspective is correlated with part of the one all-embracing perspective space.

Perspective space is the system of "points of view" of private spaces (perspectives), or, since "points of view" have not been defined, we may say it is the system of the private spaces themselves. These private spaces will each count as one point, or at any rate as one element, in perspective space. They are ordered by means of their similarities. Suppose, for example, that we start from one which contains the appearance of a circular disc, such as would be called a penny, and suppose this appearance, in the perspective in question, is circular, not elliptic. We can then form a whole series of perspectives containing a graduated series of circular aspects of varying sizes: for this purpose we only have to move (as we say) towards the penny or away from it. The perspectives in which the penny looks circular will be said to lie on a straight line in perspective space, and their order on this line will be that of the sizes of the circular aspects. Moreover--though this statement must be noticed and subsequently examined--the perspectives in which the penny looks big will be said to be nearer to the penny than those in which it looks small. It is to be remarked also that any other "thing" than our penny might have been chosen to define the relations of our perspectives in perspective space, and that experience shows that the same spatial order of perspectives would have resulted.

In order to explain the correlation of private spaces with perspective space, we have first to explain what is meant by "the place (in perspective space) where a thing is." For this purpose, let us again consider the penny which appears in many perspectives. We formed a straight line of perspectives in which the penny looked circular, and we agreed that those in which it looked larger were to be considered as nearer to the penny. We can form another straight line of perspectives in which the penny is seen end-on and looks like a straight line of a certain thickness. These two lines will meet in a certain place in perspective space, _i.e._ in a certain perspective, which may be defined as "the place (in perspective space) where the penny is." It is true that, in order to prolong our lines until they reach this place, we shall have to make use of other things besides the penny, because, so far as experience goes, the penny ceases to present any appearance after we have come so near to it that it touches the eye. But this raises no real difficulty, because the spatial order of perspectives is found empirically to be independent of the particular "things" chosen for defining the order. We can, for example, remove our penny and prolong each of our two straight lines up to their intersection by placing other pennies further off in such a way that the aspects of the one are circular where those of our original penny were circular, and the aspects of the other are straight where those of our original penny were straight. There will then be just one perspective in which one of the new pennies looks circular and the other straight. This will be, by definition, the place where the original penny was in perspective space.

The above is, of course, only a first rough sketch of the way in which our definition is to be reached. It neglects the size of the penny, and it assumes that we can remove the penny without being disturbed by any simultaneous changes in the positions of other things. But it is plain that such niceties cannot affect the principle, and can only introduce complications in its application.

Having now defined the perspective which is the place where a given thing is, we can understand what is meant by saying that the perspectives in which a thing looks large are nearer to the thing than those in which it looks small: they are, in fact, nearer to the perspective which is the place where the thing is.

We can now also explain the correlation between a private space and parts of perspective space. If there is an aspect of a given thing in a certain private space, then we correlate the place where this aspect is in the private space with the place where the thing is in perspective space.

We may define "here" as the place, in perspective space, which is occupied by our private world. Thus we can now understand what is meant by speaking of a thing as near to or far from "here." A thing is near to "here" if the place where it is is near to my

private world. We can also understand what is meant by saying that our private world is inside our head; for our private world is a place in perspective space, and may be part of the place where our head is.

It will be observed that _two_ places in perspective space are associated with every aspect of a thing: namely, the place where the thing is, and the place which is the perspective of which the aspect in question forms part. Every aspect of a thing is a member of two different classes of aspects, namely: (1) the various aspects of the thing, of which at most one appears in any given perspective; (2) the perspective of which the given aspect is a member, _i.e._ that in which the thing has the given aspect. The physicist naturally classifies aspects in the first way, the psychologist in the second. The two places associated with a single aspect correspond to the two ways of classifying it. We may distinguish the two places as that _at_ which, and that _from_ which, the aspect appears. The "place at which" is the place of the thing to which the aspect belongs; the "place from which" is the place of the perspective to which the aspect belongs.

Let us now endeavour to state the fact that the aspect which a thing presents at a given place is affected by the intervening medium. The aspects of a thing in different perspectives are to be conceived as spreading outwards from the place where the thing is, and undergoing various changes as they get further away from this place. The laws according to which they change cannot be stated if we only take account of the aspects that are near the thing, but require that we should also take account of the things that are at the places from which these aspects appear. This empirical fact can, therefore, be interpreted in terms of our construction.

We have now constructed a largely hypothetical picture of the world, which contains and places the experienced facts, including those derived from testimony. The world we have constructed can, with a certain amount of trouble, be used to interpret the crude facts of sense, the facts of physics, and the facts of physiology. It is therefore a world which _may_ be actual. It fits the facts, and there is no empirical evidence against it; it also is free from logical impossibilities. But have we any good reason to suppose that it is real? This brings us back to our original problem, as to the grounds for believing in the existence of anything outside my private world. What we have derived from our hypothetical construction is that there are no grounds _against_ the truth of this belief, but we have not derived any positive grounds in its favour. We will resume this inquiry by taking up again the question of testimony and the evidence for the existence of other minds.

It must be conceded to begin with that the argument in favour of the existence of other people's minds cannot be conclusive. A phantasm of our dreams will appear to have a mind--a mind to be annoying, as a rule. It will give unexpected answers, refuse to conform to our desires, and show all those other signs of intelligence to which we are accustomed in the acquaintances of our waking hours. And yet, when we are awake, we do not believe that the phantasm was, like the appearances of people in waking life, representative of a private world to which we have no direct access. If we are to believe this of the people we meet when we are awake, it must be on some ground short of demonstration, since it is obviously possible that what we call waking life may be only an unusually persistent and recurrent nightmare. It may be that our imagination brings forth all that other people seem to say to us, all that we read in books, all the daily, weekly, monthly, and quarterly journals that distract our thoughts, all the advertisements of soap and all the speeches of politicians. This _may_ be true, since it cannot be shown to be false, yet no one can really believe it. Is there any _logical_ ground for regarding this possibility as improbable? Or is there nothing beyond habit and prejudice?

The minds of other people are among our data, in the very wide sense in which we used the word at first. That is to say, when we first begin to reflect, we find ourselves already believing in them, not because of any argument, but because the belief is natural to us. It is, however, a psychologically derivative belief, since it results from observation of people's bodies; and along with other such beliefs, it does not belong to the hardest of hard data, but becomes, under the influence of philosophic reflection, just sufficiently questionable to make us desire some argument connecting it with the facts of sense.

The obvious argument is, of course, derived from analogy. Other people's bodies behave as ours do when we have certain thoughts and feelings; hence, by analogy, it is natural to suppose that such behaviour is connected with thoughts and feelings like our own. Someone says, "Look out!" and we find we are on the point of being killed by a motor-car; we therefore attribute the words we heard to the person in question having seen the motor-car first, in which case there are existing things of which we are not directly conscious. But this whole scene, with our inference, may occur in a dream, in which case the inference is generally considered to be mistaken. Is there anything to make the argument from analogy more cogent when we are (as we think) awake?

The analogy in waking life is only to be preferred to that in dreams on the ground of its greater extent and consistency. If a man were to dream every night about a set of people whom he never met by day, who had consistent characters and grew older with the lapse of years, he might, like the man in Calderon's play, find it difficult to decide which was the dream-world and which was the

so-called "real" world. It is only the failure of our dreams to form a consistent whole either with each other or with waking life that makes us condemn them. Certain uniformities are observed in waking life, while dreams seem quite erratic. The natural hypothesis would be that demons and the spirits of the dead visit us while we sleep; but the modern mind, as a rule, refuses to entertain this view, though it is hard to see what could be said against it. On the other hand, the mystic, in moments of illumination, seems to awaken from a sleep which has filled all his mundane life: the whole world of sense becomes phantasmal, and he sees, with the clarity and convincingness that belongs to our morning realisation after dreams, a world utterly different from that of our daily cares and troubles. Who shall condemn him? Who shall justify him? Or who shall justify the seeming solidity of the common objects among which we suppose ourselves to live?

The hypothesis that other people have minds must, I think, be allowed to be not susceptible of any very strong support from the analogical argument. At the same time, it is a hypothesis which systematises a vast body of facts and never leads to any consequences which there is reason to think false. There is therefore nothing to be said against its truth, and good reason to use it as a working hypothesis. When once it is admitted, it enables us to extend our knowledge of the sensible world by testimony, and thus leads to the system of private worlds which we assumed in our hypothetical construction. In actual fact, whatever we may try to think as philosophers, we cannot help believing in the minds of other people, so that the question whether our belief is justified has a merely speculative interest. And if it is justified, then there is no further difficulty of principle in that vast extension of our knowledge, beyond our own private data, which we find in science and common sense.

This somewhat meagre conclusion must not be regarded as the whole outcome of our long discussion. The problem of the connection of sense with objective reality has commonly been dealt with from a standpoint which did not carry initial doubt so far as we have carried it; most writers, consciously or unconsciously, have assumed that the testimony of others is to be admitted, and therefore (at least by implication) that others have minds. Their difficulties have arisen after this admission, from the differences in the appearance which one physical object presents to two people at the same time, or to one person at two times between which it cannot be supposed to have changed. Such difficulties have made people doubtful how far objective reality could be known by sense at all, and have made them suppose that there were positive arguments against the view that it can be so known. Our hypothetical construction meets these arguments, and shows that the account of the world given by common sense and physical science can be interpreted in a way which is logically unobjectionable, and finds a place for all the data, both hard and soft. It is this hypothetical construction, with its reconciliation of psychology and physics, which is the chief outcome of our discussion. Probably the construction is only in part necessary as an initial assumption, and can be obtained from more slender materials by the logical methods of which we shall have an example in the definitions of points, instants, and particles; but I do not yet know to what lengths this diminution in our initial assumptions can be carried.

LECTURE IV

THE WORLD OF PHYSICS AND THE WORLD OF SENSE

Among the objections to the reality of objects of sense, there is one which is derived from the apparent difference between matter as it appears in physics and things as they appear in sensation. Men of science, for the most part, are willing to condemn immediate data as "merely subjective," while yet maintaining the truth of the physics inferred from those data. But such an attitude, though it may be _capable_ of justification, obviously stands in need of it; and the only justification possible must be one which exhibits matter as a logical construction from sense-data--unless, indeed, there were some wholly _a priori_ principle by which unknown entities could be inferred from such as are known. It is therefore necessary to find some way of bridging the gulf between the world of physics and the world of sense, and it is this problem which will occupy us in the present lecture. Physicists appear to be unconscious of the gulf, while psychologists, who are conscious of it, have not the mathematical knowledge required for spanning it. The problem is difficult, and I do not know its solution in detail. All that I can hope to do is to make the problem felt, and to indicate the kind of methods by which a solution is to be sought.

Let us begin by a brief description of the two contrasted worlds. We will take first the world of physics, for, though the other world is given while the physical world is inferred, to us now the world of physics is the more familiar, the world of pure sense having become strange and difficult to rediscover. Physics started from the common-sense belief in fairly permanent and fairly rigid bodies--tables and chairs, stones, mountains, the earth and moon and sun. This common-sense belief, it should be noticed, is a piece of audacious metaphysical theorising; objects are not continually present to sensation, and it may be doubted whether they are there when they are not seen or felt. This problem, which has been acute since the time of Berkeley, is ignored by common

sense, and has therefore hitherto been ignored by physicists. We have thus here a first departure from the immediate data of sensation, though it is a departure merely by way of extension, and was probably made by our savage ancestors in some very remote prehistoric epoch.

But tables and chairs, stones and mountains, are not _quite_ permanent or _quite_ rigid. Tables and chairs lose their legs, stones are split by frost, and mountains are cleft by earthquakes and eruptions. Then there are other things, which seem material, and yet present almost no permanence or rigidity. Breath, smoke, clouds, are examples of such things--so, in a lesser degree, are ice and snow; and rivers and seas, though fairly permanent, are not in any degree rigid. Breath, smoke, clouds, and generally things that can be seen but not touched, were thought to be hardly real; to this day the usual mark of a ghost is that it can be seen but not touched. Such objects were peculiar in the fact that they seemed to disappear completely, not merely to be transformed into something else. Ice and snow, when they disappear, are replaced by water; and it required no great theoretical effort to invent the hypothesis that the water was the same thing as the ice and snow, but in a new form. Solid bodies, when they break, break into parts which are practically the same in shape and size as they were before. A stone can be hammered into a powder, but the powder consists of grains which retain the character they had before the pounding. Thus the ideal of absolutely rigid and absolutely permanent bodies, which early physicists pursued throughout the changing appearances, seemed attainable by supposing ordinary bodies to be composed of a vast number of tiny atoms. This billiard-ball view of matter dominated the imagination of physicists until quite modern times, until, in fact, it was replaced by the electromagnetic theory, which in its turn is developing into a new atomism. Apart from the special form of the atomic theory which was invented for the needs of chemistry, some kind of atomism dominated the whole of traditional dynamics, and was implied in every statement of its laws and axioms.

The pictorial accounts which physicists give of the material world as they conceive it undergo violent changes under the influence of modifications in theory which are much slighter than the layman might suppose from the alterations of the description. Certain features, however, have remained fairly stable. It is always assumed that there is _something_ indestructible which is capable of motion in space; what is indestructible is always very small, but does not always occupy a mere point in space. There is supposed to be one all-embracing space in which the motion takes place, and until lately we might have assumed one all-embracing time also. But the principle of relativity has given prominence to the conception of "local time," and has somewhat diminished men's confidence in the one even-flowing stream of time. Without dogmatising as to the ultimate outcome of the principle of relativity, however, we may safely say, I think, that it does not destroy the possibility of correlating different local times, and does not therefore have such far-reaching philosophical consequences as is sometimes supposed. In fact, in spite of difficulties as to measurement, the one all-embracing time still, I think, underlies all that physics has to say about motion. We thus have still in physics, as we had in Newton's time, a set of indestructible entities which may be called particles, moving relatively to each other in a single space and a single time.

The world of immediate data is quite different from this. Nothing is permanent; even the things that we think are fairly permanent, such as mountains, only become data when we see them, and are not immediately given as existing at other moments. So far from one all-embracing space being given, there are several spaces for each person, according to the different senses which give relations that may be called spatial. Experience teaches us to obtain one space from these by correlation, and experience, together with instinctive theorising, teaches us to correlate our spaces with those which we believe to exist in the sensible worlds of other people. The construction of a single time offers less difficulty so long as we confine ourselves to one person's private world, but the correlation of one private time with another is a matter of great difficulty. Thus, apart from any of the fluctuating hypotheses of physics, three main problems arise in connecting the world of physics with the world of sense, namely (1) the construction of permanent "things," (2) the construction of a single space, and (3) the construction of a single time. We will consider these three problems in succession.

(1) The belief in indestructible "things" very early took the form of atomism. The underlying motive in atomism was not, I think, any empirical success in interpreting phenomena, but rather an instinctive belief that beneath all the changes of the sensible world there must be something permanent and unchanging. This belief was, no doubt, fostered and nourished by its practical successes, culminating in the conservation of mass; but it was not produced by these successes. On the contrary, they were produced by it. Philosophical writers on physics sometimes speak as though the conservation of something or other were essential to the possibility of science, but this, I believe, is an entirely erroneous opinion. If the _a priori_ belief in permanence had not existed, the same laws which are now formulated in terms of this belief might just as well have been formulated without it. Why should we suppose that, when ice melts, the water which replaces it is the same thing in a new form? Merely because this supposition enables us to state the phenomena in a way which is consonant with our prejudices. What we really know is that, under certain

conditions of temperature, the appearance we call ice is replaced by the appearance we call water. We can give laws according to which the one appearance will be succeeded by the other, but there is no reason except prejudice for regarding both as appearances of the same substance.

One task, if what has just been said is correct, which confronts us in trying to connect the world of sense with the world of physics, is the task of reconstructing the conception of matter without the _a priori_ beliefs which historically gave rise to it. In spite of the revolutionary results of modern physics, the empirical successes of the conception of matter show that there must be some legitimate conception which fulfils roughly the same functions. The time has hardly come when we can state precisely what this legitimate conception is, but we can see in a general way what it must be like. For this purpose, it is only necessary to take our ordinary common-sense statements and reword them without the assumption of permanent substance. We say, for example, that things change gradually--sometimes very quickly, but not without passing through a continuous series of intermediate states. What this means is that, given any sensible appearance, there will usually be, _if we watch_, a continuous series of appearances connected with the given one, leading on by imperceptible gradations to the new appearances which common-sense regards as those of the same thing. Thus a thing may be defined as a certain series of appearances, connected with each other by continuity and by certain causal laws. In the case of slowly changing things, this is easily seen. Consider, say, a wall-paper which fades in the course of years. It is an effort not to conceive of it as one "thing" whose colour is slightly different at one time from what it is at another. But what do we really _know_ about it? We know that under suitable circumstances--_i.e._ when we are, as is said, "in the room"--we perceive certain colours in a certain pattern: not always precisely the same colours, but sufficiently similar to feel familiar. If we can state the laws according to which the colour varies, we can state all that is empirically verifiable; the assumption that there is a constant entity, the wall-paper, which "has" these various colours at various times, is a piece of gratuitous metaphysics. We may, if we like, _define_ the wall-paper as the series of its aspects. These are collected together by the same motives which led us to regard the wall-paper as one thing, namely a combination of sensible continuity and causal connection. More generally, a "thing" will be defined as a certain series of aspects, namely those which would commonly be said to be _of_ the thing. To say that a certain aspect is an aspect _of_ a certain thing will merely mean that it is one of those which, taken serially, _are_ the thing. Everything will then proceed as before: whatever was verifiable is unchanged, but our language is so interpreted as to avoid an unnecessary metaphysical assumption of permanence.

The above extrusion of permanent things affords an example of the maxim which inspires all scientific philosophising, namely "Occam's razor": _Entities are not to be multiplied without necessity._ In other words, in dealing with any subject-matter, find out what entities are undeniably involved, and state everything in terms of these entities. Very often the resulting statement is more complicated and difficult than one which, like common sense and most philosophy, assumes hypothetical entities whose existence there is no good reason to believe in. We find it easier to imagine a wall-paper with changing colours than to think merely of the series of colours; but it is a mistake to suppose that what is easy and natural in thought is what is most free from unwarrantable assumptions, as the case of "things" very aptly illustrates.

The above summary account of the genesis of "things," though it may be correct in outline, has omitted some serious difficulties which it is necessary briefly to consider. Starting from a world of helter-skelter sense-data, we wish to collect them into series, each of which can be regarded as consisting of the successive appearances of one "thing." There is, to begin with, some conflict between what common sense regards as one thing, and what physics regards an unchanging collection of particles. To common sense, a human body is one thing, but to science the matter composing it is continually changing. This conflict, however, is not very serious, and may, for our rough preliminary purpose, be largely ignored. The problem is: by what principles shall we select certain data from the chaos, and call them all appearances of the same thing?

A rough and approximate answer to this question is not very difficult. There are certain fairly stable collections of appearances, such as landscapes, the furniture of rooms, the faces of acquaintances. In these cases, we have little hesitation in regarding them on successive occasions as appearances of one thing or collection of things. But, as the _Comedy of Errors_ illustrates, we may be led astray if we judge by mere resemblance. This shows that something more is involved, for two different things may have any degree of likeness up to exact similarity.

Another insufficient criterion of one thing is _continuity_. As we have already seen, if we watch what we regard as one changing thing, we usually find its changes to be continuous so far as our senses can perceive. We are thus led to assume that, if we see two finitely different appearances at two different times, and if we have reason to regard them as belonging to the same thing, then there was a continuous series of intermediate states of that thing during the time when we were not observing it. And so it comes to be thought that continuity of change is necessary and sufficient to constitute one thing. But in fact it is neither. It is not _necessary_,

because the unobserved states, in the case where our attention has not been concentrated on the thing throughout, are purely hypothetical, and cannot possibly be our ground for supposing the earlier and later appearances to belong to the same thing; on the contrary, it is because we suppose this that we assume intermediate unobserved states. Continuity is also not sufficient, since we can, for example, pass by sensibly continuous gradations from any one drop of the sea to any other drop. The utmost we can say is that discontinuity during uninterrupted observation is as a rule a mark of difference between things, though even this cannot be said in such cases as sudden explosions.

The assumption of continuity is, however, successfully made in physics. This proves something, though not anything of very obvious utility to our present problem: it proves that nothing in the known world is inconsistent with the hypothesis that all changes are really continuous, though from too great rapidity or from our lack of observation they may not always appear continuous. In this hypothetical sense, continuity may be allowed to be a _necessary_ condition if two appearances are to be classed as appearances of the same thing. But it is not a _sufficient_ condition, as appears from the instance of the drops in the sea. Thus something more must be sought before we can give even the roughest definition of a "thing."

What is wanted further seems to be something in the nature of fulfilment of causal laws. This statement, as it stands, is very vague, but we will endeavour to give it precision. When I speak of "causal laws," I mean any laws which connect events at different times, or even, as a limiting case, events at the same time provided the connection is not logically demonstrable. In this very general sense, the laws of dynamics are causal laws, and so are the laws correlating the simultaneous appearances of one "thing" to different senses. The question is: How do such laws help in the definition of a "thing"?

To answer this question, we must consider what it is that is proved by the empirical success of physics. What is proved is that its hypotheses, though unverifiable where they go beyond sense-data, are at no point in contradiction with sense-data, but, on the contrary, are ideally such as to render all sense-data calculable from a sufficient collection of data all belonging to a given period of time. Now physics has found it empirically possible to collect sense-data into series, each series being regarded as belonging to one "thing," and behaving, with regard to the laws of physics, in a way in which series not belonging to one thing would in general not behave. If it is to be unambiguous whether two appearances belong to the same thing or not, there must be only one way of grouping appearances so that the resulting things obey the laws of physics. It would be very difficult to prove that this is the case, but for our present purposes we may let this point pass, and assume that there is only one way. We must include in our definition of a "thing" those of its aspects, if any, which are not observed. Thus we may lay down the following definition: _Things are those series of aspects which obey the laws of physics._ That such series exist is an empirical fact, which constitutes the verifiability of physics.

It may still be objected that the "matter" of physics is something other than series of sense-data. Sense-data, it may be said, belong to psychology and are, at any rate in some sense, subjective, whereas physics is quite independent of psychological considerations, and does not assume that its matter only exists when it is perceived.

To this objection there are two answers, both of some importance.

(a) We have been considering, in the above account, the question of the _verifiability_ of physics. Now verifiability is by no means the same thing as truth; it is, in fact, something far more subjective and psychological. For a proposition to be verifiable, it is not enough that it should be true, but it must also be such as we can _discover_ to be true. Thus verifiability depends upon our capacity for acquiring knowledge, and not only upon the objective truth. In physics, as ordinarily set forth, there is much that is unverifiable: there are hypotheses as to (A) how things would appear to a spectator in a place where, as it happens, there is no spectator; (B) how things would appear at times when, in fact, they are not appearing to anyone; (C) things which never appear at all. All these are introduced to simplify the statement of the causal laws, but none of them form an integral part of what is _known_ to be true in physics. This brings us to our second answer.

(b) If physics is to consist wholly of propositions known to be true, or at least capable of being proved or disproved, the three kinds of hypothetical entities we have just enumerated must all be capable of being exhibited as logical functions of sense-data. In order to show how this might possibly be done, let us recall the hypothetical Leibnizian universe of Lecture III. In that universe, we had a number of perspectives, two of which never had any entity in common, but often contained entities which could be sufficiently correlated to be regarded as belonging to the same thing. We will call one of these an "actual" private world when there is an actual spectator to which it appears, and "ideal" when it is merely constructed on principles of continuity. A physical thing consists, at each instant, of the whole set of its aspects at that instant, in all the different worlds; thus a momentary state of a thing is a whole set of

aspects. An "ideal" appearance will be an aspect merely calculated, but not actually perceived by any spectator. An "ideal" state of a thing will be a state at a moment when all its appearances are ideal. An ideal thing will be one whose states at all times are ideal. Ideal appearances, states, and things, since they are calculated, must be functions of actual appearances, states, and things; in fact, ultimately, they must be functions of actual appearances. Thus it is unnecessary, for the enunciation of the laws of physics, to assign any reality to ideal elements: it is enough to accept them as logical constructions, provided we have means of knowing how to determine when they become actual. This, in fact, we have with some degree of approximation; the starry heaven, for instance, becomes actual whenever we choose to look at it. It is open to us to believe that the ideal elements exist, and there can be no reason for _dis_believing this; but unless in virtue of some _a priori_ law we cannot _know_ it, for empirical knowledge is confined to what we actually observe.

(2) The three main conceptions of physics are space, time, and matter. Some of the problems raised by the conception of matter have been indicated in the above discussion of "things." But space and time also raise difficult problems of much the same kind, namely, difficulties in reducing the haphazard untidy world of immediate sensation to the smooth orderly world of geometry and kinematics. Let us begin with the consideration of space.

People who have never read any psychology seldom realise how much mental labour has gone into the construction of the one all-embracing space into which all sensible objects are supposed to fit. Kant, who was unusually ignorant of psychology, described space as "an infinite given whole," whereas a moment's psychological reflection shows that a space which is infinite is not given, while a space which can be called given is not infinite. What the nature of "given" space really is, is a difficult question, upon which psychologists are by no means agreed. But some general remarks may be made, which will suffice to show the problems, without taking sides on any psychological issue still in debate.

The first thing to notice is that different senses have different spaces. The space of sight is quite different from the space of touch: it is only by experience in infancy that we learn to correlate them. In later life, when we see an object within reach, we know how to touch it, and more or less what it will feel like; if we touch an object with our eyes shut, we know where we should have to look for it, and more or less what it would look like. But this knowledge is derived from early experience of the correlation of certain kinds of touch-sensations with certain kinds of sight-sensations. The one space into which both kinds of sensations fit is an intellectual construction, not a datum. And besides touch and sight, there are other kinds of sensation which give other, though less important spaces: these also have to be fitted into the one space by means of experienced correlations. And as in the case of things, so here: the one all-embracing space, though convenient as a way of speaking, need not be supposed really to exist. All that experience makes certain is the several spaces of the several senses, correlated by empirically discovered laws. The one space may turn out to be valid as a logical construction, compounded of the several spaces, but there is no good reason to assume its independent metaphysical reality.

Another respect in which the spaces of immediate experience differ from the space of geometry and physics is in regard to _points_. The space of geometry and physics consists of an infinite number of points, but no one has ever seen or touched a point. If there are points in a sensible space, they must be an inference. It is not easy to see any way in which, as independent entities, they could be validly inferred from the data; thus here again, we shall have, if possible, to find some logical construction, some complex assemblage of immediately given objects, which will have the geometrical properties required of points. It is customary to think of points as simple and infinitely small, but geometry in no way demands that we should think of them in this way. All that is necessary for geometry is that they should have mutual relations possessing certain enumerated abstract properties, and it may be that an assemblage of data of sensation will serve this purpose. Exactly how this is to be done, I do not yet know, but it seems fairly certain that it can be done.

The following illustrative method, simplified so as to be easily manipulated, has been invented by Dr Whitehead for the purpose of showing how points might be manufactured from sense-data. We have first of all to observe that there are no infinitesimal sense-data: any surface we can see, for example, must be of some finite extent. But what at first appears as one undivided whole is often found, under the influence of attention, to split up into parts contained within the whole. Thus one spatial object may be contained within another, and entirely enclosed by the other. This relation of enclosure, by the help of some very natural hypotheses, will enable us to define a "point" as a certain class of spatial objects, namely all those (as it will turn out in the end) which would naturally be said to contain the point. In order to obtain a definition of a "point" in this way, we proceed as follows:

Given any set of volumes or surfaces, they will not in general converge into one point. But if they get smaller and smaller, while of any two of the set there is always one that encloses the other, then we begin to have the kind of conditions which would enable us

to treat them as having a point for their limit. The hypotheses required for the relation of enclosure are that (1) it must be transitive; (2) of two _different_ spatial objects, it is impossible for each to enclose the other, but a single spatial object always encloses itself; (3) any set of spatial objects such that there is at least one spatial object enclosed by them all has a lower limit or minimum, _i.e._ an object enclosed by all of them and enclosing all objects which are enclosed by all of them; (4) to prevent trivial exceptions, we must add that there are to be instances of enclosure, _i.e._ there are really to be objects of which one encloses the other. When an enclosure-relation has these properties, we will call it a "point-producer." Given any relation of enclosure, we will call a set of objects an "enclosure-series" if, of any two of them, one is contained in the other. We require a condition which shall secure that an enclosure-series converges to a point, and this is obtained as follows: Let our enclosure-series be such that, given any other enclosure-series of which there are members enclosed in any arbitrarily chosen member of our first series, then there are members of our first series enclosed in any arbitrarily chosen member of our second series. In this case, our first enclosure-series may be called a "punctual enclosure-series." Then a "point" is all the objects which enclose members of a given punctual enclosure-series. In order to ensure infinite divisibility, we require one further property to be added to those defining point-producers, namely that any object which encloses itself also encloses an object other than itself. The "points" generated by point-producers with this property will be found to be such as geometry requires.

(3) The question of time, so long as we confine ourselves to one private world, is rather less complicated than that of space, and we can see pretty clearly how it might be dealt with by such methods as we have been considering. Events of which we are conscious do not last merely for a mathematical instant, but always for some finite time, however short. Even if there be a physical world such as the mathematical theory of motion supposes, impressions on our sense-organs produce sensations which are not merely and strictly instantaneous, and therefore the objects of sense of which we are immediately conscious are not strictly instantaneous. Instants, therefore, are not among the data of experience, and, if legitimate, must be either inferred or constructed. It is difficult to see how they can be validly inferred; thus we are left with the alternative that they must be constructed. How is this to be done?

Immediate experience provides us with two time-relations among events: they may be simultaneous, or one may be earlier and the other later. These two are both part of the crude data; it is not the case that only the events are given, and their time-order is added by our subjective activity. The time-order, within certain limits, is as much given as the events. In any story of adventure you will find such passages as the following: "With a cynical smile he pointed the revolver at the breast of the dauntless youth. 'At the word _three_ I shall fire,' he said. The words one and two had already been spoken with a cool and deliberate distinctness. The word _three_ was forming on his lips. At this moment a blinding flash of lightning rent the air." Here we have simultaneity--not due, as Kant would have us believe, to the subjective mental apparatus of the dauntless youth, but given as objectively as the revolver and the lightning. And it is equally given in immediate experience that the words _one_ and _two_ come earlier than the flash. These time-relations hold between events which are not strictly instantaneous. Thus one event may begin sooner than another, and therefore be before it, but may continue after the other has begun, and therefore be also simultaneous with it. If it persists after the other is over, it will also be later than the other. Earlier, simultaneous, and later, are not inconsistent with each other when we are concerned with events which last for a finite time, however short; they only become inconsistent when we are dealing with something instantaneous.

It is to be observed that we cannot give what may be called _absolute_ dates, but only dates determined by events. We cannot point to a time itself, but only to some event occurring at that time. There is therefore no reason in experience to suppose that there are times as opposed to events: the events, ordered by the relations of simultaneity and succession, are all that experience provides. Hence, unless we are to introduce superfluous metaphysical entities, we must, in defining what mathematical physics can regard as an instant, proceed by means of some construction which assumes nothing beyond events and their temporal relations.

If we wish to assign a date exactly by means of events, how shall we proceed? If we take any one event, we cannot assign our date exactly, because the event is not instantaneous, that is to say, it may be simultaneous with two events which are not simultaneous with each other. In order to assign a date exactly, we must be able, theoretically, to determine whether any given event is before, at, or after this date, and we must know that any other date is either before or after this date, but not simultaneous with it. Suppose, now, instead of taking one event A, we take two events A and B, and suppose A and B partly overlap, but B ends before A ends. Then an event which is simultaneous with both A and B must exist during the time when A and B overlap; thus we have come rather nearer to a precise date than when we considered A and B alone. Let C be an event which is simultaneous with both A and B, but which ends before either A or B has ended. Then an event which is simultaneous with A and B and C must exist during the time when all three overlap, which is a still shorter time. Proceeding in this way, by taking more and more events, a new event which is dated as simultaneous with all of them becomes gradually more and more accurately dated. This suggests a way by which

a completely accurate date can be defined.

A_____

B_____

C_____

Let us take a group of events of which any two overlap, so that there is some time, however short, when they all exist. If there is any other event which is simultaneous with all of these, let us add it to the group; let us go on until we have constructed a group such that no event outside the group is simultaneous with all of them, but all the events inside the group are simultaneous with each other. Let us define this whole group as an instant of time. It remains to show that it has the properties we expect of an instant.

What are the properties we expect of instants? First, they must form a series: of any two, one must be before the other, and the other must be not before the one; if one is before another, and the other before a third, the first must be before the third. Secondly, every event must be at a certain number of instants; two events are simultaneous if they are at the same instant, and one is before the other if there is an instant, at which the one is, which is earlier than some instant at which the other is. Thirdly, if we assume that there is always some change going on somewhere during the time when any given event persists, the series of instants ought to be compact, _i.e._ given any two instants, there ought to be other instants between them. Do instants, as we have defined them, have these properties?

We shall say that an event is "at" an instant when it is a member of the group by which the instant is constituted; and we shall say that one instant is before another if the group which is the one instant contains an event which is earlier than, but not simultaneous with, some event in the group which is the other instant. When one event is earlier than, but not simultaneous with another, we shall say that it "wholly precedes" the other. Now we know that of two events which are not simultaneous, there must be one which wholly precedes the other, and in that case the other cannot also wholly precede the one; we also know that, if one event wholly precedes another, and the other wholly precedes a third, then the first wholly precedes the third. From these facts it is easy to deduce that the instants as we have defined them form a series.

We have next to show that every event is "at" at least one instant, _i.e._ that, given any event, there is at least one class, such as we used in defining instants, of which it is a member. For this purpose, consider all the events which are simultaneous with a given event, and do not begin later, _i.e._ are not wholly after anything simultaneous with it. We will call these the "initial contemporaries" of the given event. It will be found that this class of events is the first instant at which the given event exists, provided every event wholly after some contemporary of the given event is wholly after some _initial_ contemporary of it.

Finally, the series of instants will be compact if, given any two events of which one wholly precedes the other, there are events wholly after the one and simultaneous with something wholly before the other. Whether this is the case or not, is an empirical question; but if it is not, there is no reason to expect the time-series to be compact.[17]

[17] The assumptions made concerning time-relations in the above are as follows:--

I. In order to secure that instants form a series, we assume:

(a) No event wholly precedes itself. (An "event" is defined as whatever is simultaneous with something or other.)

(b) If one event wholly precedes another, and the other wholly precedes a third, then the first wholly precedes the third.

(c) If one event wholly precedes another, it is not simultaneous with it.

(d) Of two events which are not simultaneous, one must wholly precede the other.

II. In order to secure that the initial contemporaries of a given event should form an instant, we assume:

(e) An event wholly after some contemporary of a given event is wholly after some _initial_ contemporary of the given event.

III. In order to secure that the series of instants shall be compact, we assume:

(f) If one event wholly precedes another, there is an event wholly after the one and simultaneous with something wholly before the other.

This assumption entails the consequence that if one event covers the whole of a stretch of time immediately preceding another event, then it must have at least one instant in common with the other event; _i.e._ it is impossible for one event to cease just before another begins. I do not know whether this should be regarded as inadmissible. For a mathematico-logical treatment of the above topics, _cf._ N. Wilner, "A Contribution to the Theory of Relative Position," _Proc. Camb. Phil. Soc._, xvii. 5, pp. 441-449.

Thus our definition of instants secures all that mathematics requires, without having to assume the existence of any disputable metaphysical entities.

Instants may also be defined by means of the enclosure-relation, exactly as was done in the case of points. One object will be temporally enclosed by another when it is simultaneous with the other, but not before or after it. Whatever encloses temporally or is enclosed temporally we shall call an "event." In order that the relation of temporal enclosure may be a "point-producer," we require (1) that it should be transitive, _i.e._ that if one event encloses another, and the other a third, then the first encloses the third; (2) that every event encloses itself, but if one event encloses another different event, then the other does not enclose the one; (3) that given any set of events such that there is at least one event enclosed by all of them, then there is an event enclosing all that they all enclose, and itself enclosed by all of them; (4) that there is at least one event. To ensure infinite divisibility, we require also that every event should enclose events other than itself. Assuming these characteristics, temporal enclosure is an infinitely divisible point-producer. We can now form an "enclosure-series" of events, by choosing a group of events such that of any two there is one which encloses the other; this will be a "punctual enclosure-series" if, given any other enclosure-series such that every member of our first series encloses some member of our second, then every member of our second series encloses some member of our first. Then an "instant" is the class of all events which enclose members of a given punctual enclosure-series.

The correlation of the times of different private worlds so as to produce the one all-embracing time of physics is a more difficult matter. We saw, in Lecture III., that different private worlds often contain correlated appearances, such as common sense would regard as appearances of the same "thing." When two appearances in different worlds are so correlated as to belong to one momentary "state" of a thing, it would be natural to regard them as simultaneous, and as thus affording a simple means of correlating different private times. But this can only be regarded as a first approximation. What we call one sound will be heard sooner by people near the source of the sound than by people further from it, and the same applies, though in a less degree, to light. Thus two correlated appearances in different worlds are not necessarily to be regarded as occurring at the same date in physical time, though they will be parts of one momentary state of a thing. The correlation of different private times is regulated by the desire to secure the simplest possible statement of the laws of physics, and thus raises rather complicated technical problems; but from the point of view of philosophical theory, there is no very serious difficulty of principle involved.

The above brief outline must not be regarded as more than tentative and suggestive. It is intended merely to show the kind of way in which, given a world with the kind of properties that psychologists find in the world of sense, it may be possible, by means of purely logical constructions, to make it amenable to mathematical treatment by defining series or classes of sense-data which can be called respectively particles, points, and instants. If such constructions are possible, then mathematical physics is applicable to the real world, in spite of the fact that its particles, points, and instants are not to be found among actually existing entities.

The problem which the above considerations are intended to elucidate is one whose importance and even existence has been concealed by the unfortunate separation of different studies which prevails throughout the civilised world. Physicists, ignorant and contemptuous of philosophy, have been content to assume their particles, points, and instants in practice, while conceding, with ironical politeness, that their concepts laid no claim to metaphysical validity. Metaphysicians, obsessed by the idealistic opinion that only mind is real, and the Parmenidean belief that the real is unchanging, repeated one after another the supposed contradictions in the notions of matter, space, and time, and therefore naturally made no endeavour to invent a tenable theory of particles, points, and instants. Psychologists, who have done invaluable work in bringing to light the chaotic nature of the crude materials supplied by unmanipulated sensation, have been ignorant of mathematics and modern logic, and have therefore been content to say that matter, space, and time are "intellectual constructions," without making any attempt to show in detail either how the intellect can construct them, or what secures the practical validity which physics shows them to possess. Philosophers, it is to be hoped, will come to recognise that they cannot achieve any solid success in such problems without some slight knowledge of logic, mathematics, and physics; meanwhile, for want of students with the necessary equipment, this vital problem remains unattempted and unknown.

There are, it is true, two authors, both physicists, who have done something, though not much, to bring about a recognition of the problem as one demanding study. These two authors are Poincare and Mach, Poincare especially in his _Science and

Hypothesis_, Mach especially in his _Analysis of Sensations_. Both of them, however, admirable as their work is, seem to me to suffer from a general philosophical bias. Poincare is Kantian, while Mach is ultra-empiricist; with Poincare almost all the mathematical part of physics is merely conventional, while with Mach the sensation as a mental event is identified with its object as a part of the physical world. Nevertheless, both these authors, and especially Mach, deserve mention as having made serious contributions to the consideration of our problem.

When a point or an instant is defined as a class of sensible qualities, the first impression produced is likely to be one of wild and wilful paradox. Certain considerations apply here, however, which will again be relevant when we come to the definition of numbers. There is a whole type of problems which can be solved by such definitions, and almost always there will be at first an effect of paradox. Given a set of objects any two of which have a relation of the sort called "symmetrical and transitive," it is almost certain that we shall come to regard them as all having some common quality, or as all having the same relation to some one object outside the set. This kind of case is important, and I shall therefore try to make it clear even at the cost of some repetition of previous definitions.

A relation is said to be "symmetrical" when, if one term has this relation to another, then the other also has it to the one. Thus "brother or sister" is a "symmetrical" relation: if one person is a brother or a sister of another, then the other is a brother or sister of the one. Simultaneity, again, is a symmetrical relation; so is equality in size. A relation is said to be "transitive" when, if one term has this relation to another, and the other to a third, then the one has it to the third. The symmetrical relations mentioned just now are also transitive--provided, in the case of "brother or sister," we allow a person to be counted as his or her own brother or sister, and provided, in the case of simultaneity, we mean complete simultaneity, _i.e._ beginning and ending together.

But many relations are transitive without being symmetrical--for instance, such relations as "greater," "earlier," "to the right of," "ancestor of," in fact all such relations as give rise to series. Other relations are symmetrical without being transitive--for example, difference in any respect. If A is of a different age from B, and B of a different age from C, it does not follow that A is of a different age from C. Simultaneity, again, in the case of events which last for a finite time, will not necessarily be transitive if it only means that the times of the two events overlap. If A ends just after B has begun, and B ends just after C has begun, A and B will be simultaneous in this sense, and so will B and C, but A and C may well not be simultaneous.

All the relations which can naturally be represented as equality in any respect, or as possession of a common property, are transitive and symmetrical--this applies, for example, to such relations as being of the same height or weight or colour. Owing to the fact that possession of a common property gives rise to a transitive symmetrical relation, we come to imagine that wherever such a relation occurs it must be due to a common property. "Being equally numerous" is a transitive symmetrical relation of two collections; hence we imagine that both have a common property, called their number. "Existing at a given instant" (in the sense in which we defined an instant) is a transitive symmetrical relation; hence we come to think that there really is an instant which confers a common property on all the things existing at that instant. "Being states of a given thing" is a transitive symmetrical relation; hence we come to imagine that there really is a thing, other than the series of states, which accounts for the transitive symmetrical relation. In all such cases, the class of terms that have the given transitive symmetrical relation to a given term will fulfil all the formal requisites of a common property of all the members of the class. Since there certainly is the class, while any other common property may be illusory, it is prudent, in order to avoid needless assumptions, to substitute the class for the common property which would be ordinarily assumed. This is the reason for the definitions we have adopted, and this is the source of the apparent paradoxes. No harm is done if there are such common properties as language assumes, since we do not deny them, but merely abstain from asserting them. But if there are not such common properties in any given case, then our method has secured us against error. In the absence of special knowledge, therefore, the method we have adopted is the only one which is safe, and which avoids the risk of introducing fictitious metaphysical entities.

LECTURE V

THE THEORY OF CONTINUITY

The theory of continuity, with which we shall be occupied in the present lecture, is, in most of its refinements and developments, a purely mathematical subject--very beautiful, very important, and very delightful, but not, strictly speaking, a part of philosophy. The logical basis of the theory alone belongs to philosophy, and alone will occupy us to-night. The way the problem of continuity enters into philosophy is, broadly speaking, the following: Space and time are treated by mathematicians as consisting of points and instants, but they also have a property, easier to feel than to define, which is called continuity, and is thought by many philosophers

to be destroyed when they are resolved into points and instants. Zeno, as we shall see, proved that analysis into points and instants was impossible if we adhered to the view that the number of points or instants in a finite space or time must be finite. Later philosophers, believing infinite number to be self-contradictory, have found here an antinomy: Spaces and times could not consist of a _finite_ number of points and instants, for such reasons as Zeno's; they could not consist of an _infinite_ number of points and instants, because infinite numbers were supposed to be self-contradictory. Therefore spaces and times, if real at all, must not be regarded as composed of points and instants.

But even when points and instants, as independent entities, are discarded, as they were by the theory advocated in our last lecture, the problems of continuity, as I shall try to show presently, remain, in a practically unchanged form. Let us therefore, to begin with, admit points and instants, and consider the problems in connection with this simpler or at least more familiar hypothesis.

The argument against continuity, in so far as it rests upon the supposed difficulties of infinite numbers, has been disposed of by the positive theory of the infinite, which will be considered in Lecture VII. But there remains a feeling--of the kind that led Zeno to the contention that the arrow in its flight is at rest--which suggests that points and instants, even if they are infinitely numerous, can only give a jerky motion, a succession of different immobilities, not the smooth transitions with which the senses have made us familiar. This feeling is due, I believe, to a failure to realise imaginatively, as well as abstractly, the nature of continuous series as they appear in mathematics. When a theory has been apprehended logically, there is often a long and serious labour still required in order to _feel_ it: it is necessary to dwell upon it, to thrust out from the mind, one by one, the misleading suggestions of false but more familiar theories, to acquire the kind of intimacy which, in the case of a foreign language, would enable us to think and dream in it, not merely to construct laborious sentences by the help of grammar and dictionary. It is, I believe, the absence of this kind of intimacy which makes many philosophers regard the mathematical doctrine of continuity as an inadequate explanation of the continuity which we experience in the world of sense.

In the present lecture, I shall first try to explain in outline what the mathematical theory of continuity is in its philosophically important essentials. The application to actual space and time will not be in question to begin with. I do not see any reason to suppose that the points and instants which mathematicians introduce in dealing with space and time are actual physically existing entities, but I do see reason to suppose that the continuity of actual space and time may be more or less analogous to mathematical continuity. The theory of mathematical continuity is an abstract logical theory, not dependent for its validity upon any properties of actual space and time. What is claimed for it is that, when it is understood, certain characteristics of space and time, previously very hard to analyse, are found not to present any logical difficulty. What we know empirically about space and time is insufficient to enable us to decide between various mathematically possible alternatives, but these alternatives are all fully intelligible and fully adequate to the observed facts. For the present, however, it will be well to forget space and time and the continuity of sensible change, in order to return to these topics equipped with the weapons provided by the abstract theory of continuity.

Continuity, in mathematics, is a property only possible to a _series_ of terms, _i.e._ to terms arranged in an order, so that we can say of any two that one comes _before_ the other. Numbers in order of magnitude, the points on a line from left to right, the moments of time from earlier to later, are instances of series. The notion of order, which is here introduced, is one which is not required in the theory of cardinal number. It is possible to know that two classes have the same number of terms without knowing any order in which they are to be taken. We have an instance of this in such a case as English husbands and English wives: we can see that there must be the same number of husbands as of wives, without having to arrange them in a series. But continuity, which we are now to consider, is essentially a property of an order: it does not belong to a set of terms in themselves, but only to a set in a certain order. A set of terms which can be arranged in one order can always also be arranged in other orders, and a set of terms which can be arranged in a continuous order can always also be arranged in orders which are not continuous. Thus the essence of continuity must not be sought in the nature of the set of terms, but in the nature of their arrangement in a series.

Mathematicians have distinguished different degrees of continuity, and have confined the word "continuous," for technical purposes, to series having a certain high degree of continuity. But for philosophical purposes, all that is important in continuity is introduced by the lowest degree of continuity, which is called "compactness." A series is called "compact" when no two terms are consecutive, but between any two there are others. One of the simplest examples of a compact series is the series of fractions in order of magnitude. Given any two fractions, however near together, there are other fractions greater than the one and smaller than the other, and therefore no two fractions are consecutive. There is no fraction, for example, which is next after 1/2: if we choose some fraction which is very little greater than 1/2, say 51/100 we can find others, such as 101/200, which are nearer to 1/2. Thus between any two fractions, however little they differ, there are an infinite number of other fractions. Mathematical space and time

also have this property of compactness, though whether actual space and time have it is a further question, dependent upon empirical evidence, and probably incapable of being answered with certainty.

In the case of abstract objects such as fractions, it is perhaps not very difficult to realise the logical possibility of their forming a compact series. The difficulties that might be felt are those of infinity, for in a compact series the number of terms between any two given terms must be infinite. But when these difficulties have been solved, the mere compactness in itself offers no great obstacle to the imagination. In more concrete cases, however, such as motion, compactness becomes much more repugnant to our habits of thought. It will therefore be desirable to consider explicitly the mathematical account of motion, with a view to making its logical possibility felt. The mathematical account of motion is perhaps artificially simplified when regarded as describing what actually occurs in the physical world; but what actually occurs must be capable, by a certain amount of logical manipulation, of being brought within the scope of the mathematical account, and must, in its analysis, raise just such problems as are raised in their simplest form by this account. Neglecting, therefore, for the present, the question of its physical adequacy, let us devote ourselves merely to considering its possibility as a formal statement of the nature of motion.

In order to simplify our problem as much as possible, let us imagine a tiny speck of light moving along a scale. What do we mean by saying that the motion is continuous? It is not necessary for our purposes to consider the whole of what the mathematician means by this statement: only part of what he means is philosophically important. One part of what he means is that, if we consider any two positions of the speck occupied at any two instants, there will be other intermediate positions occupied at intermediate instants. However near together we take the two positions, the speck will not jump suddenly from the one to the other, but will pass through an infinite number of other positions on the way. Every distance, however small, is traversed by passing through all the infinite series of positions between the two ends of the distance.

But at this point imagination suggests that we may describe the continuity of motion by saying that the speck always passes from one position at one instant to _the next_ position at _the next_ instant. As soon as we say this or imagine it, we fall into error, because there is no _next_ point or _next_ instant. If there were, we should find Zeno's paradoxes, in some form, unavoidable, as will appear in our next lecture. One simple paradox may serve as an illustration. If our speck is in motion along the scale throughout the whole of a certain time, it cannot be at the same point at two consecutive instants. But it cannot, from one instant to the next, travel further than from one point to the next, for if it did, there would be no instant at which it was in the positions intermediate between that at the first instant and that at the next, and we agreed that the continuity of motion excludes the possibility of such sudden jumps. It follows that our speck must, so long as it moves, pass from one point at one instant to the next point at the next instant. Thus there will be just one perfectly definite velocity with which all motions must take place: no motion can be faster than this, and no motion can be slower. Since this conclusion is false, we must reject the hypothesis upon which it is based, namely that there are consecutive points and instants.[18] Hence the continuity of motion must not be supposed to consist in a body's occupying consecutive positions at consecutive times.

[18] The above paradox is essentially the same as Zeno's argument of the stadium which will be considered in our next lecture.

The difficulty to imagination lies chiefly, I think, in keeping out the suggestion of _infinitesimal_ distances and times. Suppose we halve a given distance, and then halve the half, and so on, we can continue the process as long as we please, and the longer we continue it, the smaller the resulting distance becomes. This infinite divisibility seems, at first sight, to imply that there are infinitesimal distances, _i.e._ distances so small that any finite fraction of an inch would be greater. This, however, is an error. The continued bisection of our distance, though it gives us continually smaller distances, gives us always _finite_ distances. If our original distance was an inch, we reach successively half an inch, a quarter of an inch, an eighth, a sixteenth, and so on; but every one of this infinite series of diminishing distances is finite. "But," it may be said, "_in the end_ the distance will grow infinitesimal." No, because there is no end. The process of bisection is one which can, theoretically, be carried on for ever, without any last term being attained. Thus infinite divisibility of distances, which must be admitted, does not imply that there are distances so small that any finite distance would be larger.

It is easy, in this kind of question, to fall into an elementary logical blunder. Given any finite distance, we can find a smaller distance; this may be expressed in the ambiguous form "there is a distance smaller than any finite distance." But if this is then interpreted as meaning "there is a distance such that, whatever finite distance may be chosen, the distance in question is smaller," then the statement is false. Common language is ill adapted to expressing matters of this kind, and philosophers who have been dependent on it have frequently been misled by it.

In a continuous motion, then, we shall say that at any given instant the moving body occupies a certain position, and at other instants it occupies other positions; the interval between any two instants and between any two positions is always finite, but the continuity of the motion is shown in the fact that, however near together we take the two positions and the two instants, there are an infinite number of positions still nearer together, which are occupied at instants that are also still nearer together. The moving body never jumps from one position to another, but always passes by a gradual transition through an infinite number of intermediaries. At a given instant, it is where it is, like Zeno's arrow;[19] but we cannot say that it is at rest at the instant, since the instant does not last for a finite time, and there is not a beginning and end of the instant with an interval between them. Rest consists in being in the same position at all the instants throughout a certain finite period, however short; it does not consist simply in a body's being where it is at a given instant. This whole theory, as is obvious, depends upon the nature of compact series, and demands, for its full comprehension, that compact series should have become familiar and easy to the imagination as well as to deliberate thought.

[19] See next lecture.

What is required may be expressed in mathematical language by saying that the position of a moving body must be a continuous function of the time. To define accurately what this means, we proceed as follows. Consider a particle which, at the moment _t_, is at the point P. Choose now any small portion P1P2 of the path of the particle, this portion being one which contains P. We say then that, if the motion of the particle is continuous at the time _t_, it must be possible to find two instants _t_1, _t_2, one earlier than _t_ and one later, such that throughout the whole time from _t_1 to _t_2 (both included), the particle lies between P1 and P2. And we say that this must still hold however small we make the portion P1P2. When this is the case, we say that the motion is continuous at the time _t_; and when the motion is continuous at all times, we say that the motion as a whole is continuous. It is obvious that if the particle were to jump suddenly from P to some other point Q, our definition would fail for all intervals P1P2 which were too small to include Q. Thus our definition affords an analysis of the continuity of motion, while admitting points and instants and denying infinitesimal distances in space or periods in time.

P1 P P2 Q ------|----|----|----|------>

Philosophers, mostly in ignorance of the mathematician's analysis, have adopted other and more heroic methods of dealing with the _prima facie_ difficulties of continuous motion. A typical and recent example of philosophic theories of motion is afforded by Bergson, whose views on this subject I have examined elsewhere.[20]

[20] _Monist_, July 1912, pp. 337-341.

Apart from definite arguments, there are certain feelings, rather than reasons, which stand in the way of an acceptance of the mathematical account of motion. To begin with, if a body is moving at all fast, we _see_ its motion just as we see its colour. A _slow_ motion, like that of the hour-hand of a watch, is only known in the way which mathematics would lead us to expect, namely by observing a change of position after a lapse of time; but, when we observe the motion of the second-hand, we do not merely see first one position and then another--we see something as directly sensible as colour. What is this something that we see, and that we call visible motion? Whatever it is, it is _not_ the successive occupation of successive positions: something beyond the mathematical theory of motion is required to account for it. Opponents of the mathematical theory emphasise this fact. "Your theory," they say, "may be very logical, and might apply admirably to some other world; but in this actual world, actual motions are quite different from what your theory would declare them to be, and require, therefore, some different philosophy from yours for their adequate explanation."

The objection thus raised is one which I have no wish to underrate, but I believe it can be fully answered without departing from the methods and the outlook which have led to the mathematical theory of motion. Let us, however, first try to state the objection more fully.

If the mathematical theory is adequate, nothing happens when a body moves except that it is in different places at different times. But in this sense the hour-hand and the second-hand are equally in motion, yet in the second-hand there is something perceptible to our senses which is absent in the hour-hand. We can see, at each moment, that the second-hand _is moving_, which is different from seeing it first in one place and then in another. This seems to involve our seeing it simultaneously in a number of places, although it must also involve our seeing that it is in some of these places earlier than in others. If, for example, I move my hand quickly from left to right, you seem to see the whole movement at once, in spite of the fact that you know it begins at the left and ends at the right. It is this kind of consideration, I think, which leads Bergson and many others to regard a movement as really one indivisible whole, not the series of separate states imagined by the mathematician.

To this objection there are three supplementary answers, physiological, psychological, and logical. We will consider them successively.

(1) The physiological answer merely shows that, if the physical world is what the mathematician supposes, its sensible appearance may nevertheless be expected to be what it is. The aim of this answer is thus the modest one of showing that the mathematical account is not impossible as applied to the physical world; it does not even attempt to show that this account is necessary, or that an analogous account applies in psychology.

When any nerve is stimulated, so as to cause a sensation, the sensation does not cease instantaneously with the cessation of the stimulus, but dies away in a short finite time. A flash of lightning, brief as it is to our sight, is briefer still as a physical phenomenon: we continue to see it for a few moments after the light-waves have ceased to strike the eye. Thus in the case of a physical motion, if it is sufficiently swift, we shall actually at one instant see the moving body throughout a finite portion of its course, and not only at the exact spot where it is at that instant. Sensations, however, as they die away, grow gradually fainter; thus the sensation due to a stimulus which is recently past is not exactly like the sensation due to a present stimulus. It follows from this that, when we see a rapid motion, we shall not only see a number of positions of the moving body simultaneously, but we shall see them with different degrees of intensity--the present position most vividly, and the others with diminishing vividness, until sensation fades away into immediate memory. This state of things accounts fully for the perception of motion. A motion is _perceived_, not merely _inferred_, when it is sufficiently swift for many positions to be sensible at one time; and the earlier and later parts of one perceived motion are distinguished by the less and greater vividness of the sensations.

This answer shows that physiology can account for our perception of motion. But physiology, in speaking of stimulus and sense-organs and a physical motion distinct from the immediate object of sense, is assuming the truth of physics, and is thus only capable of showing the physical account to be possible, not of showing it to be _necessary_. This consideration brings us to the psychological answer.

(2) The psychological answer to our difficulty about motion is part of a vast theory, not yet worked out, and only capable, at present, of being vaguely outlined. We considered this theory in the third and fourth lectures; for the present, a mere sketch of its application to our present problem must suffice. The world of physics, which was assumed in the physiological answer, is obviously inferred from what is given in sensation; yet as soon as we seriously consider what is actually given in sensation, we find it apparently very different from the world of physics. The question is thus forced upon us: Is the inference from sense to physics a valid one? I believe the answer to be affirmative, for reasons which I suggested in the third and fourth lectures; but the answer cannot be either short or easy. It consists, broadly speaking, in showing that, although the particles, points, and instants with which physics operates are not themselves given in experience, and are very likely not actually existing things, yet, out of the materials provided in sensation, it is possible to make logical constructions having the mathematical properties which physics assigns to particles, points, and instants. If this can be done, then all the propositions of physics can be translated, by a sort of dictionary, into propositions about the kinds of objects which are given in sensation.

Applying these general considerations to the case of motion, we find that, even within the sphere of immediate sense-data, it is necessary, or at any rate more consonant with the facts than any other equally simple view, to distinguish instantaneous states of objects, and to regard such states as forming a compact series. Let us consider a body which is moving swiftly enough for its motion to be perceptible, and long enough for its motion to be not wholly comprised in one sensation. Then, in spite of the fact that we see a finite extent of the motion at one instant, the extent which we see at one instant is different from that which we see at another. Thus we are brought back, after all, to a series of momentary views of the moving body, and this series will be compact, like the former physical series of points. In fact, though the _terms_ of the series seem different, the mathematical character of the series is unchanged, and the whole mathematical theory of motion will apply to it _verbatim_.

When we are considering the actual data of sensation in this connection, it is important to realise that two sense-data may be, and _must_ sometimes be, really different when we cannot perceive any difference between them. An old but conclusive reason for believing this was emphasised by Poincare.[21] In all cases of sense-data capable of gradual change, we may find one sense-datum indistinguishable from another, and that other indistinguishable from a third, while yet the first and third are quite easily distinguishable. Suppose, for example, a person with his eyes shut is holding a weight in his hand, and someone noiselessly adds a small extra weight. If the extra weight is small enough, no difference will be perceived in the sensation. After a time, another small extra weight may be added, and still no change will be perceived; but if both extra weights had been added at once, it may be that the change would be quite easily perceptible. Or, again, take shades of colour. It would be easy to find three stuffs of such

closely similar shades that no difference could be perceived between the first and second, nor yet between the second and third, while yet the first and third would be distinguishable. In such a case, the second shade cannot be the same as the first, or it would be distinguishable from the third; nor the same as the third, or it would be distinguishable from the first. It must, therefore, though indistinguishable from both, be really intermediate between them.

[21] "Le continu mathematique," _Revue de Metaphysique et de Morale_, vol. i. p. 29.

Such considerations as the above show that, although we cannot distinguish sense-data unless they differ by more than a certain amount, it is perfectly reasonable to suppose that sense-data of a given kind, such as weights or colours, really form a compact series. The objections which may be brought from a psychological point of view against the mathematical theory of motion are not, therefore, objections to this theory properly understood, but only to a quite unnecessary assumption of simplicity in the momentary object of sense. Of the immediate object of sense, in the case of a visible motion, we may say that at each instant it is in all the positions which remain sensible at that instant; but this set of positions changes continuously from moment to moment, and is amenable to exactly the same mathematical treatment as if it were a mere point. When we assert that some mathematical account of phenomena is correct, all that we primarily assert is that _something_ definable in terms of the crude phenomena satisfies our formulae; and in this sense the mathematical theory of motion is applicable to the data of sensation as well as to the supposed particles of abstract physics.

There are a number of distinct questions which are apt to be confused when the mathematical continuum is said to be inadequate to the facts of sense. We may state these, in order of diminishing generality, as follows:--

(a) Are series possessing mathematical continuity logically possible?

(b) Assuming that they are possible logically, are they not impossible as applied to actual sense-data, because, among actual sense-data, there are no such fixed mutually external terms as are to be found, _e.g._, in the series of fractions?

(c) Does not the assumption of points and instants make the whole mathematical account fictitious?

(d) Finally, assuming that all these objections have been answered, is there, in actual empirical fact, any sufficient reason to believe the world of sense continuous?

Let us consider these questions in succession.

(a) The question of the logical possibility of the mathematical continuum turns partly on the elementary misunderstandings we considered at the beginning of the present lecture, partly on the possibility of the mathematical infinite, which will occupy our next two lectures, and partly on the logical form of the answer to the Bergsonian objection which we stated a few minutes ago. I shall say no more on this topic at present, since it is desirable first to complete the psychological answer.

(b) The question whether sense-data are composed of mutually external units is not one which can be decided by empirical evidence. It is often urged that, as a matter of immediate experience, the sensible flux is devoid of divisions, and is falsified by the dissections of the intellect. Now I have no wish to argue that this view is _contrary_ to immediate experience: I wish only to maintain that it is essentially incapable of being _proved_ by immediate experience. As we saw, there must be among sense-data differences so slight as to be imperceptible: the fact that sense-data are immediately given does not mean that their differences also _must_ be immediately given (though they _may_ be). Suppose, for example, a coloured surface on which the colour changes gradually--so gradually that the difference of colour in two very neighbouring portions is imperceptible, while the difference between more widely separated portions is quite noticeable. The effect produced, in such a case, will be precisely that of "interpenetration," of transition which is not a matter of discrete units. And since it tends to be supposed that the colours, being immediate data, must _appear_ different if they _are_ different, it seems easily to follow that "interpenetration" must be the ultimately right account. But this does not follow. It is unconsciously assumed, as a premiss for a _reductio ad absurdum_ of the analytic view, that, if A and B are immediate data, and A differs from B, then the fact that they differ must also be an immediate datum. It is difficult to say how this assumption arose, but I think it is to be connected with the confusion between "acquaintance" and "knowledge about." Acquaintance, which is what we derive from sense, does not, theoretically at least, imply even the smallest "knowledge about," _i.e._ it does not imply knowledge of any proposition concerning the object with which we are acquainted. It is a mistake to speak as if acquaintance had degrees: there is merely acquaintance and non-acquaintance. When we speak of becoming "better acquainted," as for instance with a person, what we must mean is, becoming acquainted with more parts of a certain whole; but the acquaintance with each part is either complete or nonexistent. Thus it is a mistake to say that if we were perfectly acquainted with

an object we should know all about it. "Knowledge about" is knowledge of propositions, which is not involved necessarily in acquaintance with the constituents of the propositions. To know that two shades of colour are different is knowledge about them; hence acquaintance with the two shades does not in any way necessitate the knowledge that they are different.

From what has just been said it follows that the nature of sense-data cannot be validly used to prove that they are not composed of mutually external units. It may be admitted, on the other hand, that nothing in their empirical character specially necessitates the view that they are composed of mutually external units. This view, if it is held, must be held on logical, not on empirical, grounds. I believe that the logical grounds are adequate to the conclusion. They rest, at bottom, upon the impossibility of explaining complexity without assuming constituents. It is undeniable that the visual field, for example, is complex; and so far as I can see, there is always self-contradiction in the theories which, while admitting this complexity, attempt to deny that it results from a combination of mutually external units. But to pursue this topic would lead us too far from our theme, and I shall therefore say no more about it at present.

(c) It is sometimes urged that the mathematical account of motion is rendered fictitious by its assumption of points and instants. Now there are here two different questions to be distinguished. There is the question of absolute or relative space and time, and there is the question whether what occupies space and time must be composed of elements which have no extension or duration. And each of these questions in turn may take two forms, namely: (A) is the hypothesis _consistent_ with the facts and with logic? (B) is it _necessitated_ by the facts or by logic? I wish to answer, in each case, yes to the first form of the question, and no to the second. But in any case the mathematical account of motion will not be fictitious, provided a right interpretation is given to the words "point" and "instant." A few words on each alternative will serve to make this clear.

Formally, mathematics adopts an absolute theory of space and time, _i.e._ it assumes that, besides the things which are in space and time, there are also entities, called "points" and "instants," which are occupied by things. This view, however, though advocated by Newton, has long been regarded by mathematicians as merely a convenient fiction. There is, so far as I can see, no conceivable evidence either for or against it. It is logically possible, and it is consistent with the facts. But the facts are also consistent with the denial of spatial and temporal entities over and above things with spatial and temporal relations. Hence, in accordance with Occam's razor, we shall do well to abstain from either assuming or denying points and instants. This means, so far as practical working out is concerned, that we adopt the relational theory; for in practice the refusal to assume points and instants has the same effect as the denial of them. But in strict theory the two are quite different, since the denial introduces an element of unverifiable dogma which is wholly absent when we merely refrain from the assertion. Thus, although we shall derive points and instants from things, we shall leave the bare possibility open that they may also have an independent existence as simple entities.

We come now to the question whether the things in space and time are to be conceived as composed of elements without extension or duration, _i.e._ of elements which only occupy a point and an instant. Physics, formally, assumes in its differential equations that things consist of elements which occupy only a point at each instant, but persist throughout time. For reasons explained in Lecture IV., the persistence of things through time is to be regarded as the formal result of a logical construction, not as necessarily implying any actual persistence. The same motives, in fact, which lead to the division of things into point-particles, ought presumably to lead to their division into instant-particles, so that the ultimate _formal_ constituent of the matter in physics will be a point-instant-particle. But such objects, as well as the particles of physics, are not data. The same economy of hypothesis, which dictates the practical adoption of a relative rather than an absolute space and time, also dictates the practical adoption of material elements which have a finite extension and duration. Since, as we saw in Lecture IV., points and instants can be constructed as logical functions of such elements, the mathematical account of motion, in which a particle passes continuously through a continuous series of points, can be interpreted in a form which assumes only elements which agree with our actual data in having a finite extension and duration. Thus, so far as the use of points and instants is concerned, the mathematical account of motion can be freed from the charge of employing fictions.

(d) But we must now face the question: Is there, in actual empirical fact, any sufficient reason to believe the world of sense continuous? The answer here must, I think, be in the negative. We may say that the hypothesis of continuity is perfectly consistent with the facts and with logic, and that it is technically simpler than any other tenable hypothesis. But since our powers of discrimination among very similar sensible objects are not infinitely precise, it is quite impossible to decide between different theories which only differ in regard to what is below the margin of discrimination. If, for example, a coloured surface which we see consists of a finite number of very small surfaces, and if a motion which we see consists, like a cinematograph, of a large finite number of successive positions, there will be nothing empirically discoverable to show that objects of sense are not continuous. In what is called _experienced_ continuity, such as is said to be given in sense, there is a large negative element: absence of

perception of difference occurs in cases which are _thought_ to give perception of absence of difference. When, for example, we cannot distinguish a colour A from a colour B, nor a colour B from a colour C, but can distinguish A from C, the indistinguishability is a purely negative fact, namely, that we do not _perceive_ a difference. Even in regard to immediate data, this is no reason for denying that there is a difference. Thus, if we see a coloured surface whose colour changes gradually, its sensible appearance if the change is continuous will be indistinguishable from what it would be if the change were by small finite jumps. If this is true, as it seems to be, it follows that there can never be any empirical evidence to demonstrate that the sensible world is continuous, and not a collection of a very large finite number of elements of which each differs from its neighbour in a finite though very small degree. The continuity of space and time, the infinite number of different shades in the spectrum, and so on, are all in the nature of unverifiable hypotheses--perfectly possible logically, perfectly consistent with the known facts, and simpler technically than any other tenable hypotheses, but not the sole hypotheses which are logically and empirically adequate.

If a relational theory of instants is constructed, in which an "instant" is defined as a group of events simultaneous with each other and not all simultaneous with any event outside the group, then if our resulting series of instants is to be compact, it must be possible, if _x_ wholly precedes _y_, to find an event _z_, simultaneous with part of _x_, which wholly precedes some event which wholly precedes _y_. Now this requires that the number of events concerned should be infinite in any finite period of time. If this is to be the case in the world of one man's sense-data, and if each sense-datum is to have not less than a certain finite temporal extension, it will be necessary to assume that we always have an infinite number of sense-data simultaneous with any given sense-datum. Applying similar considerations to space, and assuming that sense-data are to have not less than a certain spatial extension, it will be necessary to suppose that an infinite number of sense-data overlap spatially with any given sense-datum. This hypothesis is possible, if we suppose a single sense-datum, _e.g._ in sight, to be a finite surface, enclosing other surfaces which are also single sense-data. But there are difficulties in such a hypothesis, and I do not know whether these difficulties could be successfully met. If they cannot, we must do one of two things: either declare that the world of one man's sense-data is not continuous, or else refuse to admit that there is any lower limit to the duration and extension of a single sense-datum. I do not know what is the right course to adopt as regards these alternatives. The logical analysis we have been considering provides the apparatus for dealing with the various hypotheses, and the empirical decision between them is a problem for the psychologist.

(3) We have now to consider the _logical_ answer to the alleged difficulties of the mathematical theory of motion, or rather to the positive theory which is urged on the other side. The view urged explicitly by Bergson, and implied in the doctrines of many philosophers, is, that a motion is something indivisible, not validly analysable into a series of states. This is part of a much more general doctrine, which holds that analysis always falsifies, because the parts of a complex whole are different, as combined in that whole, from what they would otherwise be. It is very difficult to state this doctrine in any form which has a precise meaning. Often arguments are used which have no bearing whatever upon the question. It is urged, for example, that when a man becomes a father, his nature is altered by the new relation in which he finds himself, so that he is not strictly identical with the man who was previously not a father. This may be true, but it is a causal psychological fact, not a logical fact. The doctrine would require that a man who is a father cannot be strictly identical with a man who is a son, because he is modified in one way by the relation of fatherhood and in another by that of sonship. In fact, we may give a precise statement of the doctrine we are combating in the form: _There can never be two facts concerning the same thing._ A fact concerning a thing always is or involves a relation to one or more entities; thus two facts concerning the same thing would involve two relations of the same thing. But the doctrine in question holds that a thing is so modified by its relations that it cannot be the same in one relation as in another. Hence, if this doctrine is true, there can never be more than one fact concerning any one thing. I do not think the philosophers in question have realised that this is the precise statement of the view they advocate, because in this form the view is so contrary to plain truth that its falsehood is evident as soon as it is stated. The discussion of this question, however, involves so many logical subtleties, and is so beset with difficulties, that I shall not pursue it further at present.

When once the above general doctrine is rejected, it is obvious that, where there is change, there must be a succession of states. There cannot be change--and motion is only a particular case of change--unless there is something different at one time from what there is at some other time. Change, therefore, must involve relations and complexity, and must demand analysis. So long as our analysis has only gone as far as other smaller changes, it is not complete; if it is to be complete, it must end with terms that are not changes, but are related by a relation of earlier and later. In the case of changes which appear continuous, such as motions, it seems to be impossible to find anything other than change so long as we deal with finite periods of time, however short. We are thus driven back, by the logical necessities of the case, to the conception of instants without duration, or at any rate without any duration which even the most delicate instruments can reveal. This conception, though it can be made to seem difficult, is really easier than any other that the facts allow. It is a kind of logical framework into which any tenable theory must fit--not necessarily

itself the statement of the crude facts, but a form in which statements which are true of the crude facts can be made by a suitable interpretation. The direct consideration of the crude facts of the physical world has been undertaken in earlier lectures; in the present lecture, we have only been concerned to show that nothing in the crude facts is inconsistent with the mathematical doctrine of continuity, or demands a continuity of a radically different kind from that of mathematical motion.

LECTURE VI

THE PROBLEM OF INFINITY CONSIDERED HISTORICALLY

It will be remembered that, when we enumerated the grounds upon which the reality of the sensible world has been questioned, one of those mentioned was the supposed impossibility of infinity and continuity. In view of our earlier discussion of physics, it would seem that no _conclusive_ empirical evidence exists in favour of infinity or continuity in objects of sense or in matter. Nevertheless, the explanation which assumes infinity and continuity remains incomparably easier and more natural, from a scientific point of view, than any other, and since Georg Cantor has shown that the supposed contradictions are illusory, there is no longer any reason to struggle after a finitist explanation of the world.

The supposed difficulties of continuity all have their source in the fact that a continuous series must have an infinite number of terms, and are in fact difficulties concerning infinity. Hence, in freeing the infinite from contradiction, we are at the same time showing the logical possibility of continuity as assumed in science.

The kind of way in which infinity has been used to discredit the world of sense may be illustrated by Kant's first two antinomies. In the first, the thesis states: "The world has a beginning in time, and as regards space is enclosed within limits"; the antithesis states: "The world has no beginning and no limits in space, but is infinite in respect of both time and space." Kant professes to prove both these propositions, whereas, if what we have said on modern logic has any truth, it must be impossible to prove either. In order, however, to rescue the world of sense, it is enough to destroy the proof of _one_ of the two. For our present purpose, it is the proof that the world is _finite_ that interests us. Kant's argument as regards space here rests upon his argument as regards time. We need therefore only examine the argument as regards time. What he says is as follows:

"For let us assume that the world has no beginning as regards time, so that up to every given instant an eternity has elapsed, and therefore an infinite series of successive states of the things in the world has passed by. But the infinity of a series consists just in this, that it can never be completed by successive synthesis. Therefore an infinite past world-series is impossible, and accordingly a beginning of the world is a necessary condition of its existence; which was the first thing to be proved."

Many different criticisms might be passed on this argument, but we will content ourselves with a bare minimum. To begin with, it is a mistake to define the infinity of a series as "impossibility of completion by successive synthesis." The notion of infinity, as we shall see in the next lecture, is primarily a property of _classes_, and only derivatively applicable to series; classes which are infinite are given all at once by the defining property of their members, so that there is no question of "completion" or of "successive synthesis." And the word "synthesis," by suggesting the mental activity of synthesising, introduces, more or less surreptitiously, that reference to mind by which all Kant's philosophy was infected. In the second place, when Kant says that an infinite series can "never" be completed by successive synthesis, all that he has even conceivably a right to say is that it cannot be completed _in a finite time_. Thus what he really proves is, at most, that if the world had no beginning, it must have already existed for an infinite time. This, however, is a very poor conclusion, by no means suitable for his purposes. And with this result we might, if we chose, take leave of the first antinomy.

It is worth while, however, to consider how Kant came to make such an elementary blunder. What happened in his imagination was obviously something like this: Starting from the present and going backwards in time, we have, if the world had no beginning, an infinite series of events. As we see from the word "synthesis," he imagined a mind trying to grasp these successively, _in the reverse order_ to that in which they had occurred, _i.e._ going from the present backwards. _This_ series is obviously one which has no end. But the series of events up to the present has an end, since it ends with the present. Owing to the inveterate subjectivism of his mental habits, he failed to notice that he had reversed the sense of the series by substituting backward synthesis for forward happening, and thus he supposed that it was necessary to identify the mental series, which had no end, with the physical series, which had an end but no beginning. It was this mistake, I think, which, operating unconsciously, led him to attribute validity to a singularly flimsy piece of fallacious reasoning.

The second antinomy illustrates the dependence of the problem of continuity upon that of infinity. The thesis states: "Every complex substance in the world consists of simple parts, and there exists everywhere nothing but the simple or what is composed of it." The antithesis states: "No complex thing in the world consists of simple parts, and everywhere in it there exists nothing simple." Here, as before, the proofs of both thesis and antithesis are open to criticism, but for the purpose of vindicating physics and the world of sense it is enough to find a fallacy in _one_ of the proofs. We will choose for this purpose the proof of the antithesis, which begins as follows:

"Assume that a complex thing (as substance) consists of simple parts. Since all external relation, and therefore all composition out of substances, is only possible in space, the space occupied by a complex thing must consist of as many parts as the thing consists of. Now space does not consist of simple parts, but of spaces."

The rest of his argument need not concern us, for the nerve of the proof lies in the one statement: "Space does not consist of simple parts, but of spaces." This is like Bergson's objection to "the absurd proposition that motion is made up of immobilities." Kant does not tell us why he holds that a space must consist of spaces rather than of simple parts. Geometry regards space as made up of points, which are simple; and although, as we have seen, this view is not scientifically or logically _necessary_, it remains _prima facie_ possible, and its mere possibility is enough to vitiate Kant's argument. For, if his proof of the thesis of the antinomy were valid, and if the antithesis could only be avoided by assuming points, then the antinomy itself would afford a conclusive reason in favour of points. Why, then, did Kant think it impossible that space should be composed of points?

I think two considerations probably influenced him. In the first place, the essential thing about space is spatial order, and mere points, by themselves, will not account for spatial order. It is obvious that his argument assumes absolute space; but it is spatial _relations_ that are alone important, and they cannot be reduced to points. This ground for his view depends, therefore, upon his ignorance of the logical theory of order and his oscillations between absolute and relative space. But there is also another ground for his opinion, which is more relevant to our present topic. This is the ground derived from infinite divisibility. A space may be halved, and then halved again, and so on _ad infinitum_, and at every stage of the process the parts are still spaces, not points. In order to reach points by such a method, it would be necessary to come to the end of an unending process, which is impossible. But just as an infinite class can be given all at once by its defining concept, though it cannot be reached by successive enumeration, so an infinite set of points can be given all at once as making up a line or area or volume, though they can never be reached by the process of successive division. Thus the infinite divisibility of space gives no ground for denying that space is composed of points. Kant does not give his grounds for this denial, and we can therefore only conjecture what they were. But the above two grounds, which we have seen to be fallacious, seem sufficient to account for his opinion, and we may therefore conclude that the antithesis of the second antinomy is unproved.

The above illustration of Kant's antinomies has only been introduced in order to show the relevance of the problem of infinity to the problem of the reality of objects of sense. In the remainder of the present lecture, I wish to state and explain the problem of infinity, to show how it arose, and to show the irrelevance of all the solutions proposed by philosophers. In the following lecture, I shall try to explain the true solution, which has been discovered by the mathematicians, but nevertheless belongs essentially to philosophy. The solution is definitive, in the sense that it entirely satisfies and convinces all who study it carefully. For over two thousand years the human intellect was baffled by the problem; its many failures and its ultimate success make this problem peculiarly apt for the illustration of method.

The problem appears to have first arisen in some such way as the following.[22] Pythagoras and his followers, who were interested, like Descartes, in the application of number to geometry, adopted in that science more arithmetical methods than those with which Euclid has made us familiar. They, or their contemporaries the atomists, believed, apparently, that space is composed of indivisible points, while time is composed of indivisible instants.[23] This belief would not, by itself, have raised the difficulties which they encountered, but it was presumably accompanied by another belief, that the number of points in any finite area or of instants in any finite period must be finite. I do not suppose that this latter belief was a conscious one, because probably no other possibility had occurred to them. But the belief nevertheless operated, and very soon brought them into conflict with facts which they themselves discovered. Before explaining how this occurred, however, it is necessary to say one word in explanation of the phrase "finite number." The _exact_ explanation is a matter for our next lecture; for the present, it must suffice to say that I mean 0 and 1 and 2 and 3 and so on, for ever--in other words, any number that can be obtained by successively adding ones. This includes all the numbers that can be expressed by means of our ordinary numerals, and since such numbers can be made greater and greater, without ever reaching an unsurpassable maximum, it is easy to suppose that there are no other numbers. But this supposition, natural as it is, is mistaken.

[22] In what concerns the early Greek philosophers, my knowledge is largely derived from Burnet's valuable work, _Early Greek Philosophy_ (2nd ed., London, 1908). I have also been greatly assisted by Mr D. S. Robertson of Trinity College, who has supplied the deficiencies of my knowledge of Greek, and brought important references to my notice.

[23] _Cf._ Aristotle, _Metaphysics_, M. 6, 1080b, 18 _sqq._, and 1083b, 8 _sqq._

Whether the Pythagoreans themselves believed space and time to be composed of indivisible points and instants is a debatable question.[24] It would seem that the distinction between space and matter had not yet been clearly made, and that therefore, when an atomistic view is expressed, it is difficult to decide whether particles of matter or points of space are intended. There is an interesting passage[25] in Aristotle's _Physics_,[26] where he says:

"The Pythagoreans all maintained the existence of the void, and said that it enters into the heaven itself from the boundless breath, inasmuch as the heaven breathes in the void also; and the void differentiates natures, as if it were a sort of separation of consecutives, and as if it were their differentiation; and that this also is what is first in numbers, for it is the void which differentiates them."

[24] There is some reason to think that the Pythagoreans distinguished between discrete and continuous quantity. G. J. Allman, in his _Greek Geometry from Thales to Euclid_, says (p. 23): "The Pythagoreans made a fourfold division of mathematical science, attributing one of its parts to the how many, ~to poson~, and the other to the how much, ~to pelikon~; and they assigned to each of these parts a twofold division. For they said that discrete quantity, or the _how many_, either subsists by itself or must be considered with relation to some other; but that continued quantity, or the _how much_, is either stable or in motion. Hence they affirmed that arithmetic contemplates that discrete quantity which subsists by itself, but music that which is related to another; and that geometry considers continued quantity so far as it is immovable; but astronomy (~ten sphairiken~) contemplates continued quantity so far as it is of a self-motive nature. (Proclus, ed. Friedlein, p. 35. As to the distinction between ~to pelikon~, continuous, and ~to poson~, discrete quantity, see Iambl., _in Nicomachi Geraseni Arithmeticam introductionem_, ed. Tennulius, p. 148.)" _Cf._ p. 48.

[25] Referred to by Burnet, _op. cit._, p. 120.

[26] iv., 6. 213b, 22; H. Ritter and L. Preller, _Historia Philosophiae Graecae_, 8th ed., Gotha, 1898, p. 75 (this work will be referred to in future as "R. P.").

This seems to imply that they regarded matter as consisting of atoms with empty space in between. But if so, they must have thought space could be studied by only paying attention to the atoms, for otherwise it would be hard to account for their arithmetical methods in geometry, or for their statement that "things are numbers."

The difficulty which beset the Pythagoreans in their attempts to apply numbers arose through their discovery of incommensurables, and this, in turn, arose as follows. Pythagoras, as we all learnt in youth, discovered the proposition that the sum of the squares on the sides of a right-angled triangle is equal to the square on the hypotenuse. It is said that he sacrificed an ox when he discovered this theorem; if so, the ox was the first martyr to science. But the theorem, though it has remained his chief claim to immortality, was soon found to have a consequence fatal to his whole philosophy. Consider the case of a right-angled triangle whose two sides are equal, such a triangle as is formed by two sides of a square and a diagonal. Here, in virtue of the theorem, the square on the diagonal is double of the square on either of the sides. But Pythagoras or his early followers easily proved that the square of one whole number cannot be double of the square of another.[27] Thus the length of the side and the length of the diagonal are incommensurable; that is to say, however small a unit of length you take, if it is contained an exact number of times in the side, it is not contained any exact number of times in the diagonal, and _vice versa_.

[27] The Pythagorean proof is roughly as follows. If possible, let the ratio of the diagonal to the side of a square be _m_/_n_, where _m_ and _n_ are whole numbers having no common factor. Then we must have _m_2 = 2_n_2. Now the square of an odd number is odd, but _m_2, being equal to 2_n_2, is even. Hence _m_ must be even. But the square of an even number divides by 4, therefore _n_2, which is half of _m_2, must be even. Therefore _n_ must be even. But, since _m_ is even, and _m_ and _n_ have no common factor, _n_ must be odd. Thus _n_ must be both odd and even, which is impossible; and therefore the diagonal and the side cannot have a rational ratio.

Now this fact might have been assimilated by some philosophies without any great difficulty, but to the philosophy of Pythagoras it was absolutely fatal. Pythagoras held that number is the constitutive essence of all things, yet no two numbers could express the

ratio of the side of a square to the diagonal. It would seem probable that we may expand his difficulty, without departing from his thought, by assuming that he regarded the length of a line as determined by the number of atoms contained in it--a line two inches long would contain twice as many atoms as a line one inch long, and so on. But if this were the truth, then there must be a definite numerical ratio between any two finite lengths, because it was supposed that the number of atoms in each, however large, must be finite. Here there was an insoluble contradiction. The Pythagoreans, it is said, resolved to keep the existence of incommensurables a profound secret, revealed only to a few of the supreme heads of the sect; and one of their number, Hippasos of Metapontion, is even said to have been shipwrecked at sea for impiously disclosing the terrible discovery to their enemies. It must be remembered that Pythagoras was the founder of a new religion as well as the teacher of a new science: if the science came to be doubted, the disciples might fall into sin, and perhaps even eat beans, which according to Pythagoras is as bad as eating parents' bones.

The problem first raised by the discovery of incommensurables proved, as time went on, to be one of the most severe and at the same time most far-reaching problems that have confronted the human intellect in its endeavour to understand the world. It showed at once that numerical measurement of lengths, if it was to be made accurate, must require an arithmetic more advanced and more difficult than any that the ancients possessed. They therefore set to work to reconstruct geometry on a basis which did not assume the universal possibility of numerical measurement--a reconstruction which, as may be seen in Euclid, they effected with extraordinary skill and with great logical acumen. The moderns, under the influence of Cartesian geometry, have reasserted the universal possibility of numerical measurement, extending arithmetic, partly for that purpose, so as to include what are called "irrational" numbers, which give the ratios of incommensurable lengths. But although irrational numbers have long been used without a qualm, it is only in quite recent years that logically satisfactory definitions of them have been given. With these definitions, the first and most obvious form of the difficulty which confronted the Pythagoreans has been solved; but other forms of the difficulty remain to be considered, and it is these that introduce us to the problem of infinity in its pure form.

We saw that, accepting the view that a length is composed of points, the existence of incommensurables proves that every finite length must contain an infinite number of points. In other words, if we were to take away points one by one, we should never have taken away all the points, however long we continued the process. The number of points, therefore, cannot be _counted_, for counting is a process which enumerates things one by one. The property of being unable to be counted is characteristic of infinite collections, and is a source of many of their paradoxical qualities. So paradoxical are these qualities that until our own day they were thought to constitute logical contradictions. A long line of philosophers, from Zeno[28] to M. Bergson, have based much of their metaphysics upon the supposed impossibility of infinite collections. Broadly speaking, the difficulties were stated by Zeno, and nothing material was added until we reach Bolzano's _Paradoxien des Unendlichen_, a little work written in 1847-8, and published posthumously in 1851. Intervening attempts to deal with the problem are futile and negligible. The definitive solution of the difficulties is due, not to Bolzano, but to Georg Cantor, whose work on this subject first appeared in 1882.

[28] In regard to Zeno and the Pythagoreans, I have derived much valuable information and criticism from Mr P. E. B. Jourdain.

In order to understand Zeno, and to realise how little modern orthodox metaphysics has added to the achievements of the Greeks, we must consider for a moment his master Parmenides, in whose interest the paradoxes were invented.[29] Parmenides expounded his views in a poem divided into two parts, called "the way of truth" and "the way of opinion"--like Mr Bradley's "Appearance" and "Reality," except that Parmenides tells us first about reality and then about appearance. "The way of opinion," in his philosophy, is, broadly speaking, Pythagoreanism; it begins with a warning: "Here I shall close my trustworthy speech and thought about the truth. Henceforward learn the opinions of mortals, giving ear to the deceptive ordering of my words." What has gone before has been revealed by a goddess, who tells him what really _is_. Reality, she says, is uncreated, indestructible, unchanging, indivisible; it is "immovable in the bonds of mighty chains, without beginning and without end; since coming into being and passing away have been driven afar, and true belief has cast them away." The fundamental principle of his inquiry is stated in a sentence which would not be out of place in Hegel:[30] "Thou canst not know what is not--that is impossible--nor utter it; for it is the same thing that can be thought and that can be." And again: "It needs must be that what can be thought and spoken of is; for it is possible for it to be, and it is not possible for what is nothing to be." The impossibility of change follows from this principle; for what is past can be spoken of, and therefore, by the principle, still is.

[29] So Plato makes Zeno say in the _Parmenides_, apropos of his philosophy as a whole; and all internal and external evidence supports this view.

[30] "With Parmenides," Hegel says, "philosophising proper began." _Werke_ (edition of 1840), vol. xiii. p. 274.

The great conception of a reality behind the passing illusions of sense, a reality one, indivisible, and unchanging, was thus introduced into Western philosophy by Parmenides, not, it would seem, for mystical or religious reasons, but on the basis of a logical argument as to the impossibility of not-being. All the great metaphysical systems--notably those of Plato, Spinoza, and Hegel--are the outcome of this fundamental idea. It is difficult to disentangle the truth and the error in this view. The contention that time is unreal and that the world of sense is illusory must, I think, be regarded as based upon fallacious reasoning. Nevertheless, there is some sense--easier to feel than to state--in which time is an unimportant and superficial characteristic of reality. Past and future must be acknowledged to be as real as the present, and a certain emancipation from slavery to time is essential to philosophic thought. The importance of time is rather practical than theoretical, rather in relation to our desires than in relation to truth. A truer image of the world, I think, is obtained by picturing things as entering into the stream of time from an eternal world outside, than from a view which regards time as the devouring tyrant of all that is. Both in thought and in feeling, to realise the unimportance of time is the gate of wisdom. But unimportance is not unreality; and therefore what we shall have to say about Zeno's arguments in support of Parmenides must be mainly critical.

The relation of Zeno to Parmenides is explained by Plato[31] in the dialogue in which Socrates, as a young man, learns logical acumen and philosophic disinterestedness from their dialectic. I quote from Jowett's translation:

"I see, Parmenides, said Socrates, that Zeno is your second self in his writings too; he puts what you say in another way, and would fain deceive us into believing that he is telling us what is new. For you, in your poems, say All is one, and of this you adduce excellent proofs; and he on the other hand says There is no Many; and on behalf of this he offers overwhelming evidence. To deceive the world, as you have done, by saying the same thing in different ways, one of you affirming the one, and the other denying the many, is a strain of art beyond the reach of most of us.

"Yes, Socrates, said Zeno. But although you are as keen as a Spartan hound in pursuing the track, you do not quite apprehend the true motive of the composition, which is not really such an ambitious work as you imagine; for what you speak of was an accident; I had no serious intention of deceiving the world. The truth is, that these writings of mine were meant to protect the arguments of Parmenides against those who scoff at him and show the many ridiculous and contradictory results which they suppose to follow from the affirmation of the one. My answer is an address to the partisans of the many, whose attack I return with interest by retorting upon them that their hypothesis of the being of the many if carried out appears in a still more ridiculous light than the hypothesis of the being of the one."

[31] _Parmenides_, 128 A-D.

Zeno's four arguments against motion were intended to exhibit the contradictions that result from supposing that there is such a thing as change, and thus to support the Parmenidean doctrine that reality is unchanging.[32] Unfortunately, we only know his arguments through Aristotle,[33] who stated them in order to refute them. Those philosophers in the present day who have had their doctrines stated by opponents will realise that a just or adequate presentation of Zeno's position is hardly to be expected from Aristotle; but by some care in interpretation it seems possible to reconstruct the so-called "sophisms" which have been "refuted" by every tyro from that day to this.

[32] This interpretation is combated by Milhaud, _Les philosophes-geometres de la Grece_, p. 140 n., but his reasons do not seem to me convincing. All the interpretations in what follows are open to question, but all have the support of reputable authorities.

[33] _Physics_, vi. 9. 2396 (R.P. 136-139).

Zeno's arguments would seem to be "ad hominem"; that is to say, they seem to assume premisses granted by his opponents, and to show that, granting these premisses, it is possible to deduce consequences which his opponents must deny. In order to decide whether they are valid arguments or "sophisms," it is necessary to guess at the tacit premisses, and to decide who was the "homo" at whom they were aimed. Some maintain that they were aimed at the Pythagoreans,[34] while others have held that they were intended to refute the atomists.[35] M. Evellin, on the contrary, holds that they constitute a refutation of infinite divisibility,[36] while M. G. Noel, in the interests of Hegel, maintains that the first two arguments refute infinite divisibility, while the next two refute indivisibles.[37] Amid such a bewildering variety of interpretations, we can at least not complain of any restrictions on our liberty of choice.

[34] _Cf._ Gaston Milhaud, _Les philosophes-geometres de la Grece_, p. 140 n.; Paul Tannery, _Pour l'histoire de la science hellene_, p. 249; Burnet, _op. cit._, p. 362.

[35] _Cf._ R. K. Gaye, "On Aristotle, _Physics_, Z ix." _Journal of Philology_, vol. xxxi., esp. p. 111. Also Moritz Cantor, _Vorlesungen ueber Geschichte der Mathematik_, 1st ed., vol. i., 1880, p. 168, who, however, subsequently adopted Paul Tannery's opinion, _Vorlesungen_, 3rd ed. (vol. i. p. 200).

[36] "Le mouvement et les partisans des indivisibles," _Revue de Metaphysique et de Morale_, vol. i. pp. 382-395.

[37] "Le mouvement et les arguments de Zenon d'Elee," _Revue de Metaphysique et de Morale_, vol. i. pp. 107-125.

The historical questions raised by the above-mentioned discussions are no doubt largely insoluble, owing to the very scanty material from which our evidence is derived. The points which seem fairly clear are the following: (1) That, in spite of MM. Milhaud and Paul Tannery, Zeno is anxious to prove that motion is really impossible, and that he desires to prove this because he follows Parmenides in denying plurality;[38] (2) that the third and fourth arguments proceed on the hypothesis of indivisibles, a hypothesis which, whether adopted by the Pythagoreans or not, was certainly much advocated, as may be seen from the treatise _On Indivisible Lines_ attributed to Aristotle. As regards the first two arguments, they would seem to be valid on the hypothesis of indivisibles, and also, without this hypothesis, to be such as would be valid if the traditional contradictions in infinite numbers were insoluble, which they are not.

[38] _Cf._ M. Brochard, "Les pretendus sophismes de Zenon d'Elee," _Revue de Metaphysique et de Morale_, vol. i. pp. 209-215.

We may conclude, therefore, that Zeno's polemic is directed against the view that space and time consist of points and instants; and that as against the view that a finite stretch of space or time consists of a finite number of points and instants, his arguments are not sophisms, but perfectly valid.

The conclusion which Zeno wishes us to draw is that plurality is a delusion, and spaces and times are really indivisible. The other conclusion which is possible, namely, that the number of points and instants is infinite, was not tenable so long as the infinite was infected with contradictions. In a fragment which is not one of the four famous arguments against motion, Zeno says:

"If things are a many, they must be just as many as they are, and neither more nor less. Now, if they are as many as they are, they will be finite in number.

"If things are a many, they will be infinite in number; for there will always be other things between them, and others again between these. And so things are infinite in number."[39]

[39] Simplicius, _Phys._, 140, 28 D (R.P. 133); Burnet, _op. cit._, pp. 364-365.

This argument attempts to prove that, if there are many things, the number of them must be both finite and infinite, which is impossible; hence we are to conclude that there is only one thing. But the weak point in the argument is the phrase: "If they are just as many as they are, they will be finite in number." This phrase is not very clear, but it is plain that it assumes the impossibility of definite infinite numbers. Without this assumption, which is now known to be false, the arguments of Zeno, though they suffice (on certain very reasonable assumptions) to dispel the hypothesis of finite indivisibles, do not suffice to prove that motion and change and plurality are impossible. They are not, however, on any view, mere foolish quibbles: they are serious arguments, raising difficulties which it has taken two thousand years to answer, and which even now are fatal to the teachings of most philosophers.

The first of Zeno's arguments is the argument of the race-course, which is paraphrased by Burnet as follows:[40]

"You cannot get to the end of a race-course. You cannot traverse an infinite number of points in a finite time. You must traverse the half of any given distance before you traverse the whole, and the half of that again before you can traverse it. This goes on _ad infinitum_, so that there are an infinite number of points in any given space, and you cannot touch an infinite number one by one in a finite time."[41]

[40] _Op. cit._, p. 367.

[41] Aristotle's words are: "The first is the one on the non-existence of motion on the ground that what is moved must always attain the middle point sooner than the end-point, on which we gave our opinion in the earlier part of our discourse." _Phys._, vi. 9. 939B (R.P. 136). Aristotle seems to refer to _Phys._, vi. 2. 223AB [R.P. 136A]: "All space is continuous, for time and space are divided into the same and equal divisions.... Wherefore also Zeno's argument is fallacious, that it is impossible to go through an infinite collection or to touch an infinite collection one by one in a finite time. For there are two senses in which the term 'infinite' is applied both to length and to time, and in fact to all continuous things, either in regard to divisibility, or in regard to the ends. Now it is not

possible to touch things infinite in regard to number in a finite time, but it is possible to touch things infinite in regard to divisibility: for time itself also is infinite in this sense. So that in fact we go through an infinite, [space] in an infinite [time] and not in a finite [time], and we touch infinite things with infinite things, not with finite things." Philoponus, a sixth-century commentator (R.P. 136A, _Exc. Paris Philop. in Arist. Phys._, 803, 2. Vit.), gives the following illustration: "For if a thing were moved the space of a cubit in one hour, since in every space there are an infinite number of points, the thing moved must needs touch all the points of the space: it will then go through an infinite collection in a finite time, which is impossible."

Zeno appeals here, in the first place, to the fact that any distance, however small, can be halved. From this it follows, of course, that there must be an infinite number of points in a line. But, Aristotle represents him as arguing, you cannot touch an infinite number of points _one by one_ in a finite time. The words "one by one" are important. (1) If _all_ the points touched are concerned, then, though you pass through them continuously, you do not touch them "one by one." That is to say, after touching one, there is not another which you touch next: no two points are next each other, but between any two there are always an infinite number of others, which cannot be enumerated one by one. (2) If, on the other hand, only the successive middle points are concerned, obtained by always halving what remains of the course, then the points are reached one by one, and, though they are infinite in number, they are in fact all reached in a finite time. His argument to the contrary may be supposed to appeal to the view that a finite time must consist of a finite number of instants, in which case what he says would be perfectly true on the assumption that the possibility of continued dichotomy is undeniable. If, on the other hand, we suppose the argument directed against the partisans of infinite divisibility, we must suppose it to proceed as follows:[42] "The points given by successive halving of the distances still to be traversed are infinite in number, and are reached in succession, each being reached a finite time later than its predecessor; but the sum of an infinite number of finite times must be infinite, and therefore the process will never be completed." It is very possible that this is historically the right interpretation, but in this form the argument is invalid. If half the course takes half a minute, and the next quarter takes a quarter of a minute, and so on, the whole course will take a minute. The apparent force of the argument, on this interpretation, lies solely in the mistaken supposition that there cannot be anything beyond the whole of an infinite series, which can be seen to be false by observing that 1 is beyond the whole of the infinite series 1/2, 3/4, 7/8, 15/16, ...

[42] _Cf._ Mr C. D. Broad, "Note on Achilles and the Tortoise," _Mind_, N.S., vol. xxii. pp. 318-9.

The second of Zeno's arguments is the one concerning Achilles and the tortoise, which has achieved more notoriety than the others. It is paraphrased by Burnet as follows:[43]

"Achilles will never overtake the tortoise. He must first reach the place from which the tortoise started. By that time the tortoise will have got some way ahead. Achilles must then make up that, and again the tortoise will be ahead. He is always coming nearer, but he never makes up to it."[44]

[43] _Op. cit._

[44] Aristotle's words are: "The second is the so-called Achilles. It consists in this, that the slower will never be overtaken in its course by the quickest, for the pursuer must always come first to the point from which the pursued has just departed, so that the slower must necessarily be always still more or less in advance." _Phys._, vi. 9. 239B (R.P. 137).

This argument is essentially the same as the previous one. It shows that, if Achilles ever overtakes the tortoise, it must be after an infinite number of instants have elapsed since he started. This is in fact true; but the view that an infinite number of instants make up an infinitely long time is not true, and therefore the conclusion that Achilles will never overtake the tortoise does not follow.

The third argument,[45] that of the arrow, is very interesting. The text has been questioned. Burnet accepts the alterations of Zeller, and paraphrases thus:

"The arrow in flight is at rest. For, if everything is at rest when it occupies a space equal to itself, and what is in flight at any given moment always occupies a space equal to itself, it cannot move."

[45] _Phys._, vi. 9. 239B (R.P. 138).

But according to Prantl, the literal translation of the unemended text of Aristotle's statement of the argument is as follows: "If everything, when it is behaving in a uniform manner, is continually either moving or at rest, but what is moving is always in the _now_, then the moving arrow is motionless." This form of the argument brings out its force more clearly than Burnet's paraphrase.

Here, if not in the first two arguments, the view that a finite part of time consists of a finite series of successive instants seems to be assumed; at any rate the plausibility of the argument seems to depend upon supposing that there are consecutive instants. Throughout an instant, it is said, a moving body is where it is: it cannot move during the instant, for that would require that the instant should have parts. Thus, suppose we consider a period consisting of a thousand instants, and suppose the arrow is in flight throughout this period. At each of the thousand instants, the arrow is where it is, though at the next instant it is somewhere else. It is never moving, but in some miraculous way the change of position has to occur _between_ the instants, that is to say, not at any time whatever. This is what M. Bergson calls the cinematographic representation of reality. The more the difficulty is meditated, the more real it becomes. The solution lies in the theory of continuous series: we find it hard to avoid supposing that, when the arrow is in flight, there is a _next_ position occupied at the _next_ moment; but in fact there is no next position and no next moment, and when once this is imaginatively realised, the difficulty is seen to disappear.

The fourth and last of Zeno's arguments is[46] the argument of the stadium.

[46] _Phys._, vi. 9. 239B (R.P. 139).

The argument as stated by Burnet is as follows:

First Position. Second Position. A .... A .... B .... B .... C .... C ....

"Half the time may be equal to double the time. Let us suppose three rows of bodies, one of which (A) is at rest while the other two (B, C) are moving with equal velocity in opposite directions. By the time they are all in the same part of the course, B will have passed twice as many of the bodies in C as in A. Therefore the time which it takes to pass C is twice as long as the time it takes to pass A. But the time which B and C take to reach the position of A is the same. Therefore double the time is equal to the half."

Gaye[47] devoted an interesting article to the interpretation of this argument. His translation of Aristotle's statement is as follows:

"The fourth argument is that concerning the two rows of bodies, each row being composed of an equal number of bodies of equal size, passing each other on a race-course as they proceed with equal velocity in opposite directions, the one row originally occupying the space between the goal and the middle point of the course, and the other that between the middle point and the starting-post. This, he thinks, involves the conclusion that half a given time is equal to double the time. The fallacy of the reasoning lies in the assumption that a body occupies an equal time in passing with equal velocity a body that is in motion and a body of equal size that is at rest, an assumption which is false. For instance (so runs the argument), let A A ... be the stationary bodies of equal size, B B ... the bodies, equal in number and in size to A A ..., originally occupying the half of the course from the starting-post to the middle of the A's, and C C ... those originally occupying the other half from the goal to the middle of the A's, equal in number, size, and velocity, to B B ... Then three consequences follow. First, as the B's and C's pass one another, the first B reaches the last C at the same moment at which the first C reaches the last B. Secondly, at this moment the first C has passed all the A's, whereas the first B has passed only half the A's and has consequently occupied only half the time occupied by the first C, since each of the two occupies an equal time in passing each A. Thirdly, at the same moment all the B's have passed all the C's: for the first C and the first B will simultaneously reach the opposite ends of the course, since (so says Zeno) the time occupied by the first C in passing each of the B's is equal to that occupied by it in passing each of the A's, because an equal time is occupied by both the first B and the first C in passing all the A's. This is the argument: but it presupposes the aforesaid fallacious assumption."

[47] _Loc. cit._

First Position. Second Position. B B' B" B B' B" . . . . . .

A A' A" A A' A" . . . . . .

C C' C" C C' C" . . . . . .

This argument is not quite easy to follow, and it is only valid as against the assumption that a finite time consists of a finite number of instants. We may re-state it in different language. Let us suppose three drill-sergeants, A, A', and A", standing in a row, while the two files of soldiers march past them in opposite directions. At the first moment which we consider, the three men B, B', B" in one row, and the three men C, C', C" in the other row, are respectively opposite to A, A', and A". At the very next moment, each row has moved on, and now B and C" are opposite A'. Thus B and C" are opposite each other. When, then, did B pass C'? It must have been somewhere between the two moments which we supposed consecutive, and therefore the two moments cannot really have been consecutive. It follows that there must be other moments between any two given moments, and therefore that there must be

an infinite number of moments in any given interval of time.

The above difficulty, that B must have passed C' at some time between two consecutive moments, is a genuine one, but is not precisely the difficulty raised by Zeno. What Zeno professes to prove is that "half of a given time is equal to double that time." The most intelligible explanation of the argument known to me is that of Gaye.[48] Since, however, his explanation is not easy to set forth shortly, I will re-state what seems to me to be the logical essence of Zeno's contention. If we suppose that time consists of a series of consecutive instants, and that motion consists in passing through a series of consecutive points, then the fastest possible motion is one which, at each instant, is at a point consecutive to that at which it was at the previous instant. Any slower motion must be one which has intervals of rest interspersed, and any faster motion must wholly omit some points. All this is evident from the fact that we cannot have more than one event for each instant. But now, in the case of our A's and B's and C's, B is opposite a fresh A every instant, and therefore the number of A's passed gives the number of instants since the beginning of the motion. But during the motion B has passed twice as many C's, and yet cannot have passed more than one each instant. Hence the number of instants since the motion began is twice the number of A's passed, though we previously found it was equal to this number. From this result, Zeno's conclusion follows.

[48] _Loc. cit._, p. 105.

Zeno's arguments, in some form, have afforded grounds for almost all the theories of space and time and infinity which have been constructed from his day to our own. We have seen that all his arguments are valid (with certain reasonable hypotheses) on the assumption that finite spaces and times consist of a finite number of points and instants, and that the third and fourth almost certainly in fact proceeded on this assumption, while the first and second, which were perhaps intended to refute the opposite assumption, were in that case fallacious. We may therefore escape from his paradoxes either by maintaining that, though space and time do consist of points and instants, the number of them in any finite interval is infinite; or by denying that space and time consist of points and instants at all; or lastly, by denying the reality of space and time altogether. It would seem that Zeno himself, as a supporter of Parmenides, drew the last of these three possible deductions, at any rate in regard to time. In this a very large number of philosophers have followed him. Many others, like M. Bergson, have preferred to deny that space and time consist of points and instants. Either of these solutions will meet the difficulties in the form in which Zeno raised them. But, as we saw, the difficulties can also be met if infinite numbers are admissible. And on grounds which are independent of space and time, infinite numbers, and series in which no two terms are consecutive, must in any case be admitted. Consider, for example, all the fractions less than 1, arranged in order of magnitude. Between any two of them, there are others, for example, the arithmetical mean of the two. Thus no two fractions are consecutive, and the total number of them is infinite. It will be found that much of what Zeno says as regards the series of points on a line can be equally well applied to the series of fractions. And we cannot deny that there are fractions, so that two of the above ways of escape are closed to us. It follows that, if we are to solve the whole class of difficulties derivable from Zeno's by analogy, we must discover some tenable theory of infinite numbers. What, then, are the difficulties which, until the last thirty years, led philosophers to the belief that infinite numbers are impossible?

The difficulties of infinity are of two kinds, of which the first may be called sham, while the others involve, for their solution, a certain amount of new and not altogether easy thinking. The sham difficulties are those suggested by the etymology, and those suggested by confusion of the mathematical infinite with what philosophers impertinently call the "true" infinite. Etymologically, "infinite" should mean "having no end." But in fact some infinite series have ends, some have not; while some collections are infinite without being serial, and can therefore not properly be regarded as either endless or having ends. The series of instants from any earlier one to any later one (both included) is infinite, but has two ends; the series of instants from the beginning of time to the present moment has one end, but is infinite. Kant, in his first antinomy, seems to hold that it is harder for the past to be infinite than for the future to be so, on the ground that the past is now completed, and that nothing infinite can be completed. It is very difficult to see how he can have imagined that there was any sense in this remark; but it seems most probable that he was thinking of the infinite as the "unended." It is odd that he did not see that the future too has one end at the present, and is precisely on a level with the past. His regarding the two as different in this respect illustrates just that kind of slavery to time which, as we agreed in speaking of Parmenides, the true philosopher must learn to leave behind him.

The confusions introduced into the notions of philosophers by the so-called "true" infinite are curious. They see that this notion is not the same as the mathematical infinite, but they choose to believe that it is the notion which the mathematicians are vainly trying to reach. They therefore inform the mathematicians, kindly but firmly, that they are mistaken in adhering to the "false" infinite, since plainly the "true" infinite is something quite different. The reply to this is that what they call the "true" infinite is a notion totally irrelevant to the problem of the mathematical infinite, to which it has only a fanciful and verbal analogy. So remote is it that I do not

propose to confuse the issue by even mentioning what the "true" infinite is. It is the "false" infinite that concerns us, and we have to show that the epithet "false" is undeserved.

There are, however, certain genuine difficulties in understanding the infinite, certain habits of mind derived from the consideration of finite numbers, and easily extended to infinite numbers under the mistaken notion that they represent logical necessities. For example, every number that we are accustomed to, except 0, has another number immediately before it, from which it results by adding 1; but the first infinite number does not have this property. The numbers before it form an infinite series, containing all the ordinary finite numbers, having no maximum, no last finite number, after which one little step would plunge us into the infinite. If it is assumed that the first infinite number is reached by a succession of small steps, it is easy to show that it is self-contradictory. The first infinite number is, in fact, beyond the whole unending series of finite numbers. "But," it will be said, "there cannot be anything beyond the whole of an unending series." This, we may point out, is the very principle upon which Zeno relies in the arguments of the race-course and the Achilles. Take the race-course: there is the moment when the runner still has half his distance to run, then the moment when he still has a quarter, then when he still has an eighth, and so on in a strictly unending series. Beyond the whole of this series is the moment when he reaches the goal. Thus there certainly can be something beyond the whole of an unending series. But it remains to show that this fact is only what might have been expected.

The difficulty, like most of the vaguer difficulties besetting the mathematical infinite, is derived, I think, from the more or less unconscious operation of the idea of _counting_. If you set to work to count the terms in an infinite collection, you will never have completed your task. Thus, in the case of the runner, if half, three-quarters, seven-eighths, and so on of the course were marked, and the runner was not allowed to pass any of the marks until the umpire said "Now," then Zeno's conclusion would be true in practice, and he would never reach the goal.

But it is not essential to the existence of a collection, or even to knowledge and reasoning concerning it, that we should be able to pass its terms in review one by one. This may be seen in the case of finite collections; we can speak of "mankind" or "the human race," though many of the individuals in this collection are not personally known to us. We can do this because we know of various characteristics which every individual has if he belongs to the collection, and not if he does not. And exactly the same happens in the case of infinite collections: they may be known by their characteristics although their terms cannot be enumerated. In this sense, an unending series may nevertheless form a whole, and there may be new terms beyond the whole of it.

Some purely arithmetical peculiarities of infinite numbers have also caused perplexity. For instance, an infinite number is not increased by adding one to it, or by doubling it. Such peculiarities have seemed to many to contradict logic, but in fact they only contradict confirmed mental habits. The whole difficulty of the subject lies in the necessity of thinking in an unfamiliar way, and in realising that many properties which we have thought inherent in number are in fact peculiar to finite numbers. If this is remembered, the positive theory of infinity, which will occupy the next lecture, will not be found so difficult as it is to those who cling obstinately to the prejudices instilled by the arithmetic which is learnt in childhood.

LECTURE VII

THE POSITIVE THEORY OF INFINITY

The positive theory of infinity, and the general theory of number to which it has given rise, are among the triumphs of scientific method in philosophy, and are therefore specially suitable for illustrating the logical-analytic character of that method. The work in this subject has been done by mathematicians, and its results can be expressed in mathematical symbolism. Why, then, it may be said, should the subject be regarded as philosophy rather than as mathematics? This raises a difficult question, partly concerned with the use of words, but partly also of real importance in understanding the function of philosophy. Every subject-matter, it would seem, can give rise to philosophical investigations as well as to the appropriate science, the difference between the two treatments being in the direction of movement and in the kind of truths which it is sought to establish. In the special sciences, when they have become fully developed, the movement is forward and synthetic, from the simpler to the more complex. But in philosophy we follow the inverse direction: from the complex and relatively concrete we proceed towards the simple and abstract by means of analysis, seeking, in the process, to eliminate the particularity of the original subject-matter, and to confine our attention entirely to the logical _form_ of the facts concerned.

Between philosophy and pure mathematics there is a certain affinity, in the fact that both are general and _a priori_. Neither of them asserts propositions which, like those of history and geography, depend upon the actual concrete facts being just what they are.

We may illustrate this characteristic by means of Leibniz's conception of many _possible_ worlds, of which one only is _actual_. In all the many possible worlds, philosophy and mathematics will be the same; the differences will only be in respect of those particular facts which are chronicled by the descriptive sciences. Any quality, therefore, by which our actual world is distinguished from other abstractly possible worlds, must be ignored by mathematics and philosophy alike. Mathematics and philosophy differ, however, in their manner of treating the general properties in which all possible worlds agree; for while mathematics, starting from comparatively simple propositions, seeks to build up more and more complex results by deductive synthesis, philosophy, starting from data which are common knowledge, seeks to purify and generalise them into the simplest statements of abstract form that can be obtained from them by logical analysis.

The difference between philosophy and mathematics may be illustrated by our present problem, namely, the nature of number. Both start from certain facts about numbers which are evident to inspection. But mathematics uses these facts to deduce more and more complicated theorems, while philosophy seeks, by analysis, to go behind these facts to others, simpler, more fundamental, and inherently more fitted to form the premisses of the science of arithmetic. The question, "What is a number?" is the pre-eminent philosophic question in this subject, but it is one which the mathematician as such need not ask, provided he knows enough of the properties of numbers to enable him to deduce his theorems. We, since our object is philosophical, must grapple with the philosopher's question. The answer to the question, "What is a number?" which we shall reach in this lecture, will be found to give also, by implication, the answer to the difficulties of infinity which we considered in the previous lecture.

The question "What is a number?" is one which, until quite recent times, was never considered in the kind of way that is capable of yielding a precise answer. Philosophers were content with some vague dictum such as, "Number is unity in plurality." A typical definition of the kind that contented philosophers is the following from Sigwart's _Logic_ (Sec. 66, section 3): "Every number is not merely a _plurality_, but a plurality thought _as held together and closed, and to that extent as a unity_." Now there is in such definitions a very elementary blunder, of the same kind that would be committed if we said "yellow is a flower" because some flowers are yellow. Take, for example, the number 3. A single collection of three things might conceivably be described as "a plurality thought as held together and closed, and to that extent as a unity"; but a collection of three things is not the number 3. The number 3 is something which all collections of three things have in common, but is not itself a collection of three things. The definition, therefore, apart from any other defects, has failed to reach the necessary degree of abstraction: the number 3 is something more abstract than any collection of three things.

Such vague philosophic definitions, however, remained inoperative because of their very vagueness. What most men who thought about numbers really had in mind was that numbers are the result of _counting_. "On the consciousness of the law of counting," says Sigwart at the beginning of his discussion of number, "rests the possibility of spontaneously prolonging the series of numbers _ad infinitum_." It is this view of number as generated by counting which has been the chief psychological obstacle to the understanding of infinite numbers. Counting, because it is familiar, is erroneously supposed to be simple, whereas it is in fact a highly complex process, which has no meaning unless the numbers reached in counting have some significance independent of the process by which they are reached. And infinite numbers cannot be reached at all in this way. The mistake is of the same kind as if cows were defined as what can be bought from a cattle-merchant. To a person who knew several cattle-merchants, but had never seen a cow, this might seem an admirable definition. But if in his travels he came across a herd of wild cows, he would have to declare that they were not cows at all, because no cattle-merchant could sell them. So infinite numbers were declared not to be numbers at all, because they could not be reached by counting.

It will be worth while to consider for a moment what counting actually is. We count a set of objects when we let our attention pass from one to another, until we have attended once to each, saying the names of the numbers in order with each successive act of attention. The last number named in this process is the number of the objects, and therefore counting is a method of finding out what the number of the objects is. But this operation is really a very complicated one, and those who imagine that it is the logical source of number show themselves remarkably incapable of analysis. In the first place, when we say "one, two, three ..." as we count, we cannot be said to be discovering the number of the objects counted unless we attach some meaning to the words one, two, three, ... A child may learn to know these words in order, and to repeat them correctly like the letters of the alphabet, without attaching any meaning to them. Such a child may count correctly from the point of view of a grown-up listener, without having any idea of numbers at all. The operation of counting, in fact, can only be intelligently performed by a person who already has some idea what the numbers are; and from this it follows that counting does not give the logical basis of number.

Again, how do we know that the last number reached in the process of counting is the number of the objects counted? This is just one of those facts that are too familiar for their significance to be realised; but those who wish to be logicians must acquire the habit

of dwelling upon such facts. There are two propositions involved in this fact: first, that the number of numbers from 1 up to any given number is that given number--for instance, the number of numbers from 1 to 100 is a hundred; secondly, that if a set of numbers can be used as names of a set of objects, each number occurring only once, then the number of numbers used as names is the same as the number of objects. The first of these propositions is capable of an easy arithmetical proof so long as finite numbers are concerned; but with infinite numbers, after the first, it ceases to be true. The second proposition remains true, and is in fact, as we shall see, an immediate consequence of the definition of number. But owing to the falsehood of the first proposition where infinite numbers are concerned, counting, even if it were practically possible, would not be a valid method of discovering the number of terms in an infinite collection, and would in fact give different results according to the manner in which it was carried out.

There are two respects in which the infinite numbers that are known differ from finite numbers: first, infinite numbers have, while finite numbers have not, a property which I shall call _reflexiveness_; secondly, finite numbers have, while infinite numbers have not, a property which I shall call _inductiveness_. Let us consider these two properties successively.

(1) _Reflexiveness._--A number is said to be _reflexive_ when it is not increased by adding 1 to it. It follows at once that any finite number can be added to a reflexive number without increasing it. This property of infinite numbers was always thought, until recently, to be self-contradictory; but through the work of Georg Cantor it has come to be recognised that, though at first astonishing, it is no more self-contradictory than the fact that people at the antipodes do not tumble off. In virtue of this property, given any infinite collection of objects, any finite number of objects can be added or taken away without increasing or diminishing the number of the collection. Even an infinite number of objects may, under certain conditions, be added or taken away without altering the number. This may be made clearer by the help of some examples.

Imagine all the natural numbers 0, 1, 2, 3, ... to be written down in a row, and immediately beneath them write down the numbers 1, 2, 3, 4, ..., so that 1 is under 0, 2 is under 1, and so on. Then every number in the top row has a number directly under it in the bottom row, and no number occurs twice in either row. It follows that the number of numbers in the two rows must be the same. But all the numbers that occur in the bottom row also occur in the top row, and one more, namely 0; thus the number of terms in the top row is obtained by adding one to the number of the bottom row. So long, therefore, as it was supposed that a number must be increased by adding 1 to it, this state of things constituted a contradiction, and led to the denial that there are infinite numbers.

0, 1, 2, 3, ... _n_ ... 1, 2, 3, 4, ... _n_ + 1 ...

The following example is even more surprising. Write the natural numbers 1, 2, 3, 4, ... in the top row, and the even numbers 2, 4, 6, 8, ... in the bottom row, so that under each number in the top row stands its double in the bottom row. Then, as before, the number of numbers in the two rows is the same, yet the second row results from taking away all the odd numbers--an infinite collection--from the top row. This example is given by Leibniz to prove that there can be no infinite numbers. He believed in infinite collections, but, since he thought that a number must always be increased when it is added to and diminished when it is subtracted from, he maintained that infinite collections do not have numbers. "The number of all numbers," he says, "implies a contradiction, which I show thus: To any number there is a corresponding number equal to its double. Therefore the number of all numbers is not greater than the number of even numbers, _i.e._ the whole is not greater than its part."[49] In dealing with this argument, we ought to substitute "the number of all finite numbers" for "the number of all numbers"; we then obtain exactly the illustration given by our two rows, one containing all the finite numbers, the other only the even finite numbers. It will be seen that Leibniz regards it as self-contradictory to maintain that the whole is not greater than its part. But the word "greater" is one which is capable of many meanings; for our purpose, we must substitute the less ambiguous phrase "containing a greater number of terms." In this sense, it is not self-contradictory for whole and part to be equal; it is the realisation of this fact which has made the modern theory of infinity possible.

[49] _Phil. Werke_, Gerhardt's edition, vol. i. p. 338.

There is an interesting discussion of the reflexiveness of infinite wholes in the first of Galileo's Dialogues on Motion. I quote from a translation published in 1730.[50] The personages in the dialogue are Salviati, Sagredo, and Simplicius, and they reason as follows:

"_Simp._ Here already arises a Doubt which I think is not to be resolv'd; and that is this: Since 'tis plain that one Line is given greater than another, and since both contain infinite Points, we must surely necessarily infer, that we have found in the same Species something greater than Infinite, since the Infinity of Points of the greater Line exceeds the Infinity of Points of the lesser. But now, to assign an Infinite greater than an Infinite, is what I can't possibly conceive.

"_Salv._ These are some of those Difficulties which arise from Discourses which our finite Understanding makes about Infinites, by ascribing to them Attributes which we give to Things finite and terminate, which I think most improper, because those Attributes of Majority, Minority, and Equality, agree not with Infinities, of which we can't say that one is greater than, less than, or equal to another. For Proof whereof I have something come into my Head, which (that I may be the better understood) I will propose by way of Interrogatories to _Simplicius_, who started this Difficulty. To begin then: I suppose you know which are square Numbers, and which not?

"_Simp._ I know very well that a square Number is that which arises from the Multiplication of any Number into itself; thus 4 and 9 are square Numbers, that arising from 2, and this from 3, multiplied by themselves.

"_Salv._ Very well; And you also know, that as the Products are call'd Squares, the Factors are call'd Roots: And that the other Numbers, which proceed not from Numbers multiplied into themselves, are not Squares. Whence taking in all Numbers, both Squares and Not Squares, if I should say, that the Not Squares are more than the Squares, should I not be in the right?

"_Simp._ Most certainly.

"_Salv._ If I go on with you then, and ask you, How many squar'd Numbers there are? you may truly answer, That there are as many as are their proper Roots, since every Square has its own Root, and every Root its own Square, and since no Square has more than one Root, nor any Root more than one Square.

"_Simp._ Very true.

"_Salv._ But now, if I should ask how many Roots there are, you can't deny but there are as many as there are Numbers, since there's no Number but what's the Root to some Square. And this being granted, we may likewise affirm, that there are as many square Numbers, as there are Numbers; for there are as many Squares as there are Roots, and as many Roots as Numbers. And yet in the Beginning of this, we said, there were many more Numbers than Squares, the greater Part of Numbers being not Squares: And tho' the Number of Squares decreases in a greater proportion, as we go on to bigger Numbers, for count to an Hundred you'll find 10 Squares, viz. 1, 4, 9, 16, 25, 36, 49, 64, 81, 100, which is the same as to say the 10th Part are Squares; in Ten thousand only the 100th Part are Squares; in a Million only the 1000th: And yet in an infinite Number, if we can but comprehend it, we may say the Squares are as many as all the Numbers taken together.

"_Sagr._ What must be determin'd then in this Case?

"_Salv._ I see no other way, but by saying that all Numbers are infinite; Squares are Infinite, their Roots Infinite, and that the Number of Squares is not less than the Number of Numbers, nor this less than that: and then by concluding that the Attributes or Terms of Equality, Majority, and Minority, have no Place in Infinites, but are confin'd to terminate Quantities."

[50] _Mathematical Discourses concerning two new sciences relating to mechanics and local motion, in four dialogues._ By Galileo Galilei, Chief Philosopher and Mathematician to the Grand Duke of Tuscany. Done into English from the Italian, by Tho. Weston, late Master, and now published by John Weston, present Master, of the Academy at Greenwich. See pp. 46 ff.

The way in which the problem is expounded in the above discussion is worthy of Galileo, but the solution suggested is not the right one. It is actually the case that the number of square (finite) numbers is the same as the number of (finite) numbers. The fact that, so long as we confine ourselves to numbers less than some given finite number, the proportion of squares tends towards zero as the given finite number increases, does not contradict the fact that the number of all finite squares is the same as the number of all finite numbers. This is only an instance of the fact, now familiar to mathematicians, that the _limit_ of a function as the variable _approaches_ a given point may not be the same as its _value_ when the variable actually _reaches_ the given point. But although the infinite numbers which Galileo discusses are equal, Cantor has shown that what Simplicius could not conceive is true, namely, that there are an infinite number of different infinite numbers, and that the conception of _greater_ and _less_ can be perfectly well applied to them. The whole of Simplicius's difficulty comes, as is evident, from his belief that, if _greater_ and _less_ can be applied, a part of an infinite collection must have fewer terms than the whole; and when this is denied, all contradictions disappear. As regards greater and less lengths of lines, which is the problem from which the above discussion starts, that involves a meaning of _greater_ and _less_ which is not arithmetical. The number of points is the same in a long line and in a short one, being in fact the same as the number of points in all space. The _greater_ and _less_ of metrical geometry involves the new metrical conception of _congruence_, which cannot be developed out of arithmetical considerations alone. But this question has not the fundamental importance which belongs to the arithmetical theory of infinity.

(2) _Non-inductiveness._--The second property by which infinite numbers are distinguished from finite numbers is the property of non-inductiveness. This will be best explained by defining the positive property of inductiveness which characterises the finite numbers, and which is named after the method of proof known as "mathematical induction."

Let us first consider what is meant by calling a property "hereditary" in a given series. Take such a property as being named Jones. If a man is named Jones, so is his son; we will therefore call the property of being called Jones hereditary with respect to the relation of father and son. If a man is called Jones, all his descendants in the direct male line are called Jones; this follows from the fact that the property is hereditary. Now, instead of the relation of father and son, consider the relation of a finite number to its immediate successor, that is, the relation which holds between 0 and 1, between 1 and 2, between 2 and 3, and so on. If a property of numbers is hereditary with respect to this relation, then if it belongs to (say) 100, it must belong also to all finite numbers greater than 100; for, being hereditary, it belongs to 101 because it belongs to 100, and it belongs to 102 because it belongs to 101, and so on--where the "and so on" will take us, sooner or later, to any finite number greater than 100. Thus, for example, the property of being greater than 99 is hereditary in the series of finite numbers; and generally, a property is hereditary in this series when, given any number that possesses the property, the next number must always also possess it.

It will be seen that a hereditary property, though it must belong to all the finite numbers greater than a given number possessing the property, need not belong to all the numbers less than this number. For example, the hereditary property of being greater than 99 belongs to 100 and all greater numbers, but not to any smaller number. Similarly, the hereditary property of being called Jones belongs to all the descendants (in the direct male line) of those who have this property, but not to all their ancestors, because we reach at last a first Jones, before whom the ancestors have no surname. It is obvious, however, that any hereditary property possessed by Adam must belong to all men; and similarly any hereditary property possessed by 0 must belong to all finite numbers. This is the principle of what is called "mathematical induction." It frequently happens, when we wish to prove that all finite numbers have some property, that we have first to prove that 0 has the property, and then that the property is hereditary, _i.e._ that, if it belongs to a given number, then it belongs to the next number. Owing to the fact that such proofs are called "inductive," I shall call the properties to which they are applicable "inductive" properties. Thus an inductive property of numbers is one which is hereditary and belongs to 0.

Taking any one of the natural numbers, say 29, it is easy to see that it must have all inductive properties. For since such properties belong to 0 and are hereditary, they belong to 1; therefore, since they are hereditary, they belong to 2, and so on; by twenty-nine repetitions of such arguments we show that they belong to 29. We may _define_ the "inductive" numbers as _all those that possess all inductive properties_; they will be the same as what are called the "natural" numbers, _i.e._ the ordinary finite whole numbers. To all such numbers, proofs by mathematical induction can be validly applied. They are those numbers, we may loosely say, which can be reached from 0 by successive additions of 1; in other words, they are all the numbers that can be reached by counting.

But beyond all these numbers, there are the infinite numbers, and infinite numbers do not have all inductive properties. Such numbers, therefore, may be called non-inductive. All those properties of numbers which are proved by an imaginary step-by-step process from one number to the next are liable to fail when we come to infinite numbers. The first of the infinite numbers has no immediate predecessor, because there is no greatest finite number; thus no succession of steps from one number to the next will ever reach from a finite number to an infinite one, and the step-by-step method of proof fails. This is another reason for the supposed self-contradictions of infinite numbers. Many of the most familiar properties of numbers, which custom had led people to regard as logically necessary, are in fact only demonstrable by the step-by-step method, and fail to be true of infinite numbers. But so soon as we realise the necessity of proving such properties by mathematical induction, and the strictly limited scope of this method of proof, the supposed contradictions are seen to contradict, not logic, but only our prejudices and mental habits.

The property of being increased by the addition of 1--_i.e._ the property of non-reflexiveness--may serve to illustrate the limitations of mathematical induction. It is easy to prove that 0 is increased by the addition of 1, and that, if a given number is increased by the addition of 1, so is the next number, _i.e._ the number obtained by the addition of 1. It follows that each of the natural numbers is increased by the addition of 1. This follows generally from the general argument, and follows for each particular case by a sufficient number of applications of the argument. We first prove that 0 is not equal to 1; then, since the property of being increased by 1 is hereditary, it follows that 1 is not equal to 2; hence it follows that 2 is not equal to 3; if we wish to prove that 30,000 is not equal to 30,001, we can do so by repeating this reasoning 30,000 times. But we cannot prove in this way that _all_ numbers are increased by the addition of 1; we can only prove that this holds of the numbers attainable by successive additions of 1 starting from 0. The reflexive numbers, which lie beyond all those attainable in this way, are as a matter of fact not increased by the addition of 1.

The two properties of reflexiveness and non-inductiveness, which we have considered as characteristics of infinite numbers, have not so far been proved to be always found together. It is known that all reflexive numbers are non-inductive, but it is not known that all non-inductive numbers are reflexive. Fallacious proofs of this proposition have been published by many writers, including myself, but up to the present no valid proof has been discovered. The infinite numbers actually known, however, are all reflexive as well as non-inductive; thus, in mathematical practice, if not in theory, the two properties are always associated. For our purposes, therefore, it will be convenient to ignore the bare possibility that there may be non-inductive non-reflexive numbers, since all known numbers are either inductive or reflexive.

When infinite numbers are first introduced to people, they are apt to refuse the name of numbers to them, because their behaviour is so different from that of finite numbers that it seems a wilful misuse of terms to call them numbers at all. In order to meet this feeling, we must now turn to the logical basis of arithmetic, and consider the logical definition of numbers.

The logical definition of numbers, though it seems an essential support to the theory of infinite numbers, was in fact discovered independently and by a different man. The theory of infinite numbers--that is to say, the arithmetical as opposed to the logical part of the theory--was discovered by Georg Cantor, and published by him in 1882-3.[51] The definition of number was discovered about the same time by a man whose great genius has not received the recognition it deserves--I mean Gottlob Frege of Jena. His first work, _Begriffsschrift_, published in 1879, contained the very important theory of hereditary properties in a series to which I alluded in connection with inductiveness. His definition of number is contained in his second work, published in 1884, and entitled _Die Grundlagen der Arithmetik, eine logisch-mathematische Untersuchung ueber den Begriff der Zahl_.[52] It is with this book that the logical theory of arithmetic begins, and it will repay us to consider Frege's analysis in some detail.

[51] In his _Grundlagen einer allgemeinen Mannichfaltigkeitslehre_ and in articles in _Acta Mathematica_, vol. ii.

[52] The definition of number contained in this book, and elaborated in the _Grundgesetze der Arithmetik_ (vol. i., 1893; vol. ii., 1903), was rediscovered by me in ignorance of Frege's work. I wish to state as emphatically as possible--what seems still often ignored--that his discovery antedated mine by eighteen years.

Frege begins by noting the increased desire for logical strictness in mathematical demonstrations which distinguishes modern mathematicians from their predecessors, and points out that this must lead to a critical investigation of the definition of number. He proceeds to show the inadequacy of previous philosophical theories, especially of the "synthetic _a priori_" theory of Kant and the empirical theory of Mill. This brings him to the question: What kind of object is it that number can properly be ascribed to? He points out that physical things may be regarded as one or many: for example, if a tree has a thousand leaves, they may be taken altogether as constituting its foliage, which would count as one, not as a thousand; and _one_ pair of boots is the same object as _two_ boots. It follows that physical things are not the subjects of which number is properly predicated; for when we have discovered the proper subjects, the number to be ascribed must be unambiguous. This leads to a discussion of the very prevalent view that number is really something psychological and subjective, a view which Frege emphatically rejects. "Number," he says, "is as little an object of psychology or an outcome of psychical processes as the North Sea.... The botanist wishes to state something which is just as much a fact when he gives the number of petals in a flower as when he gives its colour. The one depends as little as the other upon our caprice. There is therefore a certain similarity between number and colour; but this does not consist in the fact that both are sensibly perceptible in external things, but in the fact that both are objective" (p. 34).

"I distinguish the objective," he continues, "from the palpable, the spatial, the actual. The earth's axis, the centre of mass of the solar system, are objective, but I should not call them actual, like the earth itself" (p. 35). He concludes that number is neither spatial and physical, nor subjective, but non-sensible and objective. This conclusion is important, since it applies to all the subject-matter of mathematics and logic. Most philosophers have thought that the physical and the mental between them exhausted the world of being. Some have argued that the objects of mathematics were obviously not subjective, and therefore must be physical and empirical; others have argued that they were obviously not physical, and therefore must be subjective and mental. Both sides were right in what they denied, and wrong in what they asserted; Frege has the merit of accepting both denials, and finding a third assertion by recognising the world of logic, which is neither mental nor physical.

The fact is, as Frege points out, that no number, not even 1, is applicable to physical things, but only to general terms or descriptions, such as "man," "satellite of the earth," "satellite of Venus." The general term "man" is applicable to a certain number of objects: there are in the world so and so many men. The unity which philosophers rightly feel to be necessary for the assertion of a number is the unity of the general term, and it is the general term which is the proper subject of number. And this applies equally

when there is one object or none which falls under the general term. "Satellite of the earth" is a term only applicable to one object, namely, the moon. But "one" is not a property of the moon itself, which may equally well be regarded as many molecules: it is a property of the general term "earth's satellite." Similarly, 0 is a property of the general term "satellite of Venus," because Venus has no satellite. Here at last we have an intelligible theory of the number 0. This was impossible if numbers applied to physical objects, because obviously no physical object could have the number 0. Thus, in seeking our definition of number we have arrived so far at the result that numbers are properties of general terms or general descriptions, not of physical things or of mental occurrences.

Instead of speaking of a general term, such as "man," as the subject of which a number can be asserted, we may, without making any serious change, take the subject as the class or collection of objects--_i.e._ "mankind" in the above instance--to which the general term in question is applicable. Two general terms, such as "man" and "featherless biped," which are applicable to the same collection of objects, will obviously have the same number of instances; thus the number depends upon the class, not upon the selection of this or that general term to describe it, provided several general terms can be found to describe the same class. But some general term is always necessary in order to describe a class. Even when the terms are enumerated, as "this and that and the other," the collection is constituted by the general property of being either this, or that, or the other, and only so acquires the unity which enables us to speak of it as _one_ collection. And in the case of an infinite class, enumeration is impossible, so that description by a general characteristic common and peculiar to the members of the class is the only possible description. Here, as we see, the theory of number to which Frege was led by purely logical considerations becomes of use in showing how infinite classes can be amenable to number in spite of being incapable of enumeration.

Frege next asks the question: When do two collections have the same number of terms? In ordinary life, we decide this question by counting; but counting, as we saw, is impossible in the case of infinite collections, and is not logically fundamental with finite collections. We want, therefore, a different method of answering our question. An illustration may help to make the method clear. I do not know how many married men there are in England, but I do know that the number is the same as the number of married women. The reason I know this is that the relation of husband and wife relates one man to one woman and one woman to one man. A relation of this sort is called a one-one relation. The relation of father to son is called a one-many relation, because a man can have only one father but may have many sons; conversely, the relation of son to father is called a many-one relation. But the relation of husband to wife (in Christian countries) is called one-one, because a man cannot have more than one wife, or a woman more than one husband. Now, whenever there is a one-one relation between all the terms of one collection and all the terms of another severally, as in the case of English husbands and English wives, the number of terms in the one collection is the same as the number in the other; but when there is not such a relation, the number is different. This is the answer to the question: When do two collections have the same number of terms?

We can now at last answer the question: What is meant by the number of terms in a given collection? When there is a one-one relation between all the terms of one collection and all the terms of another severally, we shall say that the two collections are "similar." We have just seen that two similar collections have the same number of terms. This leads us to define the number of a given collection as the class of all collections that are similar to it; that is to say, we set up the following formal definition:

"The number of terms in a given class" is defined as meaning "the class of all classes that are similar to the given class."

This definition, as Frege (expressing it in slightly different terms) showed, yields the usual arithmetical properties of numbers. It is applicable equally to finite and infinite numbers, and it does not require the admission of some new and mysterious set of metaphysical entities. It shows that it is not physical objects, but classes or the general terms by which they are defined, of which numbers can be asserted; and it applies to 0 and 1 without any of the difficulties which other theories find in dealing with these two special cases.

The above definition is sure to produce, at first sight, a feeling of oddity, which is liable to cause a certain dissatisfaction. It defines the number 2, for instance, as the class of all couples, and the number 3 as the class of all triads. This does not _seem_ to be what we have hitherto been meaning when we spoke of 2 and 3, though it would be difficult to say _what_ we had been meaning. The answer to a feeling cannot be a logical argument, but nevertheless the answer in this case is not without importance. In the first place, it will be found that when an idea which has grown familiar as an unanalysed whole is first resolved accurately into its component parts--which is what we do when we define it--there is almost always a feeling of unfamiliarity produced by the analysis, which tends to cause a protest against the definition. In the second place, it may be admitted that the definition, like all definitions, is to a certain extent arbitrary. In the case of the small finite numbers, such as 2 and 3, it would be possible to frame definitions more nearly in accordance with our unanalysed feeling of what we mean; but the method of such definitions would lack uniformity, and

would be found to fail sooner or later--at latest when we reached infinite numbers.

In the third place, the real desideratum about such a definition as that of number is not that it should represent as nearly as possible the ideas of those who have not gone through the analysis required in order to reach a definition, but that it should give us objects having the requisite properties. Numbers, in fact, must satisfy the formulae of arithmetic; any indubitable set of objects fulfilling this requirement may be called numbers. So far, the simplest set known to fulfil this requirement is the set introduced by the above definition. In comparison with this merit, the question whether the objects to which the definition applies are like or unlike the vague ideas of numbers entertained by those who cannot give a definition, is one of very little importance. All the important requirements are fulfilled by the above definition, and the sense of oddity which is at first unavoidable will be found to wear off very quickly with the growth of familiarity.

There is, however, a certain logical doctrine which may be thought to form an objection to the above definition of numbers as classes of classes--I mean the doctrine that there are no such objects as classes at all. It might be thought that this doctrine would make havoc of a theory which reduces numbers to classes, and of the many other theories in which we have made use of classes. This, however, would be a mistake: none of these theories are any the worse for the doctrine that classes are fictions. What the doctrine is, and why it is not destructive, I will try briefly to explain.

On account of certain rather complicated difficulties, culminating in definite contradictions, I was led to the view that nothing that can be said significantly about things, _i.e._ particulars, can be said significantly (_i.e._ either truly or falsely) about classes of things. That is to say, if, in any sentence in which a thing is mentioned, you substitute a class for the thing, you no longer have a sentence that has any meaning: the sentence is no longer either true or false, but a meaningless collection of words. Appearances to the contrary can be dispelled by a moment's reflection. For example, in the sentence, "Adam is fond of apples," you may substitute _mankind_, and say, "Mankind is fond of apples." But obviously you do not mean that there is one individual, called "mankind," which munches apples: you mean that the separate individuals who compose mankind are each severally fond of apples.

Now, if nothing that can be said significantly about a thing can be said significantly about a class of things, it follows that classes of things cannot have the same kind of reality as things have; for if they had, a class could be substituted for a thing in a proposition predicating the kind of reality which would be common to both. This view is really consonant to common sense. In the third or fourth century B.C. there lived a Chinese philosopher named Hui Tzu, who maintained that "a bay horse and a dun cow are three; because taken separately they are two, and taken together they are one: two and one make three."[53] The author from whom I quote says that Hui Tzu "was particularly fond of the quibbles which so delighted the sophists or unsound reasoners of ancient Greece," and this no doubt represents the judgment of common sense upon such arguments. Yet if collections of things were things, his contention would be irrefragable. It is only because the bay horse and the dun cow taken together are not a new thing that we can escape the conclusion that there are three things wherever there are two.

[53] Giles, _The Civilisation of China_ (Home University Library), p. 147.

When it is admitted that classes are not things, the question arises: What do we mean by statements which are nominally about classes? Take such a statement as, "The class of people interested in mathematical logic is not very numerous." Obviously this reduces itself to, "Not very many people are interested in mathematical logic." For the sake of definiteness, let us substitute some particular number, say 3, for "very many." Then our statement is, "Not three people are interested in mathematical logic." This may be expressed in the form: "If _x_ is interested in mathematical logic, and also _y_ is interested, and also _z_ is interested, then _x_ is identical with _y_, or _x_ is identical with _z_, or _y_ is identical with _z_." Here there is no longer any reference at all to a "class." In some such way, all statements nominally about a class can be reduced to statements about what follows from the hypothesis of anything's having the defining property of the class. All that is wanted, therefore, in order to render the _verbal_ use of classes legitimate, is a uniform method of interpreting propositions in which such a use occurs, so as to obtain propositions in which there is no longer any such use. The definition of such a method is a technical matter, which Dr Whitehead and I have dealt with elsewhere, and which we need not enter into on this occasion.[54]

[54] Cf. _Principia Mathematica_, Sec. 20, and Introduction, chapter iii.

If the theory that classes are merely symbolic is accepted, it follows that numbers are not actual entities, but that propositions in which numbers verbally occur have not really any constituents corresponding to numbers, but only a certain logical form which is not a part of propositions having this form. This is in fact the case with all the apparent objects of logic and mathematics. Such

words as _or_, _not_, _if_, _there is_, _identity_, _greater_, _plus_, _nothing_, _everything_, _function_, and so on, are not names of definite objects, like "John" or "Jones," but are words which require a context in order to have meaning. All of them are _formal_, that is to say, their occurrence indicates a certain form of proposition, not a certain constituent. "Logical constants," in short, are not entities; the words expressing them are not names, and cannot significantly be made into logical subjects except when it is the words themselves, as opposed to their meanings, that are being discussed.[55] This fact has a very important bearing on all logic and philosophy, since it shows how they differ from the special sciences. But the questions raised are so large and so difficult that it is impossible to pursue them further on this occasion.

[55] In the above remarks I am making use of unpublished work by my friend Ludwig Wittgenstein.

LECTURE VIII

ON THE NOTION OF CAUSE, WITH APPLICATIONS TO THE FREE-WILL PROBLEM

The nature of philosophic analysis, as illustrated in our previous lectures, can now be stated in general terms. We start from a body of common knowledge, which constitutes our data. On examination, the data are found to be complex, rather vague, and largely interdependent logically. By analysis we reduce them to propositions which are as nearly as possible simple and precise, and we arrange them in deductive chains, in which a certain number of initial propositions form a logical guarantee for all the rest. These initial propositions are _premisses_ for the body of knowledge in question. Premisses are thus quite different from data--they are simpler, more precise, and less infected with logical redundancy. If the work of analysis has been performed completely, they will be wholly free from logical redundancy, wholly precise, and as simple as is logically compatible with their leading to the given body of knowledge. The discovery of these premisses belongs to philosophy; but the work of deducing the body of common knowledge from them belongs to mathematics, if "mathematics" is interpreted in a somewhat liberal sense.

But besides the logical analysis of the common knowledge which forms our data, there is the consideration of its degree of certainty. When we have arrived at its premisses, we may find that some of them seem open to doubt, and we may find further that this doubt extends to those of our original data which depend upon these doubtful premisses. In our third lecture, for example, we saw that the part of physics which depends upon testimony, and thus upon the existence of other minds than our own, does not seem so certain as the part which depends exclusively upon our own sense-data and the laws of logic. Similarly, it used to be felt that the parts of geometry which depend upon the axiom of parallels have less certainty than the parts which are independent of this premiss. We may say, generally, that what commonly passes as knowledge is not all equally certain, and that, when analysis into premisses has been effected, the degree of certainty of any consequence of the premisses will depend upon that of the most doubtful premiss employed in proving this consequence. Thus analysis into premisses serves not only a logical purpose, but also the purpose of facilitating an estimate as to the degree of certainty to be attached to this or that derivative belief. In view of the fallibility of all human beliefs, this service seems at least as important as the purely logical services rendered by philosophical analysis.

In the present lecture, I wish to apply the analytic method to the notion of "cause," and to illustrate the discussion by applying it to the problem of free will. For this purpose I shall inquire: I., what is meant by a causal law; II., what is the evidence that causal laws have held hitherto; III., what is the evidence that they will continue to hold in the future; IV., how the causality which is used in science differs from that of common sense and traditional philosophy; V., what new light is thrown on the question of free will by our analysis of the notion of "cause."

I. By a "causal law" I mean any general proposition in virtue of which it is possible to infer the existence of one thing or event from the existence of another or of a number of others. If you hear thunder without having seen lightning, you infer that there nevertheless was a flash, because of the general proposition, "All thunder is preceded by lightning." When Robinson Crusoe sees a footprint, he infers a human being, and he might justify his inference by the general proposition, "All marks in the ground shaped like a human foot are subsequent to a human being's standing where the marks are." When we see the sun set, we expect that it will rise again the next day. When we hear a man speaking, we infer that he has certain thoughts. All these inferences are due to causal laws.

A causal law, we said, allows us to infer the existence of one _thing_ (or _event_) from the existence of one or more others. The word "thing" here is to be understood as only applying to particulars, _i.e._ as excluding such logical objects as numbers or classes or abstract properties and relations, and including sense-data, with whatever is logically of the same type as sense-data.[56] In so

far as a causal law is directly verifiable, the thing inferred and the thing from which it is inferred must both be data, though they need not both be data at the same time. In fact, a causal law which is being used to extend our knowledge of existence must be applied to what, at the moment, is not a datum; it is in the possibility of such application that the practical utility of a causal law consists. The important point, for our present purpose, however, is that what is inferred is a "thing," a "particular," an object having the kind of reality that belongs to objects of sense, not an abstract object such as virtue or the square root of two.

[56] Thus we are not using "thing" here in the sense of a class of correlated "aspects," as we did in Lecture III. Each "aspect" will count separately in stating causal laws.

But we cannot become acquainted with a particular except by its being actually given. Hence the particular inferred by a causal law must be only _described_ with more or less exactness; it cannot be _named_ until the inference is verified. Moreover, since the causal law is _general_, and capable of applying to many cases, the given particular from which we infer must allow the inference in virtue of some general characteristic, not in virtue of its being just the particular that it is. This is obvious in all our previous instances: we infer the unperceived lightning from the thunder, not in virtue of any peculiarity of the thunder, but in virtue of its resemblance to other claps of thunder. Thus a causal law must state that the existence of a thing of a certain sort (or of a number of things of a number of assigned sorts) implies the existence of another thing having a relation to the first which remains invariable so long as the first is of the kind in question.

It is to be observed that what is constant in a causal law is not the object or objects given, nor yet the object inferred, both of which may vary within wide limits, but the _relation_ between what is given and what is inferred. The principle, "same cause, same effect," which is sometimes said to be the principle of causality, is much narrower in its scope than the principle which really occurs in science; indeed, if strictly interpreted, it has no scope at all, since the "same" cause never recurs exactly. We shall return to this point at a later stage of the discussion.

The particular which is inferred may be uniquely determined by the causal law, or may be only described in such general terms that many different particulars might satisfy the description. This depends upon whether the constant relation affirmed by the causal law is one which only one term can have to the data, or one which many terms may have. If many terms may have the relation in question, science will not be satisfied until it has found some more stringent law, which will enable us to determine the inferred things uniquely.

Since all known things are in time, a causal law must take account of temporal relations. It will be part of the causal law to state a relation of succession or coexistence between the thing given and the thing inferred. When we hear thunder and infer that there was lightning, the law states that the thing inferred is earlier than the thing given. Conversely, when we see lightning and wait expectantly for the thunder, the law states that the thing given is earlier than the thing inferred. When we infer a man's thoughts from his words, the law states that the two are (at least approximately) simultaneous.

If a causal law is to achieve the precision at which science aims, it must not be content with a vague _earlier_ or _later_, but must state how much earlier or how much later. That is to say, the time-relation between the thing given and the thing inferred ought to be capable of exact statement; and usually the inference to be drawn is different according to the length and direction of the interval. "A quarter of an hour ago this man was alive; an hour hence he will be cold." Such a statement involves two causal laws, one inferring from a datum something which existed a quarter of an hour ago, the other inferring from the same datum something which will exist an hour hence.

Often a causal law involves not one datum, but many, which need not be all simultaneous with each other, though their time-relations must be given. The general scheme of a causal law will be as follows:

"Whenever things occur in certain relations to each other (among which their time-relations must be included), then a thing having a fixed relation to these things will occur at a date fixed relatively to their dates."

The things given will not, in practice, be things that only exist for an instant, for such things, if there are any, can never be data. The things given will each occupy some finite time. They may be not static things, but processes, especially motions. We have considered in an earlier lecture the sense in which a motion may be a datum, and need not now recur to this topic.

It is not essential to a causal law that the object inferred should be later than some or all of the data. It may equally well be earlier or at the same time. The only thing essential is that the law should be such as to enable us to infer the existence of an object which we can more or less accurately describe in terms of the data.

II. I come now to our second question, namely: What is the nature of the evidence that causal laws have held hitherto, at least in the observed portions of the past? This question must not be confused with the further question: Does this evidence warrant us in assuming the truth of causal laws in the future and in unobserved portions of the past? For the present, I am only asking what are the grounds which lead to a belief in causal laws, not whether these grounds are adequate to support the belief in universal causation.

The first step is the discovery of approximate unanalysed uniformities of sequence or coexistence. After lightning comes thunder, after a blow received comes pain, after approaching a fire comes warmth; again, there are uniformities of coexistence, for example between touch and sight, between certain sensations in the throat and the sound of one's own voice, and so on. Every such uniformity of sequence or coexistence, after it has been experienced a certain number of times, is followed by an expectation that it will be repeated on future occasions, _i.e._ that where one of the correlated events is found, the other will be found also. The connection of experienced past uniformity with expectation as to the future is just one of those uniformities of sequence which we have observed to be true hitherto. This affords a psychological account of what may be called the animal belief in causation, because it is something which can be observed in horses and dogs, and is rather a habit of acting than a real belief. So far, we have merely repeated Hume, who carried the discussion of cause up to this point, but did not, apparently, perceive how much remained to be said.

Is there, in fact, any characteristic, such as might be called causality or uniformity, which is found to hold throughout the observed past? And if so, how is it to be stated?

The particular uniformities which we mentioned before, such as lightning being followed by thunder, are not found to be free from exceptions. We sometimes see lightning without hearing thunder; and although, in such a case, we suppose that thunder might have been heard if we had been nearer to the lightning, that is a supposition based on theory, and therefore incapable of being invoked to support the theory. What does seem, however, to be shown by scientific experience is this: that where an observed uniformity fails, some wider uniformity can be found, embracing more circumstances, and subsuming both the successes and the failures of the previous uniformity. Unsupported bodies in air fall, unless they are balloons or aeroplanes; but the principles of mechanics give uniformities which apply to balloons and aeroplanes just as accurately as to bodies that fall. There is much that is hypothetical and more or less artificial in the uniformities affirmed by mechanics, because, when they cannot otherwise be made applicable, unobserved bodies are inferred in order to account for observed peculiarities. Still, it is an empirical fact that it is possible to preserve the laws by assuming such bodies, and that they never have to be assumed in circumstances in which they ought to be observable. Thus the empirical verification of mechanical laws may be admitted, although we must also admit that it is less complete and triumphant than is sometimes supposed.

Assuming now, what must be admitted to be doubtful, that the whole of the past has proceeded according to invariable laws, what can we say as to the nature of these laws? They will not be of the simple type which asserts that the same cause always produces the same effect. We may take the law of gravitation as a sample of the kind of law that appears to be verified without exception. In order to state this law in a form which observation can confirm, we will confine it to the solar system. It then states that the motions of planets and their satellites have at every instant an acceleration compounded of accelerations towards all the other bodies in the solar system, proportional to the masses of those bodies and inversely proportional to the squares of their distances. In virtue of this law, given the state of the solar system throughout any finite time, however short, its state at all earlier and later times is determinate except in so far as other forces than gravitation or other bodies than those in the solar system have to be taken into consideration. But other forces, so far as science can discover, appear to be equally regular, and equally capable of being summed up in single causal laws. If the mechanical account of matter were complete, the whole physical history of the universe, past and future, could be inferred from a sufficient number of data concerning an assigned finite time, however short.

In the mental world, the evidence for the universality of causal laws is less complete than in the physical world. Psychology cannot boast of any triumph comparable to gravitational astronomy. Nevertheless, the evidence is not very greatly less than in the physical world. The crude and approximate causal laws from which science starts are just as easy to discover in the mental sphere as in the physical. In the world of sense, there are to begin with the correlations of sight and touch and so on, and the facts which lead us to connect various kinds of sensations with eyes, ears, nose, tongue, etc. Then there are such facts as that our body moves in answer to our volitions. Exceptions exist, but are capable of being explained as easily as the exceptions to the rule that unsupported bodies in air fall. There is, in fact, just such a degree of evidence for causal laws in psychology as will warrant the psychologist in assuming them as a matter of course, though not such a degree as will suffice to remove all doubt from the mind of a sceptical inquirer. It

should be observed that causal laws in which the given term is mental and the inferred term physical, or _vice versa_, are at least as easy to discover as causal laws in which both terms are mental.

It will be noticed that, although we have spoken of causal laws, we have not hitherto introduced the word "cause." At this stage, it will be well to say a few words on legitimate and illegitimate uses of this word. The word "cause," in the scientific account of the world, belongs only to the early stages, in which small preliminary, approximate generalisations are being ascertained with a view to subsequent larger and more invariable laws. We may say, "Arsenic causes death," so long as we are ignorant of the precise process by which the result is brought about. But in a sufficiently advanced science, the word "cause" will not occur in any statement of invariable laws. There is, however, a somewhat rough and loose use of the word "cause" which may be preserved. The approximate uniformities which lead to its pre-scientific employment may turn out to be true in all but very rare and exceptional circumstances, perhaps in all circumstances that actually occur. In such cases, it is convenient to be able to speak of the antecedent event as the "cause" and the subsequent event as the "effect." In this sense, provided it is realised that the sequence is not necessary and may have exceptions, it is still possible to employ the words "cause" and "effect." It is in this sense, and in this sense only, that we shall intend the words when we speak of one particular event "causing" another particular event, as we must sometimes do if we are to avoid intolerable circumlocution.

III. We come now to our third question, namely: What reason can be given for believing that causal laws will hold in future, or that they have held in unobserved portions of the past?

What we have said so far is that there have been hitherto certain observed causal laws, and that all the empirical evidence we possess is compatible with the view that everything, both mental and physical, so far as our observation has extended, has happened in accordance with causal laws. The law of universal causation, suggested by these facts, may be enunciated as follows:

"There are such invariable relations between different events at the same or different times that, given the state of the whole universe throughout any finite time, however short, every previous and subsequent event can theoretically be determined as a function of the given events during that time."

Have we any reason to believe this universal law? Or, to ask a more modest question, have we any reason to believe that a particular causal law, such as the law of gravitation, will continue to hold in the future?

Among observed causal laws is this, that observation of uniformities is followed by expectation of their recurrence. A horse who has been driven always along a certain road expects to be driven along that road again; a dog who is always fed at a certain hour expects food at that hour and not at any other. Such expectations, as Hume pointed out, explain only too well the common-sense belief in uniformities of sequence, but they afford absolutely no logical ground for beliefs as to the future, not even for the belief that we shall continue to expect the continuation of experienced uniformities, for that is precisely one of those causal laws for which a ground has to be sought. If Hume's account of causation is the last word, we have not only no reason to suppose that the sun will rise to-morrow, but no reason to suppose that five minutes hence we shall still expect it to rise to-morrow.

It may, of course, be said that all inferences as to the future are in fact invalid, and I do not see how such a view could be disproved. But, while admitting the legitimacy of such a view, we may nevertheless inquire: If inferences as to the future _are_ valid, what principle must be involved in making them?

The principle involved is the principle of induction, which, if it is true, must be an _a priori_ logical law, not capable of being proved or disproved by experience. It is a difficult question how this principle ought to be formulated; but if it is to warrant the inferences which we wish to make by its means, it must lead to the following proposition: "If, in a great number of instances, a thing of a certain kind is associated in a certain way with a thing of a certain other kind, it is probable that a thing of the one kind is always similarly associated with a thing of the other kind; and as the number of instances increases, the probability approaches indefinitely near to certainty." It may well be questioned whether this proposition is true; but if we admit it, we can infer that any characteristic of the whole of the observed past is likely to apply to the future and to the unobserved past. This proposition, therefore, if it is true, will warrant the inference that causal laws probably hold at all times, future as well as past; but without this principle, the observed cases of the truth of causal laws afford no presumption as to the unobserved cases, and therefore the existence of a thing not directly observed can never be validly inferred.

It is thus the principle of induction, rather than the law of causality, which is at the bottom of all inferences as to the existence of things not immediately given. With the principle of induction, all that is wanted for such inferences can be proved; without it, all such

inferences are invalid. This principle has not received the attention which its great importance deserves. Those who were interested in deductive logic naturally enough ignored it, while those who emphasised the scope of induction wished to maintain that all logic is empirical, and therefore could not be expected to realise that induction itself, their own darling, required a logical principle which obviously could not be proved inductively, and must therefore be _a priori_ if it could be known at all.

The view that the law of causality itself is _a priori_ cannot, I think, be maintained by anyone who realises what a complicated principle it is. In the form which states that "every event has a cause" it looks simple; but on examination, "cause" is merged in "causal law," and the definition of a "causal law" is found to be far from simple. There must necessarily be _some a priori_ principle involved in inference from the existence of one thing to that of another, if such inference is ever valid; but it would appear from the above analysis that the principle in question is induction, not causality. Whether inferences from past to future are valid depends wholly, if our discussion has been sound, upon the inductive principle: if it is true, such inferences are valid, and if it is false, they are invalid.

IV. I come now to the question how the conception of causal laws which we have arrived at is related to the traditional conception of cause as it occurs in philosophy and common sense.

Historically, the notion of cause has been bound up with that of human volition. The typical cause would be the fiat of a king. The cause is supposed to be "active," the effect "passive." From this it is easy to pass on to the suggestion that a "true" cause must contain some prevision of the effect; hence the effect becomes the "end" at which the cause aims, and teleology replaces causation in the explanation of nature. But all such ideas, as applied to physics, are mere anthropomorphic superstitions. It is as a reaction against these errors that Mach and others have urged a purely "descriptive" view of physics: physics, they say, does not aim at telling us "why" things happen, but only "how" they happen. And if the question "why?" means anything more than the search for a general law according to which a phenomenon occurs, then it is certainly the case that this question cannot be answered in physics and ought not to be asked. In this sense, the descriptive view is indubitably in the right. But in using causal laws to support inferences from the observed to the unobserved, physics ceases to be _purely_ descriptive, and it is these laws which give the scientifically useful part of the traditional notion of "cause." There is therefore _something_ to preserve in this notion, though it is a very tiny part of what is commonly assumed in orthodox metaphysics.

In order to understand the difference between the kind of cause which science uses and the kind which we naturally imagine, it is necessary to shut out, by an effort, everything that differentiates between past and future. This is an extraordinarily difficult thing to do, because our mental life is so intimately bound up with difference. Not only do memory and hope make a difference in our feelings as regards past and future, but almost our whole vocabulary is filled with the idea of activity, of things done now for the sake of their future effects. All transitive verbs involve the notion of cause as activity, and would have to be replaced by some cumbrous periphrasis before this notion could be eliminated.

Consider such a statement as, "Brutus killed Caesar." On another occasion, Brutus and Caesar might engage our attention, but for the present it is the killing that we have to study. We may say that to kill a person is to cause his death intentionally. This means that desire for a person's death causes a certain act, because it is believed that that act will cause the person's death; or more accurately, the desire and the belief jointly cause the act. Brutus desires that Caesar should be dead, and believes that he will be dead if he is stabbed; Brutus therefore stabs him, and the stab causes Caesar's death, as Brutus expected it would. Every act which realises a purpose involves two causal steps in this way: C is desired, and it is believed (truly if the purpose is achieved) that B will cause C; the desire and the belief together cause B, which in turn causes C. Thus we have first A, which is a desire for C and a belief that B (an act) will cause C; then we have B, the act caused by A, and believed to be a cause of C; then, if the belief was correct, we have C, caused by B, and if the belief was incorrect we have disappointment. Regarded purely scientifically, this series A, B, C may equally well be considered in the inverse order, as they would be at a coroner's inquest. But from the point of view of Brutus, the desire, which comes at the beginning, is what makes the whole series interesting. We feel that if his desires had been different, the effects which he in fact produced would not have occurred. This is true, and gives him a sense of power and freedom. It is equally true that if the effects had not occurred, his desires would have been different, since being what they were the effects did occur. Thus the desires are determined by their consequences just as much as the consequences by the desires; but as we cannot (in general) know in advance the consequences of our desires without knowing our desires, this form of inference is uninteresting as applied to our own acts, though quite vital as applied to those of others.

A cause, considered scientifically, has none of that analogy with volition which makes us imagine that the effect is _compelled_ by it. A cause is an event or group of events, of some known general character, and having a known relation to some other event,

called the effect; the relation being of such a kind that only one event, or at any rate only one well-defined sort of event, can have the relation to a given cause. It is customary only to give the name "effect" to an event which is later than the cause, but there is no kind of reason for this restriction. We shall do better to allow the effect to be before the cause or simultaneous with it, because nothing of any scientific importance depends upon its being after the cause.

If the inference from cause to effect is to be indubitable, it seems that the cause can hardly stop short of the whole universe. So long as anything is left out, something may be left out which alters the expected result. But for practical and scientific purposes, phenomena can be collected into groups which are causally self-contained, or nearly so. In the common notion of causation, the cause is a single event--we say the lightning causes the thunder, and so on. But it is difficult to know what we mean by a single event; and it generally appears that, in order to have anything approaching certainty concerning the effect, it is necessary to include many more circumstances in the cause than unscientific common sense would suppose. But often a probable causal connection, where the cause is fairly simple, is of more practical importance than a more indubitable connection in which the cause is so complex as to be hard to ascertain.

To sum up: the strict, certain, universal law of causation which philosophers advocate is an ideal, possibly true, but not _known_ to be true in virtue of any available evidence. What is actually known, as a matter of empirical science, is that certain constant relations are observed to hold between the members of a group of events at certain times, and that when such relations fail, as they sometimes do, it is usually possible to discover a new, more constant relation by enlarging the group. Any such constant relation between events of specified kinds with given intervals of time between them is a "causal law." But all causal laws are liable to exceptions, if the cause is less than the whole state of the universe; we believe, on the basis of a good deal of experience, that such exceptions can be dealt with by enlarging the group we call the cause, but this belief, wherever it is still unverified, ought not to be regarded as certain, but only as suggesting a direction for further inquiry.

A very common causal group consists of volitions and the consequent bodily acts, though exceptions arise (for example) through sudden paralysis. Another very frequent connection (though here the exceptions are much more numerous) is between a bodily act and the realisation of the purpose which led to the act. These connections are patent, whereas the causes of desires are more obscure. Thus it is natural to begin causal series with desires, to suppose that all causes are analogous to desires, and that desires themselves arise spontaneously. Such a view, however, is not one which any serious psychologist would maintain. But this brings us to the question of the application of our analysis of cause to the problem of free will.

V. The problem of free will is so intimately bound up with the analysis of causation that, old as it is, we need not despair of obtaining new light on it by the help of new views on the notion of cause. The free-will problem has, at one time or another, stirred men's passions profoundly, and the fear that the will might not be free has been to some men a source of great unhappiness. I believe that, under the influence of a cool analysis, the doubtful questions involved will be found to have no such emotional importance as is sometimes thought, since the disagreeable consequences supposed to flow from a denial of free will do not flow from this denial in any form in which there is reason to make it. It is not, however, on this account chiefly that I wish to discuss this problem, but rather because it affords a good example of the clarifying effect of analysis and of the interminable controversies which may result from its neglect.

Let us first try to discover what it is we really desire when we desire free will. Some of our reasons for desiring free will are profound, some trivial. To begin with the former: we do not wish to feel ourselves in the hands of fate, so that, however much we may desire to will one thing, we may nevertheless be compelled by an outside force to will another. We do not wish to think that, however much we may desire to act well, heredity and surroundings may force us into acting ill. We wish to feel that, in cases of doubt, our choice is momentous and lies within our power. Besides these desires, which are worthy of all respect, we have, however, others not so respectable, which equally make us desire free will. We do not like to think that other people, if they knew enough, could predict our actions, though we know that we can often predict those of other people, especially if they are elderly. Much as we esteem the old gentleman who is our neighbour in the country, we know that when grouse are mentioned he will tell the story of the grouse in the gun-room. But we ourselves are not so mechanical: we never tell an anecdote to the same person twice, or even once unless he is sure to enjoy it; although we once met (say) Bismarck, we are quite capable of hearing him mentioned without relating the occasion when we met him. In this sense, everybody thinks that he himself has free will, though he knows that no one else has. The desire for this kind of free will seems to be no better than a form of vanity. I do not believe that this desire can be gratified with any certainty; but the other, more respectable desires are, I believe, not inconsistent with any tenable form of determinism.

We have thus two questions to consider: (1) Are human actions theoretically predictable from a sufficient number of antecedents? (2) Are human actions subject to an external compulsion? The two questions, as I shall try to show, are entirely distinct, and we may answer the first in the affirmative without therefore being forced to give an affirmative answer to the second.

(1) _Are human actions theoretically predictable from a sufficient number of antecedents?_ Let us first endeavour to give precision to this question. We may state the question thus: Is there some constant relation between an act and a certain number of earlier events, such that, when the earlier events are given, only one act, or at most only acts with some well-marked character, can have this relation to the earlier events? If this is the case, then, as soon as the earlier events are known, it is theoretically possible to predict either the precise act, or at least the character necessary to its fulfilling the constant relation.

To this question, a negative answer has been given by Bergson, in a form which calls in question the general applicability of the law of causation. He maintains that every event, and more particularly every mental event, embodies so much of the past that it could not possibly have occurred at any earlier time, and is therefore necessarily quite different from all previous and subsequent events. If, for example, I read a certain poem many times, my experience on each occasion is modified by the previous readings, and my emotions are never repeated exactly. The principle of causation, according to him, asserts that the same cause, if repeated, will produce the same effect. But owing to memory, he contends, this principle does not apply to mental events. What is apparently the same cause, if repeated, is modified by the mere fact of repetition, and cannot produce the same effect. He infers that every mental event is a genuine novelty, not predictable from the past, because the past contains nothing exactly like it by which we could imagine it. And on this ground he regards the freedom of the will as unassailable.

Bergson's contention has undoubtedly a great deal of truth, and I have no wish to deny its importance. But I do not think its consequences are quite what he believes them to be. It is not necessary for the determinist to maintain that he can foresee the whole particularity of the act which will be performed. If he could foresee that A was going to murder B, his foresight would not be invalidated by the fact that he could not know all the infinite complexity of A's state of mind in committing the murder, nor whether the murder was to be performed with a knife or with a revolver. If the _kind_ of act which will be performed can be foreseen within narrow limits, it is of little practical interest that there are fine shades which cannot be foreseen. No doubt every time the story of the grouse in the gun-room is told, there will be slight differences due to increasing habitualness, but they do not invalidate the prediction that the story will be told. And there is nothing in Bergson's argument to show that we can never predict what _kind_ of act will be performed.

Again, his statement of the law of causation is inadequate. The law does not state merely that, if the _same_ cause is repeated, the _same_ effect will result. It states rather that there is a constant relation between causes of certain kinds and effects of certain kinds. For example, if a body falls freely, there is a constant relation between the height through which it falls and the time it takes in falling. It is not necessary to have a body fall through the _same_ height which has been previously observed, in order to be able to foretell the length of time occupied in falling. If this were necessary, no prediction would be possible, since it would be impossible to make the height exactly the same on two occasions. Similarly, the attraction which the sun will exert on the earth is not only known at distances for which it has been observed, but at all distances, because it is known to vary as the inverse square of the distance. In fact, what is found to be repeated is always the _relation_ of cause and effect, not the cause itself; all that is necessary as regards the cause is that it should be of the same _kind_ (in the relevant respect) as earlier causes whose effects have been observed.

Another respect in which Bergson's statement of causation is inadequate is in its assumption that the cause must be _one_ event, whereas it may be two or more events, or even some continuous process. The substantive question at issue is whether mental events are determined by the past. Now in such a case as the repeated reading of a poem, it is obvious that our feelings in reading the poem are most emphatically dependent upon the past, but not upon one single event in the past. All our previous readings of the poem must be included in the cause. But we easily perceive a certain law according to which the effect varies as the previous readings increase in number, and in fact Bergson himself tacitly assumes such a law. We decide at last not to read the poem again, because we know that this time the effect would be boredom. We may not know all the niceties and shades of the boredom we should feel, but we know enough to guide our decision, and the prophecy of boredom is none the less true for being more or less general. Thus the kinds of cases upon which Bergson relies are insufficient to show the impossibility of prediction in the only sense in which prediction has practical or emotional interest. We may therefore leave the consideration of his arguments and address ourselves to the problem directly.

The law of causation, according to which later events can theoretically be predicted by means of earlier events, has often been held to be _a priori_, a necessity of thought, a category without which science would be impossible. These claims seem to me excessive. In certain directions the law has been verified empirically, and in other directions there is no positive evidence against it. But science can use it where it has been found to be true, without being forced into any assumption as to its truth in other fields. We cannot, therefore, feel any _a priori_ certainty that causation must apply to human volitions.

The question how far human volitions are subject to causal laws is a purely empirical one. Empirically it seems plain that the great majority of our volitions have causes, but it cannot, on this account, be held necessarily certain that all have causes. There are, however, precisely the same kinds of reasons for regarding it as probable that they all have causes as there are in the case of physical events.

We may suppose--though this is doubtful--that there are laws of correlation of the mental and the physical, in virtue of which, given the state of all the matter in the world, and therefore of all the brains and living organisms, the state of all the minds in the world could be inferred, while conversely the state of all the matter in the world could be inferred if the state of all the minds were given. It is obvious that there is _some_ degree of correlation between brain and mind, and it is impossible to say how complete it may be. This, however, is not the point which I wish to elicit. What I wish to urge is that, even if we admit the most extreme claims of determinism and of correlation of mind and brain, still the consequences inimical to what is worth preserving in free will do not follow. The belief that they follow results, I think, entirely from the assimilation of causes to volitions, and from the notion that causes _compel_ their effects in some sense analogous to that in which a human authority can compel a man to do what he would rather not do. This assimilation, as soon as the true nature of scientific causal laws is realised, is seen to be a sheer mistake. But this brings us to the second of the two questions which we raised in regard to free will, namely, whether, assuming determinism, our actions can be in any proper sense regarded as compelled by outside forces.

(2) _Are human actions subject to an external compulsion?_ We have, in deliberation, a subjective sense of freedom, which is sometimes alleged against the view that volitions have causes. This sense of freedom, however, is only a sense that we can choose which we please of a number of alternatives: it does not show us that there is no causal connection between what we please to choose and our previous history. The supposed inconsistency of these two springs from the habit of conceiving causes as analogous to volitions--a habit which often survives unconsciously in those who intend to conceive causes in a more scientific manner. If a cause is analogous to a volition, outside causes will be analogous to an alien will, and acts predictable from outside causes will be subject to compulsion. But this view of cause is one to which science lends no countenance. Causes, we have seen, do not _compel_ their effects, any more than effects _compel_ their causes. There is a mutual relation, so that either can be inferred from the other. When the geologist infers the past state of the earth from its present state, we should not say that the present state _compels_ the past state to have been what it was; yet it renders it necessary as a consequence of the data, in the only sense in which effects are rendered necessary by their causes. The difference which we _feel_, in this respect, between causes and effects is a mere confusion due to the fact that we remember past events but do not happen to have memory of the future.

The apparent indeterminateness of the future, upon which some advocates of free will rely, is merely a result of our ignorance. It is plain that no desirable kind of free will can be dependent simply upon our ignorance; for if that were the case, animals would be more free than men, and savages than civilised people. Free will in any valuable sense must be compatible with the fullest knowledge. Now, quite apart from any assumption as to causality, it is obvious that complete knowledge would embrace the future as well as the past. Our knowledge of the past is not wholly based upon causal inferences, but is partly derived from memory. It is a mere accident that we have no memory of the future. We might--as in the pretended visions of seers--see future events immediately, in the way in which we see past events. They certainly will be what they will be, and are in this sense just as determined as the past. If we saw future events in the same immediate way in which we see past events, what kind of free will would still be possible? Such a kind would be wholly independent of determinism: it could not be contrary to even the most entirely universal reign of causality. And such a kind must contain whatever is worth having in free will, since it is impossible to believe that mere ignorance can be the essential condition of any good thing. Let us therefore imagine a set of beings who know the whole future with absolute certainty, and let us ask ourselves whether they could have anything that we should call free will.

Such beings as we are imagining would not have to wait for the event in order to know what decision they were going to adopt on some future occasion. They would know now what their volitions were going to be. But would they have any reason to regret this knowledge? Surely not, unless the foreseen volitions were in themselves regrettable. And it is less likely that the foreseen volitions would be regrettable if the steps which would lead to them were also foreseen. It is difficult not to suppose that what is foreseen is

fated, and must happen however much it may be dreaded. But human actions are the outcome of desire, and no foreseeing can be true unless it takes account of desire. A foreseen volition will have to be one which does not become odious through being foreseen. The beings we are imagining would easily come to know the causal connections of volitions, and therefore their volitions would be better calculated to satisfy their desires than ours are. Since volitions are the outcome of desires, a prevision of volitions contrary to desires could not be a true one. It must be remembered that the supposed prevision would not create the future any more than memory creates the past. We do not think we were necessarily not free in the past, merely because we can now remember our past volitions. Similarly, we might be free in the future, even if we could now see what our future volitions were going to be. Freedom, in short, in any valuable sense, demands only that our volitions shall be, as they are, the result of our own desires, not of an outside force compelling us to will what we would rather not will. Everything else is confusion of thought, due to the feeling that knowledge _compels_ the happening of what it knows when this is future, though it is at once obvious that knowledge has no such power in regard to the past. Free will, therefore, is true in the only form which is important; and the desire for other forms is a mere effect of insufficient analysis.

* * * * *

What has been said on philosophical method in the foregoing lectures has been rather by means of illustrations in particular cases than by means of general precepts. Nothing of any value can be said on method except through examples; but now, at the end of our course, we may collect certain general maxims which may possibly be a help in acquiring a philosophical habit of mind and a guide in looking for solutions of philosophic problems.

Philosophy does not become scientific by making use of other sciences, in the kind of way in which (_e.g._) Herbert Spencer does. Philosophy aims at what is _general_, and the special sciences, however they may _suggest_ large generalisations, cannot make them certain. And a hasty generalisation, such as Spencer's generalisation of evolution, is none the less hasty because what is generalised is the latest scientific theory. Philosophy is a study apart from the other sciences: its results cannot be established by the other sciences, and conversely must not be such as some other science might conceivably contradict. Prophecies as to the future of the universe, for example, are not the business of philosophy; whether the universe is progressive, retrograde, or stationary, it is not for the philosopher to say.

In order to become a scientific philosopher, a certain peculiar mental discipline is required. There must be present, first of all, the desire to know philosophical truth, and this desire must be sufficiently strong to survive through years when there seems no hope of its finding any satisfaction. The desire to know philosophical truth is very rare--in its purity, it is not often found even among philosophers. It is obscured sometimes--particularly after long periods of fruitless search--by the desire to _think_ we know. Some plausible opinion presents itself, and by turning our attention away from the objections to it, or merely by not making great efforts to find objections to it, we may obtain the comfort of believing it, although, if we had resisted the wish for comfort, we should have come to see that the opinion was false. Again the desire for unadulterated truth is often obscured, in professional philosophers, by love of system: the one little fact which will not come inside the philosopher's edifice has to be pushed and tortured until it seems to consent. Yet the one little fact is more likely to be important for the future than the system with which it is inconsistent. Pythagoras invented a system which fitted admirably with all the facts he knew, except the incommensurability of the diagonal of a square and the side; this one little fact stood out, and remained a fact even after Hippasos of Metapontion was drowned for revealing it. To us, the discovery of this fact is the chief claim of Pythagoras to immortality, while his system has become a matter of merely historical curiosity.[57] Love of system, therefore, and the system-maker's vanity which becomes associated with it, are among the snares that the student of philosophy must guard against.

[57] The above remarks, for purposes of illustration, adopt one of several possible opinions on each of several disputed points.

The desire to establish this or that result, or generally to discover evidence for agreeable results, of whatever kind, has of course been the chief obstacle to honest philosophising. So strangely perverted do men become by unrecognised passions, that a determination in advance to arrive at this or that conclusion is generally regarded as a mark of virtue, and those whose studies lead to an opposite conclusion are thought to be wicked. No doubt it is commoner to wish to arrive at an agreeable result than to wish to arrive at a true result. But only those in whom the desire to arrive at a _true_ result is paramount can hope to serve any good purpose by the study of philosophy.

But even when the desire to know exists in the requisite strength, the mental vision by which abstract truth is recognised is hard to distinguish from vivid imaginability and consonance with mental habits. It is necessary to practise methodological doubt, like

Descartes, in order to loosen the hold of mental habits; and it is necessary to cultivate logical imagination, in order to have a number of hypotheses at command, and not to be the slave of the one which common sense has rendered easy to imagine. These two processes, of doubting the familiar and imagining the unfamiliar, are correlative, and form the chief part of the mental training required for a philosopher.

The naive beliefs which we find in ourselves when we first begin the process of philosophic reflection may turn out, in the end, to be almost all capable of a true interpretation; but they ought all, before being admitted into philosophy, to undergo the ordeal of sceptical criticism. Until they have gone through this ordeal, they are mere blind habits, ways of behaving rather than intellectual convictions. And although it may be that a majority will pass the test, we may be pretty sure that some will not, and that a serious readjustment of our outlook ought to result. In order to break the dominion of habit, we must do our best to doubt the senses, reason, morals, everything in short. In some directions, doubt will be found possible; in others, it will be checked by that direct vision of abstract truth upon which the possibility of philosophical knowledge depends.

At the same time, and as an essential aid to the direct perception of the truth, it is necessary to acquire fertility in imagining abstract hypotheses. This is, I think, what has most of all been lacking hitherto in philosophy. So meagre was the logical apparatus that all the hypotheses philosophers could imagine were found to be inconsistent with the facts. Too often this state of things led to the adoption of heroic measures, such as a wholesale denial of the facts, when an imagination better stocked with logical tools would have found a key to unlock the mystery. It is in this way that the study of logic becomes the central study in philosophy: it gives the method of research in philosophy, just as mathematics gives the method in physics. And as physics, which, from Plato to the Renaissance, was as unprogressive, dim, and superstitious as philosophy, became a science through Galileo's fresh observation of facts and subsequent mathematical manipulation, so philosophy, in our own day, is becoming scientific through the simultaneous acquisition of new facts and logical methods.

In spite, however, of the new possibility of progress in philosophy, the first effect, as in the case of physics, is to diminish very greatly the extent of what is thought to be known. Before Galileo, people believed themselves possessed of immense knowledge on all the most interesting questions in physics. He established certain facts as to the way in which bodies fall, not very interesting on their own account, but of quite immeasurable interest as examples of real knowledge and of a new method whose future fruitfulness he himself divined. But his few facts sufficed to destroy the whole vast system of supposed knowledge handed down from Aristotle, as even the palest morning sun suffices to extinguish the stars. So in philosophy: though some have believed one system, and others another, almost all have been of opinion that a great deal was known; but all this supposed knowledge in the traditional systems must be swept away, and a new beginning must be made, which we shall esteem fortunate indeed if it can attain results comparable to Galileo's law of falling bodies.

By the practice of methodological doubt, if it is genuine and prolonged, a certain humility as to our knowledge is induced: we become glad to know _anything_ in philosophy, however seemingly trivial. Philosophy has suffered from the lack of this kind of modesty. It has made the mistake of attacking the interesting problems at once, instead of proceeding patiently and slowly, accumulating whatever solid knowledge was obtainable, and trusting the great problems to the future. Men of science are not ashamed of what is intrinsically trivial, if its consequences are likely to be important; the _immediate_ outcome of an experiment is hardly ever interesting on its own account. So in philosophy, it is often desirable to expend time and care on matters which, judged alone, might seem frivolous, for it is often only through the consideration of such matters that the greater problems can be approached.

When our problem has been selected, and the necessary mental discipline has been acquired, the method to be pursued is fairly uniform. The big problems which provoke philosophical inquiry are found, on examination, to be complex, and to depend upon a number of component problems, usually more abstract than those of which they are the components. It will generally be found that all our initial data, all the facts that we seem to know to begin with, suffer from vagueness, confusion, and complexity. Current philosophical ideas share these defects; it is therefore necessary to create an apparatus of precise conceptions as general and as free from complexity as possible, before the data can be analysed into the kind of premisses which philosophy aims at discovering. In this process of analysis, the source of difficulty is tracked further and further back, growing at each stage more abstract, more refined, more difficult to apprehend. Usually it will be found that a number of these extraordinarily abstract questions underlie any one of the big obvious problems. When everything has been done that can be done by method, a stage is reached where only direct philosophic vision can carry matters further. Here only genius will avail. What is wanted, as a rule, is some new effort of logical imagination, some glimpse of a possibility never conceived before, and then the direct perception that this possibility is realised in the case in question. Failure to think of the right possibility leaves insoluble difficulties, balanced arguments pro and con,

utter bewilderment and despair. But the right possibility, as a rule, when once conceived, justifies itself swiftly by its astonishing power of absorbing apparently conflicting facts. From this point onward, the work of the philosopher is synthetic and comparatively easy; it is in the very last stage of the analysis that the real difficulty consists.

Of the prospect of progress in philosophy, it would be rash to speak with confidence. Many of the traditional problems of philosophy, perhaps most of those which have interested a wider circle than that of technical students, do not appear to be soluble by scientific methods. Just as astronomy lost much of its human interest when it ceased to be astrology, so philosophy must lose in attractiveness as it grows less prodigal of promises. But to the large and still growing body of men engaged in the pursuit of science--men who hitherto, not without justification, have turned aside from philosophy with a certain contempt--the new method, successful already in such time-honoured problems as number, infinity, continuity, space and time, should make an appeal which the older methods have wholly failed to make. Physics, with its principle of relativity and its revolutionary investigations into the nature of matter, is feeling the need for that kind of novelty in fundamental hypotheses which scientific philosophy aims at facilitating. The one and only condition, I believe, which is necessary in order to secure for philosophy in the near future an achievement surpassing all that has hitherto been accomplished by philosophers, is the creation of a school of men with scientific training and philosophical interests, unhampered by the traditions of the past, and not misled by the literary methods of those who copy the ancients in all except their merits.

CONTENTS

AUTHOR'S PREFACE

OF THE FIRST AND LAST THINGS

HISTORY OF THE MORAL FEELINGS

THE RELIGIOUS LIFE

PREFACE.

1

It is often enough, and always with great surprise, intimated to me that there is something both ordinary and unusual in all my writings, from the "Birth of Tragedy" to the recently published "Prelude to a Philosophy of the Future": they all contain, I have been told, snares and nets for short sighted birds, and something that is almost a constant, subtle, incitement to an overturning of habitual opinions and of approved customs. What!? Everything is merely--human--all too human? With this exclamation my writings are gone through, not without a certain dread and mistrust of ethic itself and not without a disposition to ask the exponent of evil things if those things be not simply misrepresented. My writings have been termed a school of distrust, still more of disdain: also, and more happily, of courage, audacity even. And in fact, I myself do not believe that anybody ever looked into the world with a distrust as deep as mine, seeming, as I do, not simply the timely advocate of the devil, but, to employ theological terms, an enemy and challenger of God; and whosoever has experienced any of the consequences of such deep distrust, anything of the chills and the agonies of isolation to which such an unqualified difference of standpoint condemns him endowed with it, will also understand how often I must have sought relief and self-forgetfulness from any source--through any object of veneration or enmity, of scientific seriousness or wanton lightness; also why I, when I could not find what I was in need of, had to fashion it for myself, counterfeiting it or imagining it (and what poet or writer has ever done anything else, and what other purpose can all the art in the world possibly have?) That which I always stood most in need of in order to effect my cure and self-recovery was faith, faith enough not to be thus isolated, not to look at life from so singular a point of view--a magic apprehension (in eye and mind) of relationship and equality, a calm confidence in friendship, a blindness, free from suspicion and questioning, to two sidedness; a pleasure in externals, superficialities, the near, the accessible, in all things possessed of color, skin and seeming. Perhaps I could be fairly reproached with much "art" in this regard, many fine counterfeitings; for example, that, wisely or wilfully, I had shut my eyes to Schopenhauer's blind will towards ethic, at a time when I was already clear sighted enough on the subject of ethic; likewise that I had deceived myself concerning Richard Wagner's incurable romanticism, as if it were a beginning and not an end; likewise concerning the

Greeks, likewise concerning the Germans and their future--and there may be, perhaps, a long list of such likewises. Granted, however, that all this were true, and with justice urged against me, what does it signify, what can it signify in regard to how much of the self-sustaining capacity, how much of reason and higher protection are embraced in such self-deception?--and how much more falsity is still necessary to me that I may therewith always reassure myself regarding the luxury of my truth. Enough, I still live; and life is not considered now apart from ethic; it _will_ [have] deception; it thrives (lebt) on deception ... but am I not beginning to do all over again what I have always done, I, the old immoralist, and bird snarer--talk unmorally, ultramorally, "beyond good and evil"?

2

Thus, then, have I evolved for myself the "free spirits" to whom this discouraging-encouraging work, under the general title "Human, All Too Human," is dedicated. Such "free spirits" do not really exist and never did exist. But I stood in need of them, as I have pointed out, in order that some good might be mixed with my evils (illness, loneliness, strangeness, _acedia_, incapacity): to serve as gay spirits and comrades, with whom one may talk and laugh when one is disposed to talk and laugh, and whom one may send to the devil when they grow wearisome. They are some compensation for the lack of friends. That such free spirits can possibly exist, that our Europe will yet number among her sons of to-morrow or of the day after to-morrow, such a brilliant and enthusiastic company, alive and palpable and not merely, as in my case, fantasms and imaginary shades, I, myself, can by no means doubt. I see them already coming, slowly, slowly. May it not be that I am doing a little something to expedite their coming when I describe in advance the influences under which I see them evolving and the ways along which they travel?

3

It may be conjectured that a soul in which the type of "free spirit" can attain maturity and completeness had its decisive and deciding event in the form of a great emancipation or unbinding, and that prior to that event it seemed only the more firmly and forever chained to its place and pillar. What binds strongest? What cords seem almost unbreakable? In the case of mortals of a choice and lofty nature they will be those of duty: that reverence, which in youth is most typical, that timidity and tenderness in the presence of the traditionally honored and the worthy, that gratitude to the soil from which we sprung, for the hand that guided us, for the relic before which we were taught to pray--their sublimest moments will themselves bind these souls most strongly. The great liberation comes suddenly to such prisoners, like an earthquake: the young soul is all at once shaken, torn apart, cast forth--it comprehends not itself what is taking place. An involuntary onward impulse rules them with the mastery of command; a will, a wish are developed to go forward, anywhere, at any price; a strong, dangerous curiosity regarding an undiscovered world flames and flashes in all their being. "Better to die than live _here_"--so sounds the tempting voice: and this "here," this "at home" constitutes all they have hitherto loved. A sudden dread and distrust of that which they loved, a flash of contempt for that which is called their "duty," a mutinous, wilful, volcanic-like longing for a far away journey, strange scenes and people, annihilation, petrifaction, a hatred surmounting love, perhaps a sacrilegious impulse and look backwards, to where they so long prayed and loved, perhaps a flush of shame for what they did and at the same time an exultation at having done it, an inner, intoxicating, delightful tremor in which is betrayed the sense of victory--a victory? over what? over whom? a riddle-like victory, fruitful in questioning and well worth questioning, but the _first_ victory, for all--such things of pain and ill belong to the history of the great liberation. And it is at the same time a malady that can destroy a man, this first outbreak of strength and will for self-destination, self-valuation, this will for free will: and how much illness is forced to the surface in the frantic strivings and singularities with which the freedman, the liberated seeks henceforth to attest his mastery over things! He roves fiercely around, with an unsatisfied longing and whatever objects he may encounter must suffer from the perilous expectancy of his pride; he tears to pieces whatever attracts him. With a sardonic laugh he overturns whatever he finds veiled or protected by any reverential awe: he would see what these things look like when they are overturned. It is wilfulness and delight in the wilfulness of it, if he now, perhaps, gives his approval to that which has heretofore been in ill repute--if, in curiosity and experiment, he penetrates stealthily to the most forbidden things. In the background during all his plunging and roaming--for he is as restless and aimless in his course as if lost in a wilderness--is the interrogation mark of a curiosity growing ever more dangerous. "Can we not upset every standard? and is good perhaps evil? and God only an invention and a subtlety of the devil? Is everything, in the last resort, false? And if we are dupes are we not on that very account dupers also? _must_ we not be dupers also?" Such reflections lead and mislead him, ever further on, ever further away. Solitude, that dread goddess and mater saeva cupidinum, encircles and besets him, ever more threatening, more violent, more heart breaking--but who to-day knows what solitude is?

4

From this morbid solitude, from the deserts of such trial years, the way is yet far to that great, overflowing certainty and healthiness which cannot dispense even with sickness as a means and a grappling hook of knowledge; to that matured freedom of the spirit which is, in an equal degree, self mastery and discipline of the heart, and gives access to the path of much and various reflection--to that inner comprehensiveness and self satisfaction of over-richness which precludes all danger that the spirit has gone astray even in its own path and is sitting intoxicated in some corner or other; to that overplus of plastic, healing, imitative and restorative power which is the very sign of vigorous health, that overplus which confers upon the free spirit the perilous prerogative of spending a life in experiment and of running adventurous risks: the past-master-privilege of the free spirit. In the interval there may be long years of convalescence, years filled with many hued painfully-bewitching transformations, dominated and led to the goal by a tenacious will for health that is often emboldened to assume the guise and the disguise of health. There is a middle ground to this, which a man of such destiny can not subsequently recall without emotion; he basks in a special fine sun of his own, with a feeling of birdlike freedom, birdlike visual power, birdlike irrepressibleness, a something extraneous (Drittes) in which curiosity and delicate disdain have united. A "free spirit"--this refreshing term is grateful in any mood, it almost sets one aglow. One lives--no longer in the bonds of love and hate, without a yes or no, here or there indifferently, best pleased to evade, to avoid, to beat about, neither advancing nor retreating. One is habituated to the bad, like a person who all at once sees a fearful hurly-burly _beneath_ him--and one was the counterpart of him who bothers himself with things that do not concern him. As a matter of fact the free spirit is bothered with mere things--and how many things--which no longer _concern_ him.

5

A step further in recovery: and the free spirit draws near to life again, slowly indeed, almost refractorily, almost distrustfully. There is again warmth and mellowness: feeling and fellow feeling acquire depth, lambent airs stir all about him. He almost feels: it seems as if now for the first time his eyes are open to things _near_. He is in amaze and sits hushed: for where had he been? These near and immediate things: how changed they seem to him! He looks gratefully back--grateful for his wandering, his self exile and severity, his lookings afar and his bird flights in the cold heights. How fortunate that he has not, like a sensitive, dull home body, remained always "in the house" and "at home!" He had been beside himself, beyond a doubt. Now for the first time he really sees himself--and what surprises in the process. What hitherto unfelt tremors! Yet what joy in the exhaustion, the old sickness, the relapses of the convalescent! How it delights him, suffering, to sit still, to exercise patience, to lie in the sun! Who so well as he appreciates the fact that there comes balmy weather even in winter, who delights more in the sunshine athwart the wall? They are the most appreciative creatures in the world, and also the most humble, these convalescents and lizards, crawling back towards life: there are some among them who can let no day slip past them without addressing some song of praise to its retreating light. And speaking seriously, it is a fundamental cure for all pessimism (the cankerous vice, as is well known, of all idealists and humbugs), to become ill in the manner of these free spirits, to remain ill quite a while and then bit by bit grow healthy--I mean healthier. It is wisdom, worldly wisdom, to administer even health to oneself for a long time in small doses.

6

About this time it becomes at last possible, amid the flash lights of a still unestablished, still precarious health, for the free, the ever freer spirit to begin to read the riddle of that great liberation, a riddle which has hitherto lingered, obscure, well worth questioning, almost impalpable, in his memory. If once he hardly dared to ask "why so apart? so alone? renouncing all I loved? renouncing respect itself? why this coldness, this suspicion, this hate for one's very virtues?"--now he dares, and asks it loudly, already hearing the answer, "you had to become master over yourself, master of your own good qualities. Formerly they were your masters: but they should be merely your tools along with other tools. You had to acquire power over your aye and no and learn to hold and withhold them in accordance with your higher aims. You had to grasp the perspective of every representation (Werthschaetzung)--the dislocation, distortion and the apparent end or teleology of the horizon, besides whatever else appertains to the perspective: also the element of demerit in its relation to opposing merit, and the whole intellectual cost of every affirmative, every negative. You had to find out the _inevitable_ error[1] in every Yes and in every No, error as inseparable from life, life itself as conditioned by the perspective and its inaccuracy.[1] Above all, you had to see with your own eyes where the error[1] is always greatest: there, namely, where life is littlest, narrowest, meanest, least developed and yet cannot help looking upon itself as the goal and standard of things, and smugly and ignobly and incessantly tearing to tatters all that is highest and greatest and richest, and putting the shreds into the form of questions from the standpoint of its own well being. You had to see with your own eyes the problem of classification, (Rangordnung, regulation concerning rank and station) and how strength and sweep and reach of perspective wax upward together: You had"--enough, the free spirit knows henceforward which "you had" it has obeyed and also what it now can do and what it now, for the first time, _dare_.

[1] Ungerechtigkeit, literally wrongfulness, injustice, unrighteousness.

7

Accordingly, the free spirit works out for itself an answer to that riddle of its liberation and concludes by generalizing upon its experience in the following fashion: "What I went through everyone must go through" in whom any problem is germinated and strives to body itself forth. The inner power and inevitability of this problem will assert themselves in due course, as in the case of any unsuspected pregnancy--long before the spirit has seen this problem in its true aspect and learned to call it by its right name. Our destiny exercises its influence over us even when, as yet, we have not learned its nature: it is our future that lays down the law to our to-day. Granted, that it is the problem of classification[2] of which we free spirits may say, this is _our_ problem, yet it is only now, in the midday of our life, that we fully appreciate what preparations, shifts, trials, ordeals, stages, were essential to that problem before it could emerge to our view, and why we had to go through the various and contradictory longings and satisfactions of body and soul, as circumnavigators and adventurers of that inner world called "man"; as surveyors of that "higher" and of that "progression"[3] that is also called "man"--crowding in everywhere, almost without fear, disdaining nothing, missing nothing, testing everything, sifting everything and eliminating the chance impurities--until at last we could say, we free spirits: "Here--a _new_ problem! Here, a long ladder on the rungs of which we ourselves have rested and risen, which we have actually been at times. Here is a something higher, a something deeper, a something below us, a vastly extensive order, (Ordnung) a comparative classification (Rangordnung), that we perceive: here--_our_ problem!"

[2] Rangordnung: the meaning is "the problem of grasping the relative importance of things."

[3] Uebereinander: one over another.

8

To what stage in the development just outlined the present book belongs (or is assigned) is something that will be hidden from no augur or psychologist for an instant. But where are there psychologists to-day? In France, certainly; in Russia, perhaps; certainly not in Germany. Grounds are not wanting, to be sure, upon which the Germans of to-day may adduce this fact to their credit: unhappily for one who in this matter is fashioned and mentored in an un-German school! This _German_ book, which has found its readers in a wide circle of lands and peoples--it has been some ten years on its rounds--and which must make its way by means of any musical art and tune that will captivate the foreign ear as well as the native--this book has been read most indifferently in Germany itself and little heeded there: to what is that due? "It requires too much," I have been told, "it addresses itself to men free from the press of petty obligations, it demands fine and trained perceptions, it requires a surplus, a surplus of time, of the lightness of heaven and of the heart, of otium in the most unrestricted sense: mere good things that we Germans of to-day have not got and therefore cannot give." After so graceful a retort, my philosophy bids me be silent and ask no more questions: at times, as the proverb says, one remains a philosopher only because one says--nothing!

Nice, Spring, 1886.

OF THE FIRST AND LAST THINGS.

1

=Chemistry of the Notions and the Feelings.=--Philosophical problems, in almost all their aspects, present themselves in the same interrogative formula now that they did two thousand years ago: how can a thing develop out of its antithesis? for example, the reasonable from the non-reasonable, the animate from the inanimate, the logical from the illogical, altruism from egoism, disinterestedness from greed, truth from error? The metaphysical philosophy formerly steered itself clear of this difficulty to such extent as to repudiate the evolution of one thing from another and to assign a miraculous origin to what it deemed highest and best, due to the very nature and being of the "thing-in-itself." The historical philosophy, on the other hand, which can no longer be viewed apart from physical science, the youngest of all philosophical methods, discovered experimentally (and its results will probably always be the same) that there is no antithesis whatever, except in the usual exaggerations of popular or metaphysical comprehension, and that an error of the reason is at the bottom of such contradiction. According to its explanation, there is, strictly speaking, neither unselfish conduct, nor a wholly disinterested point of view. Both are simply sublimations in which the basic element seems almost evaporated and betrays its presence only to the keenest observation. All that we need and that could

possibly be given us in the present state of development of the sciences, is a chemistry of the moral, religious, aesthetic conceptions and feeling, as well as of those emotions which we experience in the affairs, great and small, of society and civilization, and which we are sensible of even in solitude. But what if this chemistry established the fact that, even in _its_ domain, the most magnificent results were attained with the basest and most despised ingredients? Would many feel disposed to continue such investigations? Mankind loves to put by the questions of its origin and beginning: must one not be almost inhuman in order to follow the opposite course?

2

=The Traditional Error of Philosophers.=--All philosophers make the common mistake of taking contemporary man as their starting point and of trying, through an analysis of him, to reach a conclusion. "Man" involuntarily presents himself to them as an aeterna veritas as a passive element in every hurly-burly, as a fixed standard of things. Yet everything uttered by the philosopher on the subject of man is, in the last resort, nothing more than a piece of testimony concerning man during a very limited period of time. Lack of the historical sense is the traditional defect in all philosophers. Many innocently take man in his most childish state as fashioned through the influence of certain religious and even of certain political developments, as the permanent form under which man must be viewed. They will not learn that man has evolved,[4] that the intellectual faculty itself is an evolution, whereas some philosophers make the whole cosmos out of this intellectual faculty. But everything essential in human evolution took place aeons ago, long before the four thousand years or so of which we know anything: during these man may not have changed very much. However, the philosopher ascribes "instinct" to contemporary man and assumes that this is one of the unalterable facts regarding man himself, and hence affords a clue to the understanding of the universe in general. The whole teleology is so planned that man during the last four thousand years shall be spoken of as a being existing from all eternity, and with reference to whom everything in the cosmos from its very inception is naturally ordered. Yet everything evolved: there are no eternal facts as there are no absolute truths. Accordingly, historical philosophising is henceforth indispensable, and with it honesty of judgment.

[4] geworden.

3

=Appreciation of Simple Truths.=--It is the characteristic of an advanced civilization to set a higher value upon little, simple truths, ascertained by scientific method, than upon the pleasing and magnificent errors originating in metaphysical and aesthetical epochs and peoples. To begin with, the former are spoken of with contempt as if there could be no question of comparison respecting them, so rigid, homely, prosaic and even discouraging is the aspect of the first, while so beautiful, decorative, intoxicating and perhaps beatific appear the last named. Nevertheless, the hardwon, the certain, the lasting and, therefore, the fertile in new knowledge, is the higher; to hold fast to it is manly and evinces courage, directness, endurance. And not only individual men but all mankind will by degrees be uplifted to this manliness when they are finally habituated to the proper appreciation of tenable, enduring knowledge and have lost all faith in inspiration and in the miraculous revelation of truth. The reverers of forms, indeed, with their standards of beauty and taste, may have good reason to laugh when the appreciation of little truths and the scientific spirit begin to prevail, but that will be only because their eyes are not yet opened to the charm of the utmost simplicity of form or because men though reared in the rightly appreciative spirit, will still not be fully permeated by it, so that they continue unwittingly imitating ancient forms (and that ill enough, as anybody does who no longer feels any interest in a thing). Formerly the mind was not brought into play through the medium of exact thought. Its serious business lay in the working out of forms and symbols. That has now changed. Any seriousness in symbolism is at present the indication of a deficient education. As our very acts become more intellectual, our tendencies more rational, and our judgment, for example, as to what seems reasonable, is very different from what it was a hundred years ago: so the forms of our lives grow ever more intellectual and, to the old fashioned eye, perhaps, uglier, but only because it cannot see that the richness of inner, rational beauty always spreads and deepens, and that the inner, rational aspect of all things should now be of more consequence to us than the most beautiful externality and the most exquisite limning.

4

=Astrology and the Like.=--It is presumable that the objects of the religious, moral, aesthetic and logical notions pertain simply to the superficialities of things, although man flatters himself with the thought that here at least he is getting to the heart of the cosmos. He deceives himself because these things have power to make him so happy and so wretched, and so he evinces, in this respect, the same conceit that characterises astrology. Astrology presupposes that the heavenly bodies are regulated in their movements in harmony with the destiny of mortals: the moral man presupposes that that which concerns himself most nearly must also be the

heart and soul of things.

5

=Misconception of Dreams.=--In the dream, mankind, in epochs of crude primitive civilization, thought they were introduced to a second, substantial world: here we have the source of all metaphysic. Without the dream, men would never have been incited to an analysis of the world. Even the distinction between soul and body is wholly due to the primitive conception of the dream, as also the hypothesis of the embodied soul, whence the development of all superstition, and also, probably, the belief in god. "The dead still live: for they appear to the living in dreams." So reasoned mankind at one time, and through many thousands of years.

6

=The Scientific Spirit Prevails only Partially, not Wholly.=--The specialized, minutest departments of science are dealt with purely objectively. But the general universal sciences, considered as a great, basic unity, posit the question--truly a very living question--: to what purpose? what is the use? Because of this reference to utility they are, as a whole, less impersonal than when looked at in their specialized aspects. Now in the case of philosophy, as forming the apex of the scientific pyramid, this question of the utility of knowledge is necessarily brought very conspicuously forward, so that every philosophy has, unconsciously, the air of ascribing the highest utility to itself. It is for this reason that all philosophies contain such a great amount of high flying metaphysic, and such a shrinking from the seeming insignificance of the deliverances of physical science: for the significance of knowledge in relation to life must be made to appear as great as possible. This constitutes the antagonism between the specialties of science and philosophy. The latter aims, as art aims, at imparting to life and conduct the utmost depth and significance: in the former mere knowledge is sought and nothing else--whatever else be incidentally obtained. Heretofore there has never been a philosophical system in which philosophy itself was not made the apologist of knowledge [in the abstract]. On this point, at least, each is optimistic and insists that to knowledge the highest utility must be ascribed. They are all under the tyranny of logic, which is, from its very nature, optimism.

7

=The Discordant Element in Science.=--Philosophy severed itself from science when it put the question: what is that knowledge of the world and of life through which mankind may be made happiest? This happened when the Socratic school arose: with the standpoint of _happiness_ the arteries of investigating science were compressed too tightly to permit of any circulation of the blood--and are so compressed to-day.

8

=Pneumatic Explanation of Nature.=[5]--Metaphysic reads the message of nature as if it were written purely pneumatically, as the church and its learned ones formerly did where the bible was concerned. It requires a great deal of expertness to apply to nature the same strict science of interpretation that the philologists have devised for all literature, and to apply it for the purpose of a simple, direct interpretation of the message, and at the same time, not bring out a double meaning. But, as in the case of books and literature, errors of exposition are far from being completely eliminated, and vestiges of allegorical and mystical interpretations are still to be met with in the most cultivated circles, so where nature is concerned the case is--actually much worse.

[5] Pneumatic is here used in the sense of spiritual. Pneuma being the Greek word in the New Testament for the Holy Spirit.--Ed.

9

=Metaphysical World.=--It is true, there may be a metaphysical world; the absolute possibility of it can scarcely be disputed. We see all things through the medium of the human head and we cannot well cut off this head: although there remains the question what part of the world would be left after it had been cut off. But that is a purely abstract scientific problem and one not much calculated to give men uneasiness: yet everything that has heretofore made metaphysical assumptions valuable, fearful or delightful to men, all that gave rise to them is passion, error and self deception: the worst systems of knowledge, not the best, pin their tenets of belief thereto. When such methods are once brought to view as the basis of all existing religions and metaphysics, they are already discredited. There always remains, however, the possibility already conceded: but nothing at all can be made out of that, to say not a word about letting happiness, salvation and life hang upon the threads spun from such a possibility. Accordingly, nothing could be predicated of the metaphysical world beyond the fact that it is an elsewhere,[6] another sphere, inaccessible and incomprehensible to us: it would become a thing of negative properties. Even were the existence of such a world absolutely established, it would

nevertheless remain incontrovertible that of all kinds of knowledge, knowledge of such a world would be of least consequence--of even less consequence than knowledge of the chemical analysis of water would be to a storm tossed mariner.

[6] Anderssein.

10

=The Harmlessness of Metaphysic in the Future.=--As soon as religion, art and ethics are so understood that a full comprehension of them can be gained without taking refuge in the postulates of metaphysical claptrap at any point in the line of reasoning, there will be a complete cessation of interest in the purely theoretical problem of the "thing in itself" and the "phenomenon." For here, too, the same truth applies: in religion, art and ethics we are not concerned with the "essence of the cosmos".[7] We are in the sphere of pure conception. No presentiment [or intuition] can carry us any further. With perfect tranquility the question of how our conception of the world could differ so sharply from the actual world as it is manifest to us, will be relegated to the physiological sciences and to the history of the evolution of ideas and organisms.

[7] "Wesen der Welt an sich."

11

=Language as a Presumptive Science.=--The importance of language in the development of civilization consists in the fact that by means of it man placed one world, his own, alongside another, a place of leverage that he thought so firm as to admit of his turning the rest of the cosmos on a pivot that he might master it. In so far as man for ages looked upon mere ideas and names of things as upon aeternae veritates, he evinced the very pride with which he raised himself above the brute. He really supposed that in language he possessed a knowledge of the cosmos. The language builder was not so modest as to believe that he was only giving names to things. On the contrary he thought he embodied the highest wisdom concerning things in [mere] words; and, in truth, language is the first movement in all strivings for wisdom. Here, too, it is _faith in ascertained truth_[8] from which the mightiest fountains of strength have flowed. Very tardily--only now--it dawns upon men that they have propagated a monstrous error in their belief in language. Fortunately, it is too late now to arrest and turn back the evolutionary process of the reason, which had its inception in this belief. Logic itself rests upon assumptions to which nothing in the world of reality corresponds. For example, the correspondence of certain things to one another and the identity of those things at different periods of time are assumptions pure and simple, but the science of logic originated in the positive belief that they were not assumptions at all but established facts. It is the same with the science of mathematics which certainly would never have come into existence if mankind had known from the beginning that in all nature there is no perfectly straight line, no true circle, no standard of measurement.

[8] Glaube an die gefundene Wahrheit, as distinguished from faith in what is taken on trust as truth.

12

=Dream and Civilization.=--The function of the brain which is most encroached upon in slumber is the memory; not that it is wholly suspended, but it is reduced to a state of imperfection as, in primitive ages of mankind, was probably the case with everyone, whether waking or sleeping. Uncontrolled and entangled as it is, it perpetually confuses things as a result of the most trifling similarities, yet in the same mental confusion and lack of control the nations invented their mythologies, while nowadays travelers habitually observe how prone the savage is to forgetfulness, how his mind, after the least exertion of memory, begins to wander and lose itself until finally he utters falsehood and nonsense from sheer exhaustion. Yet, in dreams, we all resemble this savage. Inadequacy of distinction and error of comparison are the basis of the preposterous things we do and say in dreams, so that when we clearly recall a dream we are startled that so much idiocy lurks within us. The absolute distinctness of all dream-images, due to implicit faith in their substantial reality, recalls the conditions in which earlier mankind were placed, for whom hallucinations had extraordinary vividness, entire communities and even entire nations laboring simultaneously under them. Therefore: in sleep and in dream we make the pilgrimage of early mankind over again.

13

=Logic of the Dream.=--During sleep the nervous system, through various inner provocatives, is in constant agitation. Almost all the organs act independently and vigorously. The blood circulates rapidly. The posture of the sleeper compresses some portions of the body. The coverlets influence the sensations in different ways. The stomach carries on the digestive process and acts upon other

organs thereby. The intestines are in motion. The position of the head induces unaccustomed action. The feet, shoeless, no longer pressing the ground, are the occasion of other sensations of novelty, as is, indeed, the changed garb of the entire body. All these things, following the bustle and change of the day, result, through their novelty, in a movement throughout the entire system that extends even to the brain functions. Thus there are a hundred circumstances to induce perplexity in the mind, a questioning as to the cause of this excitation. Now, the dream is a _seeking and presenting of reasons_ for these excitations of feeling, of the supposed reasons, that is to say. Thus, for example, whoever has his feet bound with two threads will probably dream that a pair of serpents are coiled about his feet. This is at first a hypothesis, then a belief with an accompanying imaginative picture and the argument: "these snakes must be the _causa_ of those sensations which I, the sleeper, now have." So reasons the mind of the sleeper. The conditions precedent, as thus conjectured, become, owing to the excitation of the fancy, present realities. Everyone knows from experience how a dreamer will transform one piercing sound, for example, that of a bell, into another of quite a different nature, say, the report of cannon. In his dream he becomes aware first of the effects, which he explains by a subsequent hypothesis and becomes persuaded of the purely conjectural nature of the sound. But how comes it that the mind of the dreamer goes so far astray when the same mind, awake, is habitually cautious, careful, and so conservative in its dealings with hypotheses? why does the first plausible hypothesis of the cause of a sensation gain credit in the dreaming state? (For in a dream we look upon that dream as reality, that is, we accept our hypotheses as fully established). I have no doubt that as men argue in their dreams to-day, mankind argued, even in their waking moments, for thousands of years: the first _causa_, that occurred to the mind with reference to anything that stood in need of explanation, was accepted as the true explanation and served as such. (Savages show the same tendency in operation, as the reports of travelers agree). In the dream this atavistic relic of humanity manifests its existence within us, for it is the foundation upon which the higher rational faculty developed itself and still develops itself in every individual. Dreams carry us back to the earlier stages of human culture and afford us a means of understanding it more clearly. Dream thought comes so easily to us now because we are so thoroughly trained to it through the interminable stages of evolution during which this fanciful and facile form of theorising has prevailed. To a certain extent the dream is a restorative for the brain, which, during the day, is called upon to meet the many demands for trained thought made upon it by the conditions of a higher civilization.--We may, if we please, become sensible, even in our waking moments, of a condition that is as a door and vestibule to dreaming. If we close our eyes the brain immediately conjures up a medley of impressions of light and color, apparently a sort of imitation and echo of the impressions forced in upon the brain during its waking moments. And now the mind, in co-operation with the imagination, transforms this formless play of light and color into definite figures, moving groups, landscapes. What really takes place is a sort of reasoning from effect back to cause. As the brain inquires: whence these impressions of light and color? it posits as the inducing causes of such lights and colors, those shapes and figures. They serve the brain as the occasions of those lights and colors because the brain, when the eyes are open and the senses awake, is accustomed to perceiving the cause of every impression of light and color made upon it. Here again the imagination is continually interposing its images inasmuch as it participates in the production of the impressions made through the senses day by day: and the dream-fancy does exactly the same thing--that is, the presumed cause is determined from the effect and _after_ the effect: all this, too, with extraordinary rapidity, so that in this matter, as in a matter of jugglery or sleight-of-hand, a confusion of the mind is produced and an after effect is made to appear a simultaneous action, an inverted succession of events, even.--From these considerations we can see how _late_ strict, logical thought, the true notion of cause and effect must have been in developing, since our intellectual and rational faculties to this very day revert to these primitive processes of deduction, while practically half our lifetime is spent in the super-inducing conditions.--Even the poet, the artist, ascribes to his sentimental and emotional states causes which are not the true ones. To that extent he is a reminder of early mankind and can aid us in its comprehension.

14

=Association.=[9]--All strong feelings are associated with a variety of allied sentiments and emotions. They stir up the memory at the same time. When we are under their influence we are reminded of similar states and we feel a renewal of them within us. Thus are formed habitual successions of feelings and notions, which, at last, when they follow one another with lightning rapidity are no longer felt as complexities but as unities. In this sense we hear of moral feelings, of religious feelings, as if they were absolute unities. In reality they are streams with a hundred sources and tributaries. Here again, the unity of the word speaks nothing for the unity of the thing.

[9] Miterklingen: to sound simultaneously with.

15

=No Within and Without in the World.=[10]--As Democritus transferred the notions above and below to limitless space, where they are destitute of meaning, so the philosophers do generally with the idea "within and without," as regards the form and substance (Wesen und Erscheinung) of the world. What they claim is that through the medium of profound feelings one can penetrate deep into the soul of things (Innre), draw close to the heart of nature. But these feelings are deep only in so far as with them are simultaneously aroused, although almost imperceptibly, certain complicated groups of thoughts (Gedankengruppen) which we call deep: a feeling is deep because we deem the thoughts accompanying it deep. But deep thought can nevertheless be very widely sundered from truth, as for instance every metaphysical thought. Take from deep feeling the element of thought blended with it and all that remains is _strength_ of feeling which is no voucher for the validity of knowledge, as intense faith is evidence only of its own intensity and not of the truth of that in which the faith is felt.

[10] Kein Innen und Aussen in der Welt: the above translation may seem too literal but some dispute has arisen concerning the precise idea the author means to convey.

16

=Phenomenon and Thing-in-Itself.=--The philosophers are in the habit of placing themselves in front of life and experience--that which they call the world of phenomena--as if they were standing before a picture that is unrolled before them in its final completeness. This panorama, they think, must be studied in every detail in order to reach some conclusion regarding the object represented by the picture. From effect, accordingly is deduced cause and from cause is deduced the unconditioned. This process is generally looked upon as affording the all sufficient explanation of the world of phenomena. On the other hand one must, (while putting the conception of the metaphysical distinctly forward as that of the unconditioned, and consequently of the unconditioning) absolutely deny any connection between the unconditioned (of the metaphysical world) and the world known to us: so that throughout phenomena there is no manifestation of the thing-in-itself, and getting from one to the other is out of the question. Thus is left quite ignored the circumstance that the picture--that which we now call life and experience--is a gradual evolution, is, indeed, still in process of evolution and for that reason should not be regarded as an enduring whole from which any conclusion as to its author (the all-sufficient reason) could be arrived at, or even pronounced out of the question. It is because we have for thousands of years looked into the world with moral, aesthetic, religious predispositions, with blind prejudice, passion or fear, and surfeited ourselves with indulgence in the follies of illogical thought, that the world has gradually become so wondrously motley, frightful, significant, soulful: it has taken on tints, but we have been the colorists: the human intellect, upon the foundation of human needs, of human passions, has reared all these "phenomena" and injected its own erroneous fundamental conceptions into things. Late, very late, the human intellect checks itself: and now the world of experience and the thing-in-itself seem to it so severed and so antithetical that it denies the possibility of one's hinging upon the other--or else summons us to surrender our intellect, our personal will, to the secret and the awe-inspiring in order that thereby we may attain certainty of certainty hereafter. Again, there are those who have combined all the characteristic features of our world of phenomena--that is, the conception of the world which has been formed and inherited through a series of intellectual vagaries--and instead of holding the intellect responsible for it all, have pronounced the very nature of things accountable for the present very sinister aspect of the world, and preached annihilation of existence. Through all these views and opinions the toilsome, steady process of science (which now for the first time begins to celebrate its greatest triumph in the genesis of thought) will definitely work itself out, the result, being, perhaps, to the following effect: That which we now call the world is the result of a crowd of errors and fancies which gradually developed in the general evolution of organic nature, have grown together and been transmitted to us as the accumulated treasure of all the past--as the _treasure_, for whatever is worth anything in our humanity rests upon it. From this world of conception it is in the power of science to release us only to a slight extent--and this is all that could be wished--inasmuch as it cannot eradicate the influence of hereditary habits of feeling, but it can light up by degrees the stages of the development of that world of conception, and lift us, at least for a time, above the whole spectacle. Perhaps we may then perceive that the thing-in-itself is a meet subject for Homeric laughter: that it seemed so much, everything, indeed, and is really a void--void, that is to say, of meaning.

17

=Metaphysical Explanation.=--Man, when he is young, prizes metaphysical explanations, because they make him see matters of the highest import in things he found disagreeable or contemptible: and if he is not satisfied with himself, this feeling of dissatisfaction is soothed when he sees the most hidden world-problem or world-pain in that which he finds so displeasing in himself. To feel himself more unresponsible and at the same time to find things (Dinge) more interesting--that is to him the double benefit he owes to metaphysics. Later, indeed, he acquires distrust of the whole metaphysical method of explaining things: he then

perceives, perhaps, that those effects could have been attained just as well and more scientifically by another method: that physical and historical explanations would, at least, have given that feeling of freedom from personal responsibility just as well, while interest in life and its problems would be stimulated, perhaps, even more.

18

=The Fundamental Problems of Metaphysics.=--If a history of the development of thought is ever written, the following proposition, advanced by a distinguished logician, will be illuminated with a new light: "The universal, primordial law of the apprehending subject consists in the inner necessity of cognizing every object by itself, as in its essence a thing unto itself, therefore as self-existing and unchanging, in short, as a substance." Even this law, which is here called "primordial," is an evolution: it has yet to be shown how gradually this evolution takes place in lower organizations: how the dim, mole eyes of such organizations see, at first, nothing but a blank sameness: how later, when the various excitations of desire and aversion manifest themselves, various substances are gradually distinguished, but each with an attribute, that is, a special relationship to such an organization. The first step towards the logical is judgment, the essence of which, according to the best logicians, is belief. At the foundation of all beliefs lie sensations of pleasure or pain in relation to the apprehending subject. A third feeling, as the result of two prior, single, separate feelings, is judgment in its crudest form. We organic beings are primordially interested by nothing whatever in any thing (Ding) except its relation to ourselves with reference to pleasure and pain. Between the moments in which we are conscious of this relation, (the states of feeling) lie the moments of rest, of not-feeling: then the world and every thing (Ding) have no interest for us: we observe no change in them (as at present a person absorbed in something does not notice anyone passing by). To plants all things are, as a rule, at rest, eternal, every object like itself. From the period of lower organisms has been handed down to man the belief that there are like things (gleiche Dinge): only the trained experience attained through the most advanced science contradicts this postulate. The primordial belief of all organisms is, perhaps, that all the rest of the world is one thing and motionless.--Furthest away from this first step towards the logical is the notion of causation: even to-day we think that all our feelings and doings are, at bottom, acts of the free will; when the sentient individual contemplates himself he deems every feeling, every change, a something isolated, disconnected, that is to say, unqualified by any thing; it comes suddenly to the surface, independent of anything that went before or came after. We are hungry, but originally we do not know that the organism must be nourished: on the contrary that feeling seems to manifest itself without reason or purpose; it stands out by itself and seems quite independent. Therefore: the belief in the freedom of the will is a primordial error of everything organic as old as the very earliest inward prompting of the logical faculty; belief in unconditioned substances and in like things (gleiche Dinge) is also a primordial and equally ancient error of everything organic. Inasmuch as all metaphysic has concerned itself particularly with substance and with freedom of the will, it should be designated as the science that deals with the fundamental errors of mankind as if they were fundamental truths.

19

=Number.=--The invention of the laws of number has as its basis the primordial and prior-prevailing delusion that many like things exist (although in point of fact there is no such thing is a duplicate), or that, at least, there are things (but there is no "thing"). The assumption of plurality always presupposes that _something_ exists which manifests itself repeatedly, but just here is where the delusion prevails; in this very matter we feign realities, unities, that have no existence. Our feelings, notions, of space and time are false for they lead, when duly tested, to logical contradictions. In all scientific demonstrations we always unavoidably base our calculation upon some false standards [of duration or measurement] but as these standards are at least _constant_, as, for example, our notions of time and space, the results arrived at by science possess absolute accuracy and certainty in their relationship to one another: one can keep on building upon them--until is reached that final limit at which the erroneous fundamental conceptions, (the invariable breakdown) come into conflict with the results established--as, for example, in the case of the atomic theory. Here we always find ourselves obliged to give credence to a "thing" or material "substratum" that is set in motion, although, at the same time, the whole scientific programme has had as its aim the resolving of everything material into motions [themselves]: here again we distinguish with our feeling [that which does the] moving and [that which is] moved,[11] and we never get out of this circle, because the belief in things[12] has been from time immemorial rooted in our nature.--When Kant says "the intellect does not derive its laws from nature, but dictates them to her" he states the full truth as regards the _idea of nature_ which we form (nature = world, as notion, that is, as error) but which is merely the synthesis of a host of errors of the intellect. To a world not [the outcome of] our conception, the laws of number are wholly inapplicable: such laws are valid only in the world of mankind.

[11] Wir scheiden auch hier noch mit unserer Empfindung Bewegendes und Bewegtes.

[12] Glaube an Dinge.

20

=Some Backward Steps.=--One very forward step in education is taken when man emerges from his superstitious and religious ideas and fears and, for instance, no longer believes in the dear little angels or in original sin, and has stopped talking about the salvation of the soul: when he has taken this step to freedom he has, nevertheless, through the utmost exertion of his mental power, to overcome metaphysics. Then a backward movement is necessary: he must appreciate the historical justification, and to an equal extent the psychological considerations, in such a movement. He must understand that the greatest advances made by mankind have resulted from such a course and that without this very backward movement the highest achievements of man hitherto would have been impossible.--With regard to philosophical metaphysics I see ever more and more who have arrived at the negative goal (that all positive metaphysic is a delusion) but as yet very few who go a few steps backward: one should look out over the last rungs of the ladder, but not try to stand on them, that is to say. The most advanced as yet go only far enough to free themselves from metaphysic and look back at it with an air of superiority: whereas here, no less than in the hippodrome, it is necessary to turn around in order to reach the end of the course.

21

=Presumable [Nature of the] Victory of Doubt.=--Let us assume for a moment the validity of the skeptical standpoint: granted that there is no metaphysical world, and that all the metaphysical explanations of the only world we know are useless to us, how would we then contemplate men and things? [Menschen und Dinge]. This can be thought out and it is worth while doing so, even if the question whether anything metaphysical has ever been demonstrated by or through Kant and Schopenhauer, be put altogether aside. For it is, to all appearances, highly probable that men, on this point, will be, in the mass, skeptical. The question thus becomes: what sort of a notion will human society, under the influence of such a state of mind, form of itself? Perhaps the _scientific demonstration_ of any metaphysical world is now so difficult that mankind will never be free from a distrust of it. And when there is formed a feeling of distrust of metaphysics, the results are, in the mass, the same as if metaphysics were refuted altogether and _could_ no longer be believed. In both cases the historical question, with regard to an unmetaphysical disposition in mankind, remains the same.

22

=Disbelief in the "monumentum aere perennius".=[13]--A decided disadvantage, attending the termination of metaphysical modes of thought, is that the individual fixes his mind too attentively upon his own brief lifetime and feels no strong inducement to aid in the foundation of institutions capable of enduring for centuries: he wishes himself to gather the fruit from the tree that he plants and consequently he no longer plants those trees which require centuries of constant cultivation and are destined to afford shade to generation after generation in the future. For metaphysical views inspire the belief that in them is afforded the final sure foundation upon which henceforth the whole future of mankind may rest and be built up: the individual promotes his own salvation; when, for example, he builds a church or a monastery he is of opinion that he is doing something for the salvation of his immortal soul:--Can science, as well, inspire such faith in the efficacy of her results? In actual fact, science requires doubt and distrust as her surest auxiliaries; nevertheless, the sum of the irresistible (that is all the onslaughts of skepticism, all the disintegrating effects of surviving truths) can easily become so great (as, for instance, in the case of hygienic science) as to inspire the determination to build "eternal" works upon it. At present the contrast between our excitated ephemeral existence and the tranquil repose of metaphysical epochs is too great because both are as yet in too close juxtaposition. The individual man himself now goes through too many stages of inner and outer evolution for him to venture to make a plan even for his life time alone. A perfectly modern man, indeed, who wants to build himself a house feels as if he were walling himself up alive in a mausoleum.

[13] Monument more enduring than brass: Horace, Odes III:XXX.

23

=Age of Comparison.=--The less men are bound by tradition, the greater is the inner activity of motives, the greater, correspondingly, the outer restlessness, the promiscuous flow of humanity, the polyphony of strivings. Who now feels any great impulse to establish himself and his posterity in a particular place? For whom, moreover, does there exist, at present, any strong tie? As all the methods of the arts were copied from one another, so were all the methods and advancements of moral codes, of manners, of civilizations.--Such an age derives its significance from the fact that in it the various ideas, codes, manners and civilizations can be compared and experienced side by side; which was impossible at an earlier period in view of the localised

nature of the rule of every civilization, corresponding to the limitation of all artistic effects by time and place. To-day the growth of the aesthetic feeling is decided, owing to the great number of [artistic] forms which offer themselves for comparison. The majority--those that are condemned by the method of comparison--will be allowed to die out. In the same way there is to-day taking place a selection of the forms and customs of the higher morality which can result only in the extinction of the vulgar moralities. This is the age of comparison! That is its glory--but also its pain. Let us not, however shrink from this pain. Rather would we comprehend the nature of the task imposed upon us by our age as adequately as we can: posterity will bless us for doing so--a posterity that knows itself to be [developed] through and above the narrow, early race-civilizations as well as the culture-civilization of comparison, but yet looks gratefully back upon both as venerable monuments of antiquity.

24

=Possibility of Progress.=--When a master of the old civilization (den alten Cultur) vows to hold no more discussion with men who believe in progress, he is quite right. For the old civilization[14] has its greatness and its advantages behind it, and historic training forces one to acknowledge that it can never again acquire vigor: only intolerable stupidity or equally intolerable fanaticism could fail to perceive this fact. But men may consciously determine to evolve to a new civilization where formerly they evolved unconsciously and accidentally. They can now devise better conditions for the advancement of mankind, for their nourishment, training and education, they can administer the earth as an economic power, and, particularly, compare the capacities of men and select them accordingly. This new, conscious civilization is killing the other which, on the whole, has led but an unreflective animal and plant life: it is also destroying the doubt of progress itself--progress is possible. I mean: it is hasty and almost unreflective to assume that progress must _necessarily_ take place: but how can it be doubted that progress is possible? On the other hand, progress in the sense and along the lines of the old civilization is not even conceivable. If romantic fantasy employs the word progress in connection with certain aims and ends identical with those of the circumscribed primitive national civilizations, the picture presented of progress is always borrowed from the past. The idea and the image of progress thus formed are quite without originality.

[14] Cultur, culture, civilisation etc., but there is no exact English equivalent.

25

=Private Ethics and World Ethics.=--Since the extinction of the belief that a god guides the general destiny of the world and, notwithstanding all the contortions and windings of the path of mankind, leads it gloriously forward, men must shape oecumenical, world-embracing ends for themselves. The older ethics, namely Kant's, required of the individual such a course of conduct as he wishes all men to follow. This evinces much simplicity--as if any individual could determine off hand what course of conduct would conduce to the welfare of humanity, and what course of conduct is preeminently desirable! This is a theory like that of freedom of competition, which takes it for granted that the general harmony [of things] _must_ prevail of itself in accordance with some inherent law of betterment or amelioration. It may be that a later contemplation of the needs of mankind will reveal that it is by no means desirable that all men should regulate their conduct according to the same principle; it may be best, from the standpoint of certain ends yet to be attained, that men, during long periods should regulate their conduct with reference to special, and even, in certain circumstances, evil, objects. At any rate, if mankind is not to be led astray by such a universal rule of conduct, it behooves it to attain a _knowledge of the condition of culture_ that will serve as a scientific standard of comparison in connection with cosmical ends. Herein is comprised the tremendous mission of the great spirits of the next century.

26

=Reaction as Progress.=--Occasionally harsh, powerful, impetuous, yet nevertheless backward spirits, appear, who try to conjure back some past era in the history of mankind: they serve as evidence that the new tendencies which they oppose, are not yet potent enough, that there is something lacking in them: otherwise they [the tendencies] would better withstand the effects of this conjuring back process. Thus Luther's reformation shows that in his century all the impulses to freedom of the spirit were still uncertain, lacking in vigor, and immature. Science could not yet rear her head. Indeed the whole Renaissance appears but as an early spring smothered in snow. But even in the present century Schopenhauer's metaphysic shows that the scientific spirit is not yet powerful enough: for the whole mediaeval Christian world-standpoint (Weltbetrachtung) and conception of man (Mensch-Empfindung)[15] once again, notwithstanding the slowly wrought destruction of all Christian dogma, celebrated a resurrection in Schopenhauer's doctrine. There is much science in his teaching although the science does not dominate, but, instead of it, the old, trite "metaphysical necessity." It is one of the greatest and most priceless advantages of Schopenhauer's teaching that by it our feelings are temporarily forced back to those old human and cosmical standpoints to which no other path

could conduct us so easily. The gain for history and justice is very great. I believe that without Schopenhauer's aid it would be no easy matter for anyone now to do justice to Christianity and its Asiatic relatives--a thing impossible as regards the christianity that still survives. After according this great triumph to justice, after we have corrected in so essential a respect the historical point of view which the age of learning brought with it, we may begin to bear still farther onward the banner of enlightenment--a banner bearing the three names: Petrarch, Erasmus, Voltaire. We have taken a forward step out of reaction.

[15] Literally man-feeling or human outlook.

27

=A Substitute for Religion.=--It is supposed to be a recommendation for philosophy to say of it that it provides the people with a substitute for religion. And in fact, the training of the intellect does necessitate the convenient laying out of the track of thought, since the transition from religion by way of science entails a powerful, perilous leap,--something that should be advised against. With this qualification, the recommendation referred to is a just one. At the same time, it should be further explained that the needs which religion satisfies and which science must now satisfy, are not immutable. Even they can be diminished and uprooted. Think, for instance, of the christian soul-need, the sighs over one's inner corruption, the anxiety regarding salvation--all notions that arise simply out of errors of the reason and require no satisfaction at all, but annihilation. A philosophy can either so affect these needs as to appease them or else put them aside altogether, for they are acquired, circumscribed needs, based upon hypotheses which those of science explode. Here, for the purpose of affording the means of transition, for the sake of lightening the spirit overburdened with feeling, art can be employed to far better purpose, as these hypotheses receive far less support from art than from a metaphysical philosophy. Then from art it is easier to go over to a really emancipating philosophical science.

28

=Discredited Words.=--Away with the disgustingly over-used words optimism and pessimism! For the occasion for using them grows daily less; only drivelers now find them indispensably necessary. What earthly reason could anyone have for being an optimist unless he had a god to defend who _must_ have created the best of all possible worlds, since he is himself all goodness and perfection?--but what thinking man has now any need for the hypothesis that there is a god?--There is also no occasion whatever for a pessimistic confession of faith, unless one has a personal interest in denouncing the advocate of god, the theologian or the theological philosopher, and maintaining the counter proposition that evil reigns, that wretchedness is more potent than joy, that the world is a piece of botch work, that phenomenon (Erscheinung) is but the manifestation of some evil spirit. But who bothers his head about the theologians any more--except the theologians themselves? Apart from all theology and its antagonism, it is manifest that the world is neither good nor bad, (to say nothing about its being the best or the worst) and that these ideas of "good" and "bad" have significance only in relation to men, indeed, are without significance at all, in view of the sense in which they are usually employed. The contemptuous and the eulogistic point of view must, in every case, be repudiated.

29

=Intoxicated by the Perfume of Flowers.=--The ship of humanity, it is thought, acquires an ever deeper draught the more it is laden. It is believed that the more profoundly man thinks, the more exquisitely he feels, the higher the standard he sets for himself, the greater his distance from the other animals--the more he appears as a genius (Genie) among animals--the nearer he gets to the true nature of the world and to comprehension thereof: this, indeed, he really does through science, but he thinks he does it far more adequately through his religions and arts. These are, certainly, a blossoming of the world, but not, therefore, _nearer the roots of the world_ than is the stalk. One cannot learn best from it the nature of the world, although nearly everyone thinks so. _Error_ has made men so deep, sensitive and imaginative in order to bring forth such flowers as religions and arts. Pure apprehension would be unable to do that. Whoever should disclose to us the essence of the world would be undeceiving us most cruelly. Not the world as thing-in-itself but the world as idea[16] (as error) is rich in portent, deep, wonderful, carrying happiness and unhappiness in its womb. This result leads to a philosophy of world negation: which, at any rate, can be as well combined with a practical world affirmation as with its opposite.

[16] Vorstellung: this word sometimes corresponds to the English word "idea", at others to "conception" or "notion."

30

=Evil Habits in Reaching Conclusions.=--The most usual erroneous conclusions of men are these: a thing[17] exists, therefore it is right: Here from capacity to live is deduced fitness, from fitness, is deduced justification. So also: an opinion gives happiness, therefore it is the true one, its effect is good, therefore it is itself good and true. Here is predicated of the effect that it gives happiness, that it is good in the sense of utility, and there is likewise predicated of the cause that it is good, but good in the sense of logical validity. Conversely, the proposition would run: a thing[17] cannot attain success, cannot maintain itself, therefore it is evil: a belief troubles [the believer], occasions pain, therefore it is false. The free spirit, who is sensible of the defect in this method of reaching conclusions and has had to suffer its consequences, often succumbs to the temptation to come to the very opposite conclusions (which, in general, are, of course, equally erroneous): a thing cannot maintain itself: therefore it is good; a belief is troublesome, therefore it is true.

[17] Sache, thing but not in the sense of Ding. Sache is of very indefinite application (res).

31

=The Illogical is Necessary.=--Among the things which can bring a thinker to distraction is the knowledge that the illogical is necessary to mankind and that from the illogical springs much that is good. The illogical is so imbedded in the passions, in language, in art, in religion and, above all, in everything that imparts value to life that it cannot be taken away without irreparably injuring those beautiful things. Only men of the utmost simplicity can believe that the nature man knows can be changed into a purely logical nature. Yet were there steps affording approach to this goal, how utterly everything would be lost on the way! Even the most rational man needs nature again, from time to time, that is, his illogical fundamental relation (Grundstellung) to all things.

32

=Being Unjust is Essential.=--All judgments of the value of life are illogically developed and therefore unjust. The vice of the judgment consists, first, in the way in which the subject matter comes under observation, that is, very incompletely; secondly in the way in which the total is summed up; and, thirdly, in the fact that each single item in the totality of the subject matter is itself the result of defective perception, and this from absolute necessity. No practical knowledge of a man, for example, stood he never so near to us, can be complete--so that we could have a logical right to form a total estimate of him; all estimates are summary and must be so. Then the standard by which we measure, (our being) is not an immutable quantity; we have moods and variations, and yet we should know ourselves as an invariable standard before we undertake to establish the nature of the relation of any thing (Sache) to ourselves. Perhaps it will follow from all this that one should form no judgments whatever; if one could but merely _live_ without having to form estimates, without aversion and without partiality!--for everything most abhorred is closely connected with an estimate, as well as every strongest partiality. An inclination towards a thing, or from a thing, without an accompanying feeling that the beneficial is desired and the pernicious contemned, an inclination without a sort of experiential estimation of the desirability of an end, does not exist in man. We are primordially illogical and hence unjust beings _and can recognise this fact_: this is one of the greatest and most baffling discords of existence.

33

=Error Respecting Living for the Sake of Living Essential.=--Every belief in the value and worthiness of life rests upon defective thinking; it is for this reason alone possible that sympathy with the general life and suffering of mankind is so imperfectly developed in the individual. Even exceptional men, who can think beyond their own personalities, do not have this general life in view, but isolated portions of it. If one is capable of fixing his observation upon exceptional cases, I mean upon highly endowed individuals and pure souled beings, if their development is taken as the true end of world-evolution and if joy be felt in their existence, then it is possible to believe in the value of life, because in that case the rest of humanity is overlooked: hence we have here defective thinking. So, too, it is even if all mankind be taken into consideration, and one species only of impulses (the less egoistic) brought under review and those, in consideration of the other impulses, exalted: then something could still be hoped of mankind in the mass and to that extent there could exist belief in the value of life: here, again, as a result of defective thinking. Whatever attitude, thus, one may assume, one is, as a result of this attitude, an exception among mankind. Now, the great majority of mankind endure life without any great protest, and believe, to this extent, in the value of existence, but that is because each individual decides and determines alone, and never comes out of his own personality like these exceptions: everything outside of the personal has no existence for them or at the utmost is observed as but a faint shadow. Consequently the value of life for the generality of mankind consists simply in the fact that the individual attaches more importance to himself than he does to the world. The great lack of imagination from which he suffers is responsible for his inability to enter into the feelings of beings other than himself, and hence

his sympathy with their fate and suffering is of the slightest possible description. On the other hand, whosoever really _could_ sympathise, necessarily doubts the value of life; were it possible for him to sum up and to feel in himself the total consciousness of mankind, he would collapse with a malediction against existence,--for mankind is, in the mass, without a goal, and hence man cannot find, in the contemplation of his whole course, anything to serve him as a mainstay and a comfort, but rather a reason to despair. If he looks beyond the things that immediately engage him to the final aimlessness of humanity, his own conduct assumes in his eyes the character of a frittering away. To feel oneself, however, as humanity (not alone as an individual) frittered away exactly as we see the stray leaves frittered away by nature, is a feeling transcending all feeling. But who is capable of it? Only a poet, certainly: and poets always know how to console themselves.

34

=For Tranquility.=--But will not our philosophy become thus a tragedy? Will not truth prove the enemy of life, of betterment? A question seems to weigh upon our tongue and yet will not put itself into words: whether one _can_ knowingly remain in the domain of the untruthful? or, if one _must_, whether, then, death would not be preferable? For there is no longer any ought (Sollen), morality; so far as it is involved "ought," is, through our point of view, as utterly annihilated as religion. Our knowledge can permit only pleasure and pain, benefit and injury, to subsist as motives. But how can these motives be distinguished from the desire for truth? Even they rest upon error (in so far, as already stated, partiality and dislike and their very inaccurate estimates palpably modify our pleasure and our pain). The whole of human life is deeply involved in _untruth_. The individual cannot extricate it from this pit without thereby fundamentally clashing with his whole past, without finding his present motives of conduct, (as that of honor) illegitimate, and without opposing scorn and contempt to the ambitions which prompt one to have regard for the future and for one's happiness in the future. Is it true, does there, then, remain but one way of thinking, which, as a personal consequence brings in its train despair, and as a theoretical [consequence brings in its train] a philosophy of decay, disintegration, self annihilation? I believe the deciding influence, as regards the after-effect of knowledge, will be the _temperament_ of a man; I can, in addition to this after-effect just mentioned, suppose another, by means of which a much simpler life, and one freer from disturbances than the present, could be lived; so that at first the old motives of vehement passion might still have strength, owing to hereditary habit, but they would gradually grow weaker under the influence of purifying knowledge. A man would live, at last, both among men and unto himself, as in the natural state, without praise, reproach, competition, feasting one's eyes, as if it were a play, upon much that formerly inspired dread. One would be rid of the strenuous element, and would no longer feel the goad of the reflection that man is not even [as much as] nature, nor more than nature. To be sure, this requires, as already stated, a good temperament, a fortified, gentle and naturally cheerful soul, a disposition that has no need to be on its guard against its own eccentricities and sudden outbreaks and that in its utterances manifests neither sullenness nor a snarling tone--those familiar, disagreeable characteristics of old dogs and old men that have been a long time chained up. Rather must a man, from whom the ordinary bondages of life have fallen away to so great an extent, so do that he only lives on in order to grow continually in knowledge, and to learn to resign, without envy and without disappointment, much, yes nearly everything, that has value in the eyes of men. He must be content with such a free, fearless soaring above men, manners, laws and traditional estimates of things, as the most desirable of all situations. He will freely share the joy of being in such a situation, and he has, perhaps, nothing else to share--in which renunciation and self-denial really most consist. But if more is asked of him, he will, with a benevolent shake of the head, refer to his brother, the free man of fact, and will, perhaps, not dissemble a little contempt: for, as regards his "freedom," thereby hangs a tale.[18]

[18] den mit dessen "Freiheit" hat es eine eigene Bewandtniss.

HISTORY OF THE MORAL FEELINGS.

35

=Advantages of Psychological Observation.=--That reflection regarding the human, all-too-human--or as the learned jargon is: psychological observation--is among the means whereby the burden of life can be made lighter, that practice in this art affords presence of mind in difficult situations and entertainment amid a wearisome environment, aye, that maxims may be culled in the thorniest and least pleasing paths of life and invigoration thereby obtained: this much was believed, was known--in former centuries. Why was this forgotten in our own century, during which, at least in Germany, yes in Europe, poverty as regards psychological observation would have been manifest in many ways had there been anyone to whom this poverty could have manifested itself. Not only in the novel, in the romance, in philosophical standpoints--these are the works of exceptional men; still more in the state of opinion regarding public events and personages; above all in general society, which says much about men but

nothing whatever about man, there is totally lacking the art of psychological analysis and synthesis. But why is the richest and most harmless source of entertainment thus allowed to run to waste? Why is the greatest master of the psychological maxim no longer read?--for, with no exaggeration whatever be it said: the educated person in Europe who has read La Rochefoucauld and his intellectual and artistic affinities is very hard to find; still harder, the person who knows them and does not disparage them. Apparently, too, this unusual reader takes far less pleasure in them than the form adopted by these artists should afford him: for the subtlest mind cannot adequately appreciate the art of maxim-making unless it has had training in it, unless it has competed in it. Without such practical acquaintance, one is apt to look upon this making and forming as a much easier thing than it really is; one is not keenly enough alive to the felicity and the charm of success. Hence present day readers of maxims have but a moderate, tempered pleasure in them, scarcely, indeed, a true perception of their merit, so that their experiences are about the same as those of the average beholder of cameos: people who praise because they cannot appreciate, and are very ready to admire and still readier to turn away.

36

=Objection.=--Or is there a counter-proposition to the dictum that psychological observation is one of the means of consoling, lightening, charming existence? Have enough of the unpleasant effects of this art been experienced to justify the person striving for culture in turning his regard away from it? In all truth, a certain blind faith in the goodness of human nature, an implanted distaste for any disparagement of human concerns, a sort of shamefacedness at the nakedness of the soul, may be far more desirable things in the general happiness of a man, than this only occasionally advantageous quality of psychological sharpsightedness; and perhaps belief in the good, in virtuous men and actions, in a plenitude of disinterested benevolence has been more productive of good in the world of men in so far as it has made men less distrustful. If Plutarch's heroes are enthusiastically imitated and a reluctance is experienced to looking too critically into the motives of their actions, not the knowledge but the welfare of human society is promoted thereby: psychological error and above all obtuseness in regard to it, help human nature forward, whereas knowledge of the truth is more promoted by means of the stimulating strength of a hypothesis; as La Rochefoucauld in the first edition of his "Sentences and Moral Maxims" has expressed it: "What the world calls virtue is ordinarily but a phantom created by the passions, and to which we give a good name in order to do whatever we please with impunity." La Rochefoucauld and those other French masters of soul-searching (to the number of whom has lately been added a German, the author of "Psychological Observations") are like expert marksmen who again and again hit the black spot--but it is the black spot in human nature. Their art inspires amazement, but finally some spectator, inspired, not by the scientific spirit but by a humanitarian feeling, execrates an art that seems to implant in the soul a taste for belittling and impeaching mankind.

37

=Nevertheless.=--The matter therefore, as regards pro and con, stands thus: in the present state of philosophy an awakening of the moral observation is essential. The repulsive aspect of psychological dissection, with the knife and tweezers entailed by the process, can no longer be spared humanity. Such is the imperative duty of any science that investigates the origin and history of the so-called moral feelings and which, in its progress, is called upon to posit and to solve advanced social problems:--The older philosophy does not recognize the newer at all and, through paltry evasions, has always gone astray in the investigation of the origin and history of human estimates (Werthschaetzungen). With what results may now be very clearly perceived, since it has been shown by many examples, how the errors of the greatest philosophers have their origin in a false explanation of certain human actions and feelings; how upon the foundation of an erroneous analysis (for example, of the so called disinterested actions), a false ethic is reared, to support which religion and like mythological monstrosities are called in, until finally the shades of these troubled spirits collapse in physics and in the comprehensive world point of view. But if it be established that superficiality of psychological observation has heretofore set the most dangerous snares for human judgment and deduction, and will continue to do so, all the greater need is there of that steady continuance of labor that never wearies putting stone upon stone, little stone upon little stone; all the greater need is there of a courage that is not ashamed of such humble labor and that will oppose persistence, to all contempt. It is, finally, also true that countless single observations concerning the human, all-too-human, have been first made and uttered in circles accustomed, not to furnish matter for scientific knowledge, but for intellectual pleasure-seeking; and the original home atmosphere--a very seductive atmosphere--of the moral maxim has almost inextricably interpenetrated the entire species, so that the scientific man involuntarily manifests a sort of mistrust of this species and of its seriousness. But it is sufficient to point to the consequences: for already it is becoming evident that events of the most portentous nature are developing in the domain of psychological observation. What is the leading conclusion arrived at by one of the subtlest and calmest of thinkers, the author of the work "Concerning the Origin of the Moral Feelings", as a result of his thorough and incisive analysis of human

conduct? "The moral man," he says, "stands no nearer the knowable (metaphysical) world than the physical man."[19] This dictum, grown hard and cutting beneath the hammer-blow of historical knowledge, can some day, perhaps, in some future or other, serve as the axe that will be laid to the root of the "metaphysical necessities" of men--whether more to the blessing than to the banning of universal well being who can say?--but in any event a dictum fraught with the most momentous consequences, fruitful and fearful at once, and confronting the world in the two faced way characteristic of all great facts.

[19] "Der moralische Mensch, sagt er, steht der intelligiblen (metaphysischen) Welt nicht naeher, als der physische Mensch."

38

=To What Extent Useful.=--Therefore, whether psychological observation is more an advantage than a disadvantage to mankind may always remain undetermined: but there is no doubt that it is necessary, because science can no longer dispense with it. Science, however, recognizes no considerations of ultimate goals or ends any more than nature does; but as the latter duly matures things of the highest fitness for certain ends without any intention of doing it, so will true science, doing with ideas what nature does with matter,[20] promote the purposes and the welfare of humanity, (as occasion may afford, and in many ways) and attain fitness [to ends]--but likewise without having intended it.

[20] als die Nachahmung der Natur in Begriffen, literally: "as the counterfeit of nature in (regard to) ideas."

He to whom the atmospheric conditions of such a prospect are too wintry, has too little fire in him: let him look about him, and he will become sensible of maladies requiring an icy air, and of people who are so "kneaded together" out of ardor and intellect that they can scarcely find anywhere an atmosphere too cold and cutting for them. Moreover: as too serious individuals and nations stand in need of trivial relaxations; as others, too volatile and excitable require onerous, weighty ordeals to render them entirely healthy: should not we, the more intellectual men of this age, which is swept more and more by conflagrations, catch up every cooling and extinguishing appliance we can find that we may always remain as self contained, steady and calm as we are now, and thereby perhaps serve this age as its mirror and self reflector, when the occasion arises?

39

=The Fable of Discretionary Freedom.=--The history of the feelings, on the basis of which we make everyone responsible, hence, the so-called moral feelings, is traceable in the following leading phases. At first single actions are termed good or bad without any reference to their motive, but solely because of the utilitarian or prejudicial consequences they have for the community. In time, however, the origin of these designations is forgotten [but] it is imagined that action in itself, without reference to its consequences, contains the property "good" or "bad": with the same error according to which language designates the stone itself as hard[ness] the tree itself as green[ness]--for the reason, therefore, that what is a consequence is comprehended as a cause. Accordingly, the good[ness] or bad[ness] is incorporated into the motive and [any] deed by itself is regarded as morally ambiguous. A step further is taken, and the predication good or bad is no longer made of the particular motives but of the entire nature of a man, out of which motive grows as grow the plants out of the soil. Thus man is successively made responsible for his [particular] acts, then for his [course of] conduct, then for his motives and finally for his nature. Now, at last, is it discovered that this nature, even, cannot be responsible, inasmuch as it is only and wholly a necessary consequence and is synthesised out of the elements and influence of past and present things: therefore, that man is to be made responsible for nothing, neither for his nature, nor his motives, nor his [course of] conduct nor his [particular] acts. By this [process] is gained the knowledge that the history of moral estimates is the history of error, of the error of responsibility: as is whatever rests upon the error of the freedom of the will. Schopenhauer concluded just the other way, thus: since certain actions bring depression ("consciousness of guilt") in their train, there must, then, exist responsibility, for there would be no basis for this depression at hand if all man's affairs did not follow their course of necessity--as they do, indeed, according to the opinion of this philosopher, follow their course--but man himself, subject to the same necessity, would be just the man that he is--which Schopenhauer denies. From the fact of such depression Schopenhauer believes himself able to prove a freedom which man in some way must have had, not indeed in regard to his actions but in regard to his nature: freedom, therefore, to be thus and so, not to act thus and so. Out of the _esse_, the sphere of freedom and responsibility, follows, according to his opinion, the _operari_, the spheres of invariable causation, necessity and irresponsibility. This depression, indeed, is due apparently to the _operari_--in so far as it be delusive--but in truth to whatever _esse_ be the deed of a free will, the basic cause of the existence of an individual: [in order to] let man become whatever he wills to become, his [to] will (Wollen) must precede his existence.--Here, apart from the absurdity of the statement just made, there is drawn the wrong inference that the fact of the depression explains its character, the rational admissibility of it: from such a wrong inference does Schopenhauer first come

to his fantastic consequent of the so called discretionary freedom (intelligibeln Freiheit). (For the origin of this fabulous entity Plato and Kant are equally responsible). But depression after the act does not need to be rational: indeed, it is certainly not so at all, for it rests upon the erroneous assumption that the act need not necessarily have come to pass. Therefore: only because man deems himself free, but not because he is free, does he experience remorse and the stings of conscience.--Moreover, this depression is something that can be grown out of; in many men it is not present at all as a consequence of acts which inspire it in many other men. It is a very varying thing and one closely connected with the development of custom and civilization, and perhaps manifest only during a relatively brief period of the world's history.--No one is responsible for his acts, no one for his nature; to judge is tantamount to being unjust. This applies as well when the individual judges himself. The proposition is as clear as sunlight, and yet here everyone prefers to go back to darkness and untruth: for fear of the consequences.

40

=Above Animal.=--The beast in us must be wheedled: ethic is necessary, that we may not be torn to pieces. Without the errors involved in the assumptions of ethics, man would have remained an animal. Thus has he taken himself as something higher and imposed rigid laws upon himself. He feels hatred, consequently, for states approximating the animal: whence the former contempt for the slave as a not-yet-man, as a thing, is to be explained.

41

=Unalterable Character.=--That character is unalterable is not, in the strict sense, true; rather is this favorite proposition valid only to the extent that during the brief life period of a man the potent new motives can not, usually, press down hard enough to obliterate the lines imprinted by ages. Could we conceive of a man eighty thousand years old, we should have in him an absolutely alterable character; so that the maturities of successive, varying individuals would develop in him. The shortness of human life leads to many erroneous assertions concerning the qualities of man.

42

=Classification of Enjoyments and Ethic.=--The once accepted comparative classification of enjoyments, according to which an inferior, higher, highest egoism may crave one or another enjoyment, now decides as to ethical status or unethical status. A lower enjoyment (for example, sensual pleasure) preferred to a more highly esteemed one (for example, health) rates as unethical, as does welfare preferred to freedom. The comparative classification of enjoyments is not, however, alike or the same at all periods; when anyone demands satisfaction of the law, he is, from the point of view of an earlier civilization, moral, from that of the present, non-moral. "Unethical" indicates, therefore, that a man is not sufficiently sensible to the higher, finer impulses which the present civilization has brought with it, or is not sensible to them at all; it indicates backwardness, but only from the point of view of the contemporary degree of distinction.--The comparative classification of enjoyments itself is not determined according to absolute ethics; but after each new ethical adjustment, it is then decided whether conduct be ethical or the reverse.

43

=Inhuman Men as Survivals.=--Men who are now inhuman must serve us as surviving specimens of earlier civilizations. The mountain height of humanity here reveals its lower formations, which might otherwise remain hidden from view. There are surviving specimens of humanity whose brains through the vicissitudes of heredity, have escaped proper development. They show us what we all were and thus appal us; but they are as little responsible on this account as is a piece of granite for being granite. In our own brains there must be courses and windings corresponding to such characters, just as in the forms of some human organs there survive traces of fishhood. But these courses and windings are no longer the bed in which flows the stream of our feeling.

44

=Gratitude and Revenge.=--The reason the powerful man is grateful is this. His benefactor has, through his benefaction, invaded the domain of the powerful man and established himself on an equal footing: the powerful man in turn invades the domain of the benefactor and gets satisfaction through the act of gratitude. It is a mild form of revenge. By not obtaining the satisfaction of gratitude the powerful would have shown himself powerless and have ranked as such thenceforward. Hence every society of the good, that is to say, of the powerful originally, places gratitude among the first of duties.--Swift has added the dictum that man is grateful in the same degree that he is revengeful.

45

=Two-fold Historical Origin of Good and Evil.=--The notion of good and bad has a two-fold historical origin: namely, first, in the spirit of ruling races and castes. Whoever has power to requite good with good and evil with evil and actually brings requital, (that is, is grateful and revengeful) acquires the name of being good; whoever is powerless and cannot requite is called bad. A man belongs, as a good individual, to the "good" of a community, who have a feeling in common, because all the individuals are allied with one another through the requiting sentiment. A man belongs, as a bad individual, to the "bad," to a mass of subjugated, powerless men who have no feeling in common. The good are a caste, the bad are a quantity, like dust. Good and bad is, for a considerable period, tantamount to noble and servile, master and slave. On the other hand an enemy is not looked upon as bad: he can requite. The Trojan and the Greek are in Homer both good. Not he, who does no harm, but he who is despised, is deemed bad. In the community of the good individuals [the quality of] good[ness] is inherited; it is impossible for a bad individual to grow from such a rich soil. If, notwithstanding, one of the good individuals does something unworthy of his goodness, recourse is had to exorcism; thus the guilt is ascribed to a deity, the while it is declared that this deity bewitched the good man into madness and blindness.--Second, in the spirit of the subjugated, the powerless. Here every other man is, to the individual, hostile, inconsiderate, greedy, inhuman, avaricious, be he noble or servile; bad is the characteristic term for man, for every living being, indeed, that is recognized at all, even for a god: human, divine, these notions are tantamount to devilish, bad. Manifestations of goodness, sympathy, helpfulness, are regarded with anxiety as trickiness, preludes to an evil end, deception, subtlety, in short, as refined badness. With such a predisposition in individuals, a feeling in common can scarcely arise at all, at most only the rudest form of it: so that everywhere that this conception of good and evil prevails, the destruction of the individuals, their race and nation, is imminent.--Our existing morality has developed upon the foundation laid by ruling races and castes.

46

=Sympathy Greater than Suffering.=--There are circumstances in which sympathy is stronger than the suffering itself. We feel more pain, for instance, when one of our friends becomes guilty of a reprehensible action than if we had done the deed ourselves. We once, that is, had more faith in the purity of his character than he had himself. Hence our love for him, (apparently because of this very faith) is stronger than is his own love for himself. If, indeed, his egoism really suffers more, as a result, than our egoism, inasmuch as he must take the consequences of his fault to a greater extent than ourselves, nevertheless, the unegoistic--this word is not to be taken too strictly, but simply as a modified form of expression--in us is more affected by his guilt than the unegoistic in him.

47

=Hypochondria.=--There are people who, from sympathy and anxiety for others become hypochondriacal. The resulting form of compassion is nothing else than sickness. So, also, is there a Christian hypochondria, from which those singular, religiously agitated people suffer who place always before their eyes the suffering and death of Christ.

48

=Economy of Blessings.=--The advantageous and the pleasing, as the healthiest growths and powers in the intercourse of men, are such precious treasures that it is much to be wished the use made of these balsamic means were as economical as possible: but this is impossible. Economy in the use of blessings is the dream of the craziest of Utopians.

49

=Well-Wishing.=--Among the small, but infinitely plentiful and therefore very potent things to which science must pay more attention than to the great, uncommon things, well-wishing[21] must be reckoned; I mean those manifestations of friendly disposition in intercourse, that laughter of the eye, every hand pressure, every courtesy from which, in general, every human act gets its quality. Every teacher, every functionary adds this element as a gratuity to whatever he does as a duty; it is the perpetual well spring of humanity, like the waves of light in which everything grows; thus, in the narrowest circles, within the family, life blooms and flowers only through this kind feeling. The cheerfulness, friendliness and kindness of a heart are unfailing sources of unegoistic impulse and have made far more for civilization than those other more noised manifestations of it that are styled sympathy, benevolence and sacrifice. But it is customary to depreciate these little tokens of kindly feeling, and, indeed, there is not much of the unegoistic in them. The sum of these little doses is very great, nevertheless; their combined strength is of the greatest of strengths.--Thus, too,

much more happiness is to be found in the world than gloomy eyes discover: that is, if the calculation be just, and all these pleasing moments in which every day, even the meanest human life, is rich, be not forgotten.

[21] Wohl-wollen, kind feeling. It stands here for benevolence but not benevolence in the restricted sense of the word now prevailing.

50

=The Desire to Inspire Compassion.=--La Rochefoucauld, in the most notable part of his self portraiture (first printed 1658) reaches the vital spot of truth when he warns all those endowed with reason to be on their guard against compassion, when he advises that this sentiment be left to men of the masses who stand in need of the promptings of the emotions (since they are not guided by reason) to induce them to give aid to the suffering and to be of service in misfortune: whereas compassion, in his (and Plato's) view, deprives the heart of strength. To be sure, sympathy should be manifested but men should take care not to feel it; for the unfortunate are rendered so dull that the manifestation of sympathy affords them the greatest happiness in the world.--Perhaps a more effectual warning against this compassion can be given if this need of the unfortunate be considered not simply as stupidity and intellectual weakness, not as a sort of distraction of the spirit entailed by misfortune itself (and thus, indeed, does La Rochefoucauld seem to view it) but as something quite different and more momentous. Let note be taken of children who cry and scream in order to be compassionated and who, therefore, await the moment when their condition will be observed; come into contact with the sick and the oppressed in spirit and try to ascertain if the wailing and sighing, the posturing and posing of misfortune do not have as end and aim the causing of pain to the beholder: the sympathy which each beholder manifests is a consolation to the weak and suffering only in as much as they are made to perceive that at least they have the power, notwithstanding all their weakness, to inflict pain. The unfortunate experiences a species of joy in the sense of superiority which the manifestation of sympathy entails; his imagination is exalted; he is always strong enough, then, to cause the world pain. Thus is the thirst for sympathy a thirst for self enjoyment and at the expense of one's fellow creatures: it shows man in the whole ruthlessness of his own dear self: not in his mere "dullness" as La Rochefoucauld thinks.--In social conversation three fourths of all the questions are asked, and three fourths of all the replies are made in order to inflict some little pain; that is why so many people crave social intercourse: it gives them a sense of their power. In these countless but very small doses in which the quality of badness is administered it proves a potent stimulant of life: to the same extent that well wishing--(Wohl-wollen) distributed through the world in like manner, is one of the ever ready restoratives.--But will many honorable people be found to admit that there is any pleasure in administering pain? that entertainment--and rare entertainment--is not seldom found in causing others, at least in thought, some pain, and in raking them with the small shot of wickedness? The majority are too ignoble and a few are too good to know anything of this pudendum: the latter may, consequently, be prompt to deny that Prosper Merimee is right when he says: "Know, also, that nothing is more common than to do wrong for the pleasure of doing it."

51

=How Appearance Becomes Reality.=--The actor cannot, at last, refrain, even in moments of the deepest pain, from thinking of the effect produced by his deportment and by his surroundings--for example, even at the funeral of his own child: he will weep at his own sorrow and its manifestations as though he were his own audience. The hypocrite who always plays one and the same part, finally ceases to be a hypocrite; as in the case of priests who, when young men, are always, either consciously or unconsciously, hypocrites, and finally become naturally and then really, without affectation, mere priests: or if the father does not carry it to this extent, the son, who inherits his father's calling and gets the advantage of the paternal progress, does. When anyone, during a long period, and persistently, wishes to appear something, it will at last prove difficult for him to be anything else. The calling of almost every man, even of the artist, begins with hypocrisy, with an imitation of deportment, with a copying of the effective in manner. He who always wears the mask of a friendly man must at last gain a power over friendliness of disposition, without which the expression itself of friendliness is not to be gained--and finally friendliness of disposition gains the ascendancy over him--he _is_ benevolent.

52

=The Point of Honor in Deception.=--In all great deceivers one characteristic is prominent, to which they owe their power. In the very act of deception, amid all the accompaniments, the agitation in the voice, the expression, the bearing, in the crisis of the scene, there comes over them a belief in themselves; this it is that acts so effectively and irresistibly upon the beholders. Founders of religions differ from such great deceivers in that they never come out of this state of self deception, or else they have, very rarely,

a few moments of enlightenment in which they are overcome by doubt; generally, however, they soothe themselves by ascribing such moments of enlightenment to the evil adversary. Self deception must exist that both classes of deceivers may attain far reaching results. For men believe in the truth of all that is manifestly believed with due implicitness by others.

53

=Presumed Degrees of Truth.=--One of the most usual errors of deduction is: because someone truly and openly is against us, therefore he speaks the truth. Hence the child has faith in the judgments of its elders, the Christian in the assertions of the founder of the church. So, too, it will not be admitted that all for which men sacrificed life and happiness in former centuries was nothing but delusion: perhaps it is alleged these things were degrees of truth. But what is really meant is that, if a person sincerely believes a thing and has fought and died for his faith, it would be too _unjust_ if only delusion had inspired him. Such a state of affairs seems to contradict eternal justice. For that reason the heart of a sensitive man pronounces against his head the judgment: between moral conduct and intellectual insight there must always exist an inherent connection. It is, unfortunately, otherwise: for there is no eternal justice.

54

=Falsehood.=--Why do men, as a rule, speak the truth in the ordinary affairs of life? Certainly not for the reason that a god has forbidden lying. But because first: it is more convenient, as falsehood entails invention, make-believe and recollection (wherefore Swift says that whoever invents a lie seldom realises the heavy burden he takes up: he must, namely, for every lie that he tells, insert twenty more). Therefore, because in plain ordinary relations of life it is expedient to say without circumlocution: I want this, I have done this, and the like; therefore, because the way of freedom and certainty is surer than that of ruse.--But if it happens that a child is brought up in sinister domestic circumstances, it will then indulge in falsehood as matter of course, and involuntarily say anything its own interests may prompt: an inclination for truth, an aversion to falsehood, is quite foreign and uncongenial to it, and hence it lies in all innocence.

55

=Ethic Discredited for Faith's Sake.=--No power can sustain itself when it is represented by mere humbugs: the Catholic Church may possess ever so many "worldly" sources of strength, but its true might is comprised in those still numberless priestly natures who make their lives stern and strenuous and whose looks and emaciated bodies are eloquent of night vigils, fasts, ardent prayer, perhaps even of whip lashes: these things make men tremble and cause them anxiety: what, if it be really imperative to live thus? This is the dreadful question which their aspect occasions. As they spread this doubt, they lay anew the prop of their power: even the free thinkers dare not oppose such disinterestedness with severe truth and cry: "Thou deceived one, deceive not!"--Only the difference of standpoint separates them from him: no difference in goodness or badness. But things we cannot accomplish ourselves, we are apt to criticise unfairly. Thus we are told of the cunning and perverted acts of the Jesuits, but we overlook the self mastery that each Jesuit imposes upon himself and also the fact that the easy life which the Jesuit manuals advocate is for the benefit, not of the Jesuits but the laity. Indeed, it may be questioned whether we enlightened ones would become equally competent workers as the result of similar tactics and organization, and equally worthy of admiration as the result of self mastery, indefatigable industry and devotion.

56

=Victory of Knowledge over Radical Evil.=--It proves a material gain to him who would attain knowledge to have had during a considerable period the idea that mankind is a radically bad and perverted thing: it is a false idea, as is its opposite, but it long held sway and its roots have reached down even to ourselves and our present world. In order to understand _ourselves_ we must understand _it_; but in order to attain a loftier height we must step above it. We then perceive that there is no such thing as sin in the metaphysical sense: but also, in the same sense, no such thing as virtue; that this whole domain of ethical notions is one of constant variation; that there are higher and deeper conceptions of good and evil, moral and immoral. Whoever desires no more of things than knowledge of them attains speedily to peace of mind and will at most err through lack of knowledge, but scarcely through eagerness for knowledge (or through sin, as the world calls it). He will not ask that eagerness for knowledge be interdicted and rooted out; but his single, all powerful ambition to _know_ as thoroughly and as fully as possible, will soothe him and moderate all that is strenuous in his circumstances. Moreover, he is now rid of a number of disturbing notions; he is no longer beguiled by such words as hell-pain, sinfulness, unworthiness: he sees in them merely the flitting shadow pictures of false views of life and of

the world.

57

=Ethic as Man's Self-Analysis.=--A good author, whose heart is really in his work, wishes that someone would arise and wholly refute him if only thereby his subject be wholly clarified and made plain. The maid in love wishes that she could attest the fidelity of her own passion through the faithlessness of her beloved. The soldier wishes to sacrifice his life on the field of his fatherland's victory: for in the victory of his fatherland his highest end is attained. The mother gives her child what she deprives herself of--sleep, the best nourishment and, in certain circumstances, her health, her self.--But are all these acts unegoistic? Are these moral deeds miracles because they are, in Schopenhauer's phrase "impossible and yet accomplished"? Is it not evident that in all four cases man loves one part of himself, (a thought, a longing, an experience) more than he loves another part of himself? that he thus analyses his being and sacrifices one part of it to another part? Is this essentially different from the behavior of the obstinate man who says "I would rather be shot than go a step out of my way for this fellow"?--Preference for something (wish, impulse, longing) is present in all four instances: to yield to it, with all its consequences, is not "unegoistic."--In the domain of the ethical man conducts himself not as individuum but as dividuum.

58

=What Can be Promised.=--Actions can be promised, but not feelings, for these are involuntary. Whoever promises somebody to love him always, or to hate him always, or to be ever true to him, promises something that it is out of his power to bestow. But he really can promise such courses of conduct as are the ordinary accompaniments of love, of hate, of fidelity, but which may also have their source in motives quite different: for various ways and motives lead to the same conduct. The promise to love someone always, means, consequently: as long as I love you, I will manifest the deportment of love; but if I cease to love you my deportment, although from some other motive, will be just the same, so that to the people about us it will seem as if my love remained unchanged.--Hence it is the continuance of the deportment of love that is promised in every instance in which eternal love (provided no element of self deception be involved) is sworn.

59

=Intellect and Ethic.=--One must have a good memory to be able to keep the promises one makes. One must have a strong imagination in order to feel sympathy. So closely is ethics connected with intellectual capacity.

60

=Desire for Vengeance and Vengeance Itself.=--To meditate revenge and attain it is tantamount to an attack of fever, that passes away: but to meditate revenge without possessing the strength or courage to attain it is tantamount to suffering from a chronic malady, or poisoning of body and soul. Ethics, which takes only the motive into account, rates both cases alike: people generally estimate the first case as the worst (because of the consequences which the deed of vengeance may entail). Both views are short sighted.

61

=Ability to Wait.=--Ability to wait is so hard to acquire that great poets have not disdained to make inability to wait the central motive of their poems. So Shakespeare in Othello, Sophocles in Ajax, whose suicide would not have seemed to him so imperative had he only been able to cool his ardor for a day, as the oracle foreboded: apparently he would then have repulsed somewhat the fearful whispers of distracted thought and have said to himself: Who has not already, in my situation, mistaken a sheep for a hero? is it so extraordinary a thing? On the contrary it is something universally human: Ajax should thus have soothed himself. Passion will not wait: the tragic element in the lives of great men does not generally consist in their conflict with time and the inferiority of their fellowmen but in their inability to put off their work a year or two: they cannot wait.--In all duels, the friends who advise have but to ascertain if the principals can wait: if this be not possible, a duel is rational inasmuch as each of the combatants may say: "either I continue to live and the other dies instantly, or vice versa." To wait in such circumstances would be equivalent to the frightful martyrdom of enduring dishonor in the presence of him responsible for the dishonor: and this can easily cost more anguish than life is worth.

62

=Glutting Revenge.=--Coarse men, who feel a sense of injury, are in the habit of rating the extent of their injury as high as possible and of stating the occasion of it in greatly exaggerated language, in order to be able to feast themselves on the sentiments of hatred and revenge thus aroused.

63

=Value of Disparagement.=--Not a few, perhaps the majority of men, find it necessary, in order to retain their self esteem and a certain uprightness in conduct, to mentally disparage and belittle all the people they know. But as the inferior natures are in the majority and as a great deal depends upon whether they retain or lose this uprightness, so--

64

=The Man in a Rage.=--We should be on our guard against the man who is enraged against us, as against one who has attempted our life, for the fact that we still live consists solely in the inability to kill: were looks sufficient, it would have been all up with us long since. To reduce anyone to silence by physical manifestations of savagery or by a terrorizing process is a relic of under civilization. So, too, that cold look which great personages cast upon their servitors is a remnant of the caste distinction between man and man; a specimen of rude antiquity: women, the conservers of the old, have maintained this survival, too, more perfectly than men.

65

=Whither Honesty May Lead.=--Someone once had the bad habit of expressing himself upon occasion, and with perfect honesty, on the subject of the motives of his conduct, which were as good or as bad as the motives of all men. He aroused first disfavor, then suspicion, became gradually of ill repute and was pronounced a person of whom society should beware, until at last the law took note of such a perverted being for reasons which usually have no weight with it or to which it closes its eyes. Lack of taciturnity concerning what is universally held secret, and an irresponsible predisposition to see what no one wants to see--oneself--brought him to prison and to early death.

66

=Punishable, not Punished.=--Our crime against criminals consists in the fact that we treat them as rascals.

67

=Sancta simplicitas of Virtue.=--Every virtue has its privilege: for example, that of contributing its own little bundle of wood to the funeral pyre of one condemned.

68

=Morality and Consequence.=--Not alone the beholders of an act generally estimate the ethical or unethical element in it by the result: no, the one who performed the act does the same. For the motives and the intentions are seldom sufficiently apparent, and amid them the memory itself seems to become clouded by the results of the act, so that a man often ascribes the wrong motives to his acts or regards the remote motives as the direct ones. Success often imparts to an action all the brilliance and honor of good intention, while failure throws the shadow of conscience over the most estimable deeds. Hence arises the familiar maxim of the politician: "Give me only success: with it I can win all the noble souls over to my side--and make myself noble even in my own eyes."--In like manner will success prove an excellent substitute for a better argument. To this very day many well educated men think the triumph of Christianity over Greek philosophy is a proof of the superior truth of the former--although in this case it was simply the coarser and more powerful that triumphed over the more delicate and intellectual. As regards superiority of truth, it is evident that because of it the reviving sciences have connected themselves, point for point, with the philosophy of Epicurus, while Christianity has, point for point, recoiled from it.

69

=Love and Justice.=--Why is love so highly prized at the expense of justice and why are such beautiful things spoken of the former as if it were a far higher entity than the latter? Is the former not palpably a far more stupid thing than the latter?--Certainly, and on that very account so much the more agreeable to everybody: it is blind and has a rich horn of plenty out of which it distributes its gifts to everyone, even when they are unmerited, even when no thanks are returned. It is impartial like the rain, which according to

the bible and experience, wets not alone the unjust but, in certain circumstances, the just as well, and to their skins at that.

70

=Execution.=--How comes it that every execution causes us more pain than a murder? It is the coolness of the executioner, the painful preparation, the perception that here a man is being used as an instrument for the intimidation of others. For the guilt is not punished even if there be any: this is ascribable to the teachers, the parents, the environment, in ourselves, not in the murderer--I mean the predisposing circumstances.

71

=Hope.=--Pandora brought the box containing evils and opened it. It was the gift of the gods to men, a gift of most enticing appearance externally and called the "box of happiness." Thereupon all the evils, (living, moving things) flew out: from that time to the present they fly about and do ill to men by day and night. One evil only did not fly out of the box: Pandora shut the lid at the behest of Zeus and it remained inside. Now man has this box of happiness perpetually in the house and congratulates himself upon the treasure inside of it; it is at his service: he grasps it whenever he is so disposed, for he knows not that the box which Pandora brought was a box of evils. Hence he looks upon the one evil still remaining as the greatest source of happiness--it is hope.--Zeus intended that man, notwithstanding the evils oppressing him, should continue to live and not rid himself of life, but keep on making himself miserable. For this purpose he bestowed hope upon man: it is, in truth, the greatest of evils for it lengthens the ordeal of man.

72

=Degree of Moral Susceptibility Unknown.=--The fact that one has or has not had certain profoundly moving impressions and insights into things--for example, an unjustly executed, slain or martyred father, a faithless wife, a shattering, serious accident,--is the factor upon which the excitation of our passions to white heat principally depends, as well as the course of our whole lives. No one knows to what lengths circumstances (sympathy, emotion) may lead him. He does not know the full extent of his own susceptibility. Wretched environment makes him wretched. It is as a rule not the quality of our experience but its quantity upon which depends the development of our superiority or inferiority, from the point of view of good and evil.

73

=The Martyr Against His Will.=--In a certain movement there was a man who was too cowardly and vacillating ever to contradict his comrades. He was made use of in each emergency, every sacrifice was demanded of him because he feared the disfavor of his comrades more than he feared death: he was a petty, abject spirit. They perceived this and upon the foundation of the qualities just mentioned they elevated him to the altitude of a hero, and finally even of a martyr. Although the cowardly creature always inwardly said No, he always said Yes with his lips, even upon the scaffold, where he died for the tenets of his party: for beside him stood one of his old associates who so domineered him with look and word that he actually went to his death with the utmost fortitude and has ever since been celebrated as a martyr and exalted character.

74

=General Standard.=--One will rarely err if extreme actions be ascribed to vanity, ordinary actions to habit and mean actions to fear.

75

=Misunderstanding of Virtue.=--Whoever has obtained his experience of vice in connection with pleasure as in the case of one with a youth of wild oats behind him, comes to the conclusion that virtue must be connected with self denial. Whoever, on the other hand, has been very much plagued by his passions and vices, longs to find in virtue the rest and peace of the soul. That is why it is possible for two virtuous people to misunderstand one another wholly.

76

=The Ascetic.=--The ascetic makes out of virtue a slavery.

77

=Honor Transferred from Persons to Things.=--Actions prompted by love or by the spirit of self sacrifice for others are universally honored wherever they are manifest. Hence is magnified the value set upon whatever things may be loved or whatever things conduce to self sacrifice: although in themselves they may be worth nothing much. A valiant army is evidence of the value of the thing it fights for.

78

=Ambition a Substitute for Moral Feeling.=--Moral feeling should never become extinct in natures that are destitute of ambition. The ambitious can get along without moral feeling just as well as with it.--Hence the sons of retired, ambitionless families, generally become by a series of rapid gradations, when they lose moral feeling, the most absolute lunkheads.

79

=Vanity Enriches.=--How poor the human mind would be without vanity! As it is, it resembles a well stacked and ever renewed ware-emporium that attracts buyers of every class: they can find almost everything, have almost everything, provided they bring with them the right kind of money--admiration.

80

=Senility and Death.=--Apart from the demands made by religion, it may well be asked why it is more honorable in an aged man, who feels the decline of his powers, to await slow extinction than to fix a term to his existence himself? Suicide in such a case is a quite natural and due proceeding that ought to command respect as a triumph of reason: and did in fact command respect during the times of the masters of Greek philosophy and the bravest Roman patriots, who usually died by their own hand. Eagerness, on the other hand, to keep alive from day to day with the anxious counsel of physicians, without capacity to attain any nearer to one's ideal of life, is far less worthy of respect.--Religions are very rich in refuges from the mandate of suicide: hence they ingratiate themselves with those who cling to life.

81

=Delusions Regarding Victim and Regarding Evil Doer.=--When the rich man takes a possession away from the poor man (for example, a prince who deprives a plebeian of his beloved) there arises in the mind of the poor man a delusion: he thinks the rich man must be wholly perverted to take from him the little that he has. But the rich man appreciates the value of a single possession much less because he is accustomed to many possessions, so that he cannot put himself in the place of the poor man and does not act by any means as ill as the latter supposes. Both have a totally false idea of each other. The iniquities of the mighty which bulk most largely in history are not nearly so monstrous as they seem. The hereditary consciousness of being a superior being with superior environment renders one very callous and lulls the conscience to rest. We all feel, when the difference between ourselves and some other being is exceedingly great, that no element of injustice can be involved, and we kill a fly with no qualms of conscience whatever. So, too, it is no indication of wickedness in Xerxes (whom even the Greeks represent as exceptionally noble) that he deprived a father of his son and had him drawn and quartered because the latter had manifested a troublesome, ominous distrust of an entire expedition: the individual was in this case brushed aside as a pestiferous insect. He was too low and mean to justify continued sentiments of compunction in the ruler of the world. Indeed no cruel man is ever as cruel, in the main, as his victim thinks. The idea of pain is never the same as the sensation. The rule is precisely analogous in the case of the unjust judge, and of the journalist who by means of devious rhetorical methods, leads public opinion astray. Cause and effect are in all these instances entwined with totally different series of feeling and thoughts, whereas it is unconsciously assumed that principal and victim feel and think exactly alike, and because of this assumption the guilt of the one is based upon the pain of the other.

82

=The Soul's Skin.=--As the bones, flesh, entrails and blood vessels are enclosed by a skin that renders the aspect of men endurable, so the impulses and passions of the soul are enclosed by vanity: it is the skin of the soul.

83

=Sleep of Virtue.=--If virtue goes to sleep, it will be more vigorous when it awakes.

84

=Subtlety of Shame.=--Men are not ashamed of obscene thoughts, but they are ashamed when they suspect that obscene thoughts are attributed to them.

85

=Naughtiness Is Rare.=--Most people are too much absorbed in themselves to be bad.

86

=The Mite in the Balance.=--We are praised or blamed, as the one or the other may be expedient, for displaying to advantage our power of discernment.

87

=Luke 18:14 Improved.=--He that humbleth himself wisheth to be exalted.

88

=Prevention of Suicide.=--There is a justice according to which we may deprive a man of life, but none that permits us to deprive him of death: this is merely cruelty.

89

=Vanity.=--We set store by the good opinion of men, first because it is of use to us and next because we wish to give them pleasure (children their parents, pupils their teacher, and well disposed persons all others generally). Only when the good opinion of men is important to somebody, apart from personal advantage or the desire to give pleasure, do we speak of vanity. In this last case, a man wants to give himself pleasure, but at the expense of his fellow creatures, inasmuch as he inspires them with a false opinion of himself or else inspires "good opinion" in such a way that it is a source of pain to others (by arousing envy). The individual generally seeks, through the opinion of others, to attest and fortify the opinion he has of himself; but the potent influence of authority--an influence as old as man himself--leads many, also, to strengthen their own opinion of themselves by means of authority, that is, to borrow from others the expedient of relying more upon the judgment of their fellow men than upon their own.--Interest in oneself, the wish to please oneself attains, with the vain man, such proportions that he first misleads others into a false, unduly exalted estimate of himself and then relies upon the authority of others for his self estimate; he thus creates the delusion that he pins his faith to.--It must, however, be admitted that the vain man does not desire to please others so much as himself and he will often go so far, on this account, as to overlook his own interests: for he often inspires his fellow creatures with malicious envy and renders them ill disposed in order that he may thus increase his own delight in himself.

90

=Limits of the Love of Mankind.=--Every man who has declared that some other man is an ass or a scoundrel, gets angry when the other man conclusively shows that the assertion was erroneous.

91

=Weeping Morality.=--How much delight morality occasions! Think of the ocean of pleasing tears that has flowed from the narration of noble, great-hearted deeds!--This charm of life would disappear if the belief in complete irresponsibility gained the upper hand.

92

=Origin of Justice.=--Justice (reasonableness) has its origin among approximate equals in power, as Thucydides (in the dreadful conferences of the Athenian and Melian envoys) has rightly conceived. Thus, where there exists no demonstrable supremacy and a struggle leads but to mutual, useless damage, the reflection arises that an understanding would best be arrived at and some compromise entered into. The reciprocal nature is hence the first nature of justice. Each party makes the other content inasmuch as each receives what it prizes more highly than the other. Each surrenders to the other what the other wants and receives in return its own desire. Justice is therefore reprisal and exchange upon the basis of an approximate equality of power. Thus revenge pertains originally to the domain of justice as it is a sort of reciprocity. Equally so, gratitude.--Justice reverts naturally to the standpoint of self preservation, therefore to the egoism of this consideration: "why should I injure myself to no purpose and perhaps never attain my

end?"--So much for the origin of justice. Only because men, through mental habits, have forgotten the original motive of so called just and rational acts, and also because for thousands of years children have been brought to admire and imitate such acts, have they gradually assumed the appearance of being unegotistical. Upon this appearance is founded the high estimate of them, which, moreover, like all estimates, is continually developing, for whatever is highly esteemed is striven for, imitated, made the object of self sacrifice, while the merit of the pain and emulation thus expended is, by each individual, ascribed to the thing esteemed.--How slightly moral would the world appear without forgetfulness! A poet could say that God had posted forgetfulness as a sentinel at the portal of the temple of human merit!

93

=Concerning the Law of the Weaker.=--Whenever any party, for instance, a besieged city, yields to a stronger party, under stipulated conditions, the counter stipulation is that there be a reduction to insignificance, a burning and destruction of the city and thus a great damage inflicted upon the stronger party. Thus arises a sort of equalization principle upon the basis of which a law can be established. The enemy has an advantage to gain by its maintenance.--To this extent there is also a law between slaves and masters, limited only by the extent to which the slave may be useful to his master. The law goes originally only so far as the one party may appear to the other potent, invincible, stable, and the like. To such an extent, then, the weaker has rights, but very limited ones. Hence the famous dictum that each has as much law on his side as his power extends (or more accurately, as his power is believed to extend).

94

=The Three Phases of Morality Hitherto.=--It is the first evidence that the animal has become human when his conduct ceases to be based upon the immediately expedient, but upon the permanently useful; when he has, therefore, grown utilitarian, capable of purpose. Thus is manifested the first rule of reason. A still higher stage is attained when he regulates his conduct upon the basis of honor, by means of which he gains mastery of himself and surrenders his desires to principles; this lifts him far above the phase in which he was actuated only by considerations of personal advantage as he understood it. He respects and wishes to be respected. This means that he comprehends utility as a thing dependent upon what his opinion of others is and their opinion of him. Finally he regulates his conduct (the highest phase of morality hitherto attained) by his own standard of men and things. He himself decides, for himself and for others, what is honorable and what is useful. He has become a law giver to opinion, upon the basis of his ever higher developing conception of the utilitarian and the honorable. Knowledge makes him capable of placing the highest utility, (that is, the universal, enduring utility) before merely personal utility,--of placing ennobling recognition of the enduring and universal before the merely temporary: he lives and acts as a collective individuality.

95

=Ethic of the Developed Individual.=--Hitherto the altruistic has been looked upon as the distinctive characteristic of moral conduct, and it is manifest that it was the consideration of universal utility that prompted praise and recognition of altruistic conduct. Must not a radical departure from this point of view be imminent, now that it is being ever more clearly perceived that in the most personal considerations the most general welfare is attained: so that conduct inspired by the most personal considerations of advantage is just the sort which has its origin in the present conception of morality (as a universal utilitarianism)? To contemplate oneself as a complete personality and bear the welfare of that personality in mind in all that one does--this is productive of better results than any sympathetic susceptibility and conduct in behalf of others. Indeed we all suffer from such disparagement of our own personalities, which are at present made to deteriorate from neglect. Capacity is, in fact, divorced from our personality in most cases, and sacrificed to the state, to science, to the needy, as if it were the bad which deserved to be made a sacrifice. Now, we are willing to labor for our fellowmen but only to the extent that we find our own highest advantage in so doing, no more, no less. The whole matter depends upon what may be understood as one's advantage: the crude, undeveloped, rough individualities will be the very ones to estimate it most inadequately.

96

=Usage and Ethic.=--To be moral, virtuous, praiseworthy means to yield obedience to ancient law and hereditary usage. Whether this obedience be rendered readily or with difficulty is long immaterial. Enough that it be rendered. "Good" finally comes to mean him who acts in the traditional manner, as a result of heredity or natural disposition, that is to say does what is customary with scarcely an effort, whatever that may be (for example revenges injuries when revenge, as with the ancient Greeks, was part of

good morals). He is called good because he is good "to some purpose," and as benevolence, sympathy, considerateness, moderation and the like come, in the general course of conduct, to be finally recognized as "good to some purpose" (as utilitarian) the benevolent man, the helpful man, is duly styled "good". (At first other and more important kinds of utilitarian qualities stand in the foreground.) Bad is "not habitual" (unusual), to do things not in accordance with usage, to oppose the traditional, however rational or the reverse the traditional may be. To do injury to one's social group or community (and to one's neighbor as thus understood) is looked upon, through all the variations of moral laws, in different ages, as the peculiarly "immoral" act, so that to-day we associate the word "bad" with deliberate injury to one's neighbor or community. "Egoistic" and "non-egoistic" do not constitute the fundamental opposites that have brought mankind to make a distinction between moral and immoral, good and bad; but adherence to traditional custom, and emancipation from it. How the traditional had its origin is quite immaterial; in any event it had no reference to good and bad or any categorical imperative but to the all important end of maintaining and sustaining the community, the race, the confederation, the nation. Every superstitious custom that originated in a misinterpreted event or casualty entailed some tradition, to adhere to which is moral. To break loose from it is dangerous, more prejudicial to the community than to the individual (because divinity visits the consequences of impiety and sacrilege upon the community rather than upon the individual). Now every tradition grows ever more venerable--the more remote is its origin, the more confused that origin is. The reverence due to it increases from generation to generation. The tradition finally becomes holy and inspires awe. Thus it is that the precept of piety is a far loftier morality than that inculcated by altruistic conduct.

97

=Delight in the Moral.=--A potent species of joy (and thereby the source of morality) is custom. The customary is done more easily, better, therefore preferably. A pleasure is felt in it and experience thus shows that since this practice has held its own it must be good. A manner or moral that lives and lets live is thus demonstrated advantageous, necessary, in contradistinction to all new and not yet adopted practices. The custom is therefore the blending of the agreeable and the useful. Moreover it does not require deliberation. As soon as man can exercise compulsion, he exercises it to enforce and establish his customs, for they are to him attested lifewisdom. So, too, a community of individuals constrains each one of their number to adopt the same moral or custom. The error herein is this: Because a certain custom has been agreeable to the feelings or at least because it proves a means of maintenance, this custom must be imperative, for it is regarded as the only thing that can possibly be consistent with well being. The well being of life seems to spring from it alone. This conception of the customary as a condition of existence is carried into the slightest detail of morality. Inasmuch as insight into true causation is quite restricted in all inferior peoples, a superstitious anxiety is felt that everything be done in due routine. Even when a custom is exceedingly burdensome it is preserved because of its supposed vital utility. It is not known that the same degree of satisfaction can be experienced through some other custom and even higher degrees of satisfaction, too. But it is fully appreciated that all customs do become more agreeable with the lapse of time, no matter how difficult they may have been found in the beginning, and that even the severest way of life may be rendered a matter of habit and therefore a pleasure.

98

=Pleasure and Social Instinct.=--Through his relations with other men, man derives a new species of delight in those pleasurable emotions which his own personality affords him; whereby the domain of pleasurable emotions is made infinitely more comprehensive. No doubt he has inherited many of these feelings from the brutes, which palpably feel delight when they sport with one another, as mothers with their young. So, too, the sexual relations must be taken into account: they make every young woman interesting to every young man from the standpoint of pleasure, and conversely. The feeling of pleasure originating in human relationships makes men in general better. The delight in common, the pleasures enjoyed together heighten one another. The individual feels a sense of security. He becomes better natured. Distrust and malice dissolve. For the man feels the sense of benefit and observes the same feeling in others. Mutual manifestations of pleasure inspire mutual sympathy, the sentiment of homogeneity. The same effect is felt also at mutual sufferings, in a common danger, in stormy weather. Upon such a foundation are built the earliest alliances: the object of which is the mutual protection and safety from threatening misfortunes, and the welfare of each individual. And thus the social instinct develops from pleasure.

99

=The Guiltless Nature of So-Called Bad Acts.=--All "bad" acts are inspired by the impulse to self preservation or, more accurately, by the desire for pleasure and for the avoidance of pain in the individual. Thus are they occasioned, but they are not, therefore, bad.

"Pain self prepared" does not exist, except in the brains of the philosophers, any more than "pleasure self prepared" (sympathy in the Schopenhauer sense). In the condition anterior to the state we kill the creature, be it man or ape, that attempts to pluck the fruit of a tree before we pluck it ourselves should we happen to be hungry at the time and making for that tree: as we would do to-day, so far as the brute is concerned, if we were wandering in savage regions.--The bad acts which most disturb us at present do so because of the erroneous supposition that the one who is guilty of them towards us has a free will in the matter and that it was within his discretion not to have done these evil things. This belief in discretionary power inspires hate, thirst for revenge, malice, the entire perversion of the mental processes, whereas we would feel in no way incensed against the brute, as we hold it irresponsible. To inflict pain not from the instinct of self preservation but in requital--this is the consequence of false judgment and is equally a guiltless course of conduct. The individual can, in that condition which is anterior to the state, act with fierceness and violence for the intimidation of another creature, in order to render his own power more secure as a result of such acts of intimidation. Thus acts the powerful, the superior, the original state founder, who subjugates the weaker. He has the right to do so, as the state nowadays assumes the same right, or, to be more accurate, there is no right that can conflict with this. A foundation for all morality can first be laid only when a stronger individuality or a collective individuality, for example society, the state, subjects the single personalities, hence builds upon their unification and establishes a bond of union. Morality results from compulsion, it is indeed itself one long compulsion to which obedience is rendered in order that pain may be avoided. At first it is but custom, later free obedience and finally almost instinct. At last it is (like everything habitual and natural) associated with pleasure--and is then called virtue.

100

=Shame.=--Shame exists wherever a "mystery" exists: but this is a religious notion which in the earlier period of human civilization had great vogue. Everywhere there were circumscribed spots to which access was denied on account of some divine law, except in special circumstances. At first these spots were quite extensive, inasmuch as stipulated areas could not be trod by the uninitiated, who, when near them, felt tremors and anxieties. This sentiment was frequently transferred to other relationships, for example to sexual relations, which, as the privilege and gateway of mature age, must be withdrawn from the contemplation of youth for its own advantage: relations which many divinities were busy in preserving and sanctifying, images of which divinities were duly placed in marital chambers as guardians. (In Turkish such an apartment is termed a harem or holy thing, the same word also designating the vestibule of a mosque). So, too, Kingship is regarded as a centre from which power and brilliance stream forth, as a mystery to the subjects, impregnated with secrecy and shame, sentiments still quite operative among peoples who in other respects are without any shame at all. So, too, is the whole world of inward states, the so-called "soul," even now, for all non-philosophical persons, a "mystery," and during countless ages it was looked upon as a something of divine origin, in direct communion with deity. It is, therefore, an adytum and occasions shame.

101

=Judge Not.=--Care must be taken, in the contemplation of earlier ages, that there be no falling into unjust scornfulness. The injustice in slavery, the cruelty in the subjugation of persons and peoples must not be estimated by our standard. For in that period the instinct of justice was not so highly developed. Who dare reproach the Genoese Calvin for burning the physician Servetus at the stake? It was a proceeding growing out of his convictions. And the Inquisition, too, had its justification. The only thing is that the prevailing views were false and led to those proceedings which seem so cruel to us, simply because such views have become foreign to us. Besides, what is the burning alive of one individual compared with eternal hell pains for everybody else? And yet this idea then had hold of all the world without in the least vitiating, with its frightfulness, the other idea of a god. Even we nowadays are hard and merciless to political revolutionists, but that is because we are in the habit of believing the state a necessity, and hence the cruelty of the proceeding is not so much understood as in the other cases where the points of view are repudiated. The cruelty to animals shown by children and Italians is due to the same misunderstanding. The animal, owing to the exigencies of the church catechism, is placed too far below the level of mankind.--Much, too, that is frightful and inhuman in history, and which is almost incredible, is rendered less atrocious by the reflection that the one who commands and the one who executes are different persons. The former does not witness the performance and hence it makes no strong impression on him. The latter obeys a superior and hence feels no responsibility. Most princes and military chieftains appear, through lack of true perception, cruel and hard without really being so.--Egoism is not bad because the idea of the "neighbor"--the word is of Christian origin and does not correspond to truth--is very weak in us, and we feel ourselves, in regard to him, as free from responsibility as if plants and stones were involved. That another is in suffering must be learned and it can never be wholly learned.

102

"=Man Always Does Right.="--We do not blame nature when she sends a thunder storm and makes us wet: why then do we term the man who inflicts injury immoral? Because in the latter case we assume a voluntary, ruling, free will, and in the former necessity. But this distinction is a delusion. Moreover, even the intentional infliction of injury is not, in all circumstances termed immoral. Thus, we kill a fly intentionally without thinking very much about it, simply because its buzzing about is disagreeable; and we punish a criminal and inflict pain upon him in order to protect ourselves and society. In the first case it is the individual who, for the sake of preserving himself or in order to spare himself pain, does injury with design: in the second case, it is the state. All ethic deems intentional infliction of injury justified by necessity; that is when it is a matter of self preservation. But these two points of view are sufficient to explain all bad acts done by man to men. It is desired to obtain pleasure or avoid pain. In any sense, it is a question, always, of self preservation. Socrates and Plato are right: whatever man does he always does right: that is, does what seems to him good (advantageous) according to the degree of advancement his intellect has attained, which is always the measure of his rational capacity.

103

=The Inoffensive in Badness.=--Badness has not for its object the infliction of pain upon others but simply our own satisfaction as, for instance, in the case of thirst for vengeance or of nerve excitation. Every act of teasing shows what pleasure is caused by the display of our power over others and what feelings of delight are experienced in the sense of domination. Is there, then, anything immoral in feeling pleasure in the pain of others? Is malicious joy devilish, as Schopenhauer says? In the realm of nature we feel joy in breaking boughs, shattering rocks, fighting with wild beasts, simply to attest our strength thereby. Should not the knowledge that another suffers on our account here, in this case, make the same kind of act, (which, by the way, arouses no qualms of conscience in us) immoral also? But if we had not this knowledge there would be no pleasure in one's own superiority or power, for this pleasure is experienced only in the suffering of another, as in the case of teasing. All pleasure is, in itself, neither good nor bad. Whence comes the conviction that one should not cause pain in others in order to feel pleasure oneself? Simply from the standpoint of utility, that is, in consideration of the consequences, of ultimate pain, since the injured party or state will demand satisfaction and revenge. This consideration alone can have led to the determination to renounce such pleasure.--Sympathy has the satisfaction of others in view no more than, as already stated, badness has the pain of others in view. For there are at least two (perhaps many more) elementary ingredients in personal gratification which enter largely into our self satisfaction: one of them being the pleasure of the emotion, of which species is sympathy with tragedy, and another, when the impulse is to action, being the pleasure of exercising one's power. Should a sufferer be very dear to us, we divest ourselves of pain by the performance of acts of sympathy.--With the exception of some few philosophers, men have placed sympathy very low in the rank of moral feelings: and rightly.

104

=Self Defence.=--If self defence is in general held a valid justification, then nearly every manifestation of so called immoral egoism must be justified, too. Pain is inflicted, robbery or killing done in order to maintain life or to protect oneself and ward off harm. A man lies when cunning and delusion are valid means of self preservation. To injure intentionally when our safety and our existence are involved, or the continuance of our well being, is conceded to be moral. The state itself injures from this motive when it hangs criminals. In unintentional injury the immoral, of course, can not be present, as accident alone is involved. But is there any sort of intentional injury in which our existence and the maintenance of our well being be not involved? Is there such a thing as injuring from absolute badness, for example, in the case of cruelty? If a man does not know what pain an act occasions, that act is not one of wickedness. Thus the child is not bad to the animal, not evil. It disturbs and rends it as if it were one of its playthings. Does a man ever fully know how much pain an act may cause another? As far as our nervous system extends, we shield ourselves from pain. If it extended further, that is, to our fellow men, we would never cause anyone else any pain (except in such cases as we cause it to ourselves, when we cut ourselves, surgically, to heal our ills, or strive and trouble ourselves to gain health). We conclude from analogy that something pains somebody and can in consequence, through recollection and the power of imagination, feel pain also. But what a difference there always is between the tooth ache and the pain (sympathy) that the spectacle of tooth ache occasions! Therefore when injury is inflicted from so called badness the degree of pain thereby experienced is always unknown to us: in so far, however, as pleasure is felt in the act (a sense of one's own power, of one's own excitation) the act is committed to maintain the well being of the individual and hence comes under the purview of self defence and lying for self preservation. Without pleasure, there is no life; the struggle for pleasure is the struggle for life. Whether the individual shall carry on this struggle in such a

way that he be called good or in such a way that he be called bad is something that the standard and the capacity of his own intellect must determine for him.

105

=Justice that Rewards.=--Whoever has fully understood the doctrine of absolute irresponsibility can no longer include the so called rewarding and punishing justice in the idea of justice, if the latter be taken to mean that to each be given his due. For he who is punished does not deserve the punishment. He is used simply as a means to intimidate others from certain acts. Equally, he who is rewarded does not merit the reward. He could not act any differently than he did act. Hence the reward has only the significance of an encouragement to him and others as a motive for subsequent acts. The praise is called out only to him who is running in the race and not to him who has arrived at the goal. Something that comes to someone as his own is neither a punishment nor a reward. It is given to him from utiliarian considerations, without his having any claim to it in justice. Hence one must say "the wise man praises not because a good act has been done" precisely as was once said: "the wise man punishes not because a bad act has been done but in order that a bad act may not be done." If punishment and reward ceased, there would cease with them the most powerful incentives to certain acts and away from other acts. The purposes of men demand their continuance [of punishment and reward] and inasmuch as punishment and reward, blame and praise operate most potently upon vanity, these same purposes of men imperatively require the continuance of vanity.

106

=The Water Fall.=--At the sight of a water fall we may opine that in the countless curves, spirations and dashes of the waves we behold freedom of the will and of the impulses. But everything is compulsory, everything can be mathematically calculated. Thus it is, too, with human acts. We would be able to calculate in advance every single action if we were all knowing, as well as every advance in knowledge, every delusion, every bad deed. The acting individual himself is held fast in the illusion of volition. If, on a sudden, the entire movement of the world stopped short, and an all knowing and reasoning intelligence were there to take advantage of this pause, he could foretell the future of every being to the remotest ages and indicate the path that would be taken in the world's further course. The deception of the acting individual as regards himself, the assumption of the freedom of the will, is a part of this computable mechanism.

107

=Non-Responsibility and Non-Guilt.=--The absolute irresponsibility of man for his acts and his nature is the bitterest drop in the cup of him who has knowledge, if he be accustomed to behold in responsibility and duty the patent of nobility of his human nature. All his estimates, preferences, dislikes are thus made worthless and false. His deepest sentiment, with which he honored the sufferer, the hero, sprang from an error. He may no longer praise, no longer blame, for it is irrational to blame and praise nature and necessity. Just as he cherishes the beautiful work of art, but does not praise it (as it is incapable of doing anything for itself), just as he stands in the presence of plants, he must stand in the presence of human conduct, his own included. He may admire strength, beauty, capacity, therein, but he can discern no merit. The chemical process and the conflict of the elements, the ordeal of the invalid who strives for convalescence, are no more merits than the soul-struggles and extremities in which one is torn this way and that by contending motives until one finally decides in favor of the strongest--as the phrase has it, although, in fact, it is the strongest motive that decides for us. All these motives, however, whatever fine names we may give them, have grown from the same roots in which we believe the baneful poisons lurk. Between good and bad actions there is no difference in kind but, at most, in degree. Good acts are sublimated evil. Bad acts are degraded, imbruted good. The very longing of the individual for self gratification (together with the fear of being deprived of it) obtains satisfaction in all circumstances, let the individual act as he may, that is, as he must: be it in deeds of vanity, revenge, pleasure, utility, badness, cunning, be it in deeds of self sacrifice, sympathy or knowledge. The degrees of rational capacity determine the direction in which this longing impels: every society, every individual has constantly present a comparative classification of benefits in accordance with which conduct is determined and others are judged. But this standard perpetually changes. Many acts are called bad that are only stupid, because the degree of intelligence that decided for them was low. Indeed, in a certain sense, all acts now are stupid, for the highest degree of human intelligence that has yet been attained will in time most certainly be surpassed and then, in retrospection, all our present conduct and opinion will appear as narrow and petty as we now deem the conduct and opinion of savage peoples and ages.--To perceive all these things may occasion profound pain but there is, nevertheless, a consolation. Such pains are birth pains. The butterfly insists upon breaking through the cocoon, he presses through it, tears it to pieces, only to be blinded and confused by the strange light, by the

realm of liberty. By such men as are capable of this sadness--how few there are!--will the first attempt be made to see if humanity may convert itself from a thing of morality to a thing of wisdom. The sun of a new gospel sheds its first ray upon the loftiest height in the souls of those few: but the clouds are massed there, too, thicker than ever, and not far apart are the brightest sunlight and the deepest gloom. Everything is necessity--so says the new knowledge: and this knowledge is itself necessity. All is guiltlessness, and knowledge is the way to insight into this guiltlessness. If pleasure, egoism, vanity be necessary to attest the moral phenomena and their richest blooms, the instinct for truth and accuracy of knowledge; if delusion and confusion of the imagination were the only means whereby mankind could gradually lift itself up to this degree of self enlightenment and self emancipation--who would venture to disparage the means? Who would have the right to feel sad if made aware of the goal to which those paths lead? Everything in the domain of ethic is evolved, changeable, tottering; all things flow, it is true--but all things are also in the stream: to their goal. Though within us the hereditary habit of erroneous judgment, love, hate, may be ever dominant, yet under the influence of awaking knowledge it will ever become weaker: a new habit, that of understanding, not-loving, not-hating, looking from above, grows up within us gradually and in the same soil, and may, perhaps, in thousands of years be powerful enough to endow mankind with capacity to develop the wise, guiltless man (conscious of guiltlessness) as unfailingly as it now developes the unwise, irrational, guilt-conscious man--that is to say, the necessary higher step, not the opposite of it.

THE RELIGIOUS LIFE.

108

=The Double Contest Against Evil.=--If an evil afflicts us we can either so deal with it as to remove its cause or else so deal with it that its effect upon our feeling is changed: hence look upon the evil as a benefit of which the uses will perhaps first become evident in some subsequent period. Religion and art (and also the metaphysical philosophy) strive to effect an alteration of the feeling, partly by an alteration of our judgment respecting the experience (for example, with the aid of the dictum "whom God loves, he chastizes") partly by the awakening of a joy in pain, in emotion especially (whence the art of tragedy had its origin). The more one is disposed to interpret away and justify, the less likely he is to look directly at the causes of evil and eliminate them. An instant alleviation and narcotizing of pain, as is usual in the case of tooth ache, is sufficient for him even in the severest suffering. The more the domination of religions and of all narcotic arts declines, the more searchingly do men look to the elimination of evil itself, which is a rather bad thing for the tragic poets--for there is ever less and less material for tragedy, since the domain of unsparing, immutable destiny grows constantly more circumscribed--and a still worse thing for the priests, for these last have lived heretofore upon the narcoticizing of human ill.

109

=Sorrow is Knowledge.=--How willingly would not one exchange the false assertions of the homines religiosi that there is a god who commands us to be good, who is the sentinel and witness of every act, every moment, every thought, who loves us, who plans our welfare in every misfortune--how willingly would not one exchange these for truths as healing, beneficial and grateful as those delusions! But there are no such truths. Philosophy can at most set up in opposition to them other metaphysical plausibilities (fundamental untruths as well). The tragedy of it all is that, although one cannot believe these dogmas of religion and metaphysics if one adopts in heart and head the potent methods of truth, one has yet become, through human evolution, so tender, susceptible, sensitive, as to stand in need of the most effective means of rest and consolation. From this state of things arises the danger that, through the perception of truth or, more accurately, seeing through delusion, one may bleed to death. Byron has put this into deathless verse:

"Sorrow is knowledge: they who know the most Must mourn the deepest o'er the fatal truth, The tree of knowledge is not that of life."

Against such cares there is no better protective than the light fancy of Horace, (at any rate during the darkest hours and sun eclipses of the soul) expressed in the words

"quid aeternis minorem consiliis animum fatigas? cur non sub alta vel platano vel hac pinu jacentes."[22]

[22] Then wherefore should you, who are mortal, outwear Your soul with a profitless burden of care Say, why should we not, flung at ease neath this pine, Or a plane-tree's broad umbrage, quaff gaily our wine? (Translation of Sir Theodore Martin.)

At any rate, light fancy or heavy heartedness of any degree must be better than a romantic retrogression and desertion of one's flag, an approach to Christianity in any form: for with it, in the present state of knowledge, one can have nothing to do without hopelessly defiling one's intellectual integrity and surrendering it unconditionally. These woes may be painful enough, but without pain one cannot become a leader and guide of humanity: and woe to him who would be such and lacks this pure integrity of the intellect!

110

=The Truth in Religion.=--In the ages of enlightenment justice was not done to the importance of religion, of this there can be no doubt. It is also equally certain that in the ensuing reaction of enlightenment, the demands of justice were far exceeded inasmuch as religion was treated with love, even with infatuation and proclaimed as a profound, indeed the most profound knowledge of the world, which science had but to divest of its dogmatic garb in order to possess "truth" in its unmythical form. Religions must therefore--this was the contention of all foes of enlightenment--sensu allegorico, with regard for the comprehension of the masses, give expression to that ancient truth which is wisdom in itself, inasmuch as all science of modern times has led up to it instead of away from it. So that between the most ancient wisdom of man and all later wisdom there prevails harmony, even similarity of viewpoint; and the advancement of knowledge--if one be disposed to concede such a thing--has to do not with its nature but with its propagation. This whole conception of religion and science is through and through erroneous, and none would to-day be hardy enough to countenance it had not Schopenhauer's rhetoric taken it under protection, this high sounding rhetoric which now gains auditors after the lapse of a generation. Much as may be gained from Schopenhauer's religio-ethical human and cosmical oracle as regards the comprehension of Christianity and other religions, it is nevertheless certain that he erred regarding the value of religion to knowledge. He himself was in this but a servile pupil of the scientific teachers of his time who had all taken romanticism under their protection and renounced the spirit of enlightenment. Had he been born in our own time it would have been impossible for him to have spoken of the sensus allegoricus of religion. He would instead have done truth the justice to say: never has a religion, directly or indirectly, either as dogma or as allegory, contained a truth. For all religions grew out of dread or necessity, and came into existence through an error of the reason. They have, perhaps, in times of danger from science, incorporated some philosophical doctrine or other into their systems in order to make it possible to continue one's existence within them. But this is but a theological work of art dating from the time in which a religion began to doubt of itself. These theological feats of art, which are most common in Christianity as the religion of a learned age, impregnated with philosophy, have led to this superstition of the sensus allegoricus, as has, even more, the habit of the philosophers (namely those half-natures, the poetical philosophers and the philosophising artists) of dealing with their own feelings as if they constituted the fundamental nature of humanity and hence of giving their own religious feelings a predominant influence over the structure of their systems. As the philosophers mostly philosophised under the influence of hereditary religious habits, or at least under the traditional influence of this "metaphysical necessity," they naturally arrived at conclusions closely resembling the Judaic or Christian or Indian religious tenets--resembling, in the way that children are apt to look like their mothers: only in this case the fathers were not certain as to the maternity, as easily happens--but in the innocence of their admiration, they fabled regarding the family likeness of all religion and science. In reality, there exists between religion and true science neither relationship nor friendship, not even enmity: they dwell in different spheres. Every philosophy that lets the religious comet gleam through the darkness of its last outposts renders everything within it that purports to be science, suspicious. It is all probably religion, although it may assume the guise of science.--Moreover, though all the peoples agree concerning certain religious things, for example, the existence of a god (which, by the way, as regards this point, is not the case) this fact would constitute an argument against the thing agreed upon, for example the very existence of a god. The consensus gentium and especially hominum can probably amount only to an absurdity. Against it there is no consensus omnium sapientium whatever, on any point, with the exception of which Goethe's verse speaks:

"All greatest sages to all latest ages Will smile, wink and slily agree 'Tis folly to wait till a fool's empty pate Has learned to be knowing and free. So children of wisdom must look upon fools As creatures who're never the better for schools."

Stated without rhyme or metre and adapted to our case: the consensus sapientium is to the effect that the consensus gentium amounts to an absurdity.

111

=Origin of Religious Worship.=--Let us transport ourselves back to the times in which religious life flourished most vigorously and we will find a fundamental conviction prevalent which we no longer share and which has resulted in the closing of the door to religious life once for all so far as we are concerned: this conviction has to do with nature and intercourse with her. In those times

nothing is yet known of nature's laws. Neither for earth nor for heaven is there a must. A season, sunshine, rain can come or stay away as it pleases. There is wanting, in particular, all idea of natural causation. If a man rows, it is not the oar that moves the boat, but rowing is a magical ceremony whereby a demon is constrained to move the boat. All illness, death itself, is a consequence of magical influences. In sickness and death nothing natural is conceived. The whole idea of "natural course" is wanting. The idea dawns first upon the ancient Greeks, that is to say in a very late period of humanity, in the conception of a Moira [fate] ruling over the gods. If any person shoots off a bow, there is always an irrational strength and agency in the act. If the wells suddenly run dry, the first thought is of subterranean demons and their pranks. It must have been the dart of a god beneath whose invisible influence a human being suddenly collapses. In India, the carpenter (according to Lubbock) is in the habit of making devout offerings to his hammer and hatchet. A Brahmin treats the plume with which he writes, a soldier the weapon that he takes into the field, a mason his trowel, a laborer his plow, in the same way. All nature is, in the opinion of religious people, a sum total of the doings of conscious and willing beings, an immense mass of complex volitions. In regard to all that takes place outside of us no conclusion is permissible that anything will result thus and so, must result thus and so, that we are comparatively calculable and certain in our experiences, that man is the rule, nature the ruleless. This view forms the fundamental conviction that dominates crude, religion-producing, early civilizations. We contemporary men feel exactly the opposite: the richer man now feels himself inwardly, the more polyphone the music and the sounding of his soul, the more powerfully does the uniformity of nature impress him. We all, with Goethe, recognize in nature the great means of repose for the soul. We listen to the pendulum stroke of this great clock with longing for rest, for absolute calm and quiescence, as if we could drink in the uniformity of nature and thereby arrive first at an enjoyment of oneself. Formerly it was the reverse: if we carry ourselves back to the periods of crude civilization, or if we contemplate contemporary savages, we will find them most strongly influenced by rule, by tradition. The individual is almost automatically bound to rule and tradition and moves with the uniformity of a pendulum. To him nature--the uncomprehended, fearful, mysterious nature--must seem the domain of freedom, of volition, of higher power, indeed as an ultra-human degree of destiny, as god. Every individual in such periods and circumstances feels that his existence, his happiness, the existence and happiness of the family, the state, the success or failure of every undertaking, must depend upon these dispositions of nature. Certain natural events must occur at the proper time and certain others must not occur. How can influence be exercised over this fearful unknown, how can this domain of freedom be brought under subjection? thus he asks himself, thus he worries: Is there no means to render these powers of nature as subject to rule and tradition as you are yourself?--The cogitation of the superstitious and magic-deluded man is upon the theme of imposing a law upon nature: and to put it briefly, religious worship is the result of such cogitation. The problem which is present to every man is closely connected with this one: how can the weaker party dictate laws to the stronger, control its acts in reference to the weaker? At first the most harmless form of influence is recollected, that influence which is acquired when the partiality of anyone has been won. Through beseeching and prayer, through abject humiliation, through obligations to regular gifts and propitiations, through flattering homages, it is possible, therefore, to impose some guidance upon the forces of nature, to the extent that their partiality be won: love binds and is bound. Then agreements can be entered into by means of which certain courses of conduct are mutually concluded, vows are made and authorities prescribed. But far more potent is that species of power exercised by means of magic and incantation. As a man is able to injure a powerful enemy by means of the magician and render him helpless with fear, as the love potion operates at a distance, so can the mighty forces of nature, in the opinion of weaker mankind, be controlled by similar means. The principal means of effecting incantations is to acquire control of something belonging to the party to be influenced, hair, finger nails, food from his table, even his picture or his name. With such apparatus it is possible to act by means of magic, for the basic principle is that to everything spiritual corresponds something corporeal. With the aid of this corporeal element the spirit may be bound, injured or destroyed. The corporeal affords the handle by which the spiritual can be laid hold of. In the same way that man influences mankind does he influences some spirit of nature, for this latter has also its corporeal element that can be grasped. The tree, and on the same basis, the seed from which it grew: this puzzling sequence seems to demonstrate that in both forms the same spirit is embodied, now large, now small. A stone that suddenly rolls, is the body in which the spirit works. Does a huge boulder lie in a lonely moor? It is impossible to think of mortal power having placed it there. The stone must have moved itself there. That is to say some spirit must dominate it. Everything that has a body is subject to magic, including, therefore, the spirits of nature. If a god is directly connected with his portrait, a direct influence (by refraining from devout offerings, by whippings, chainings and the like) can be brought to bear upon him. The lower classes in China tie cords around the picture of their god in order to defy his departing favor, when he has left them in the lurch, and tear the picture to pieces, drag it through the streets into dung heaps and gutters, crying: "You dog of a spirit, we housed you in a beautiful temple, we gilded you prettily, we fed you well, we brought you offerings, and yet how ungrateful you are!" Similar displays of resentment have been made against pictures of the mother of god and pictures of saints in Catholic countries during the present century when such pictures would not do their duty during times of pestilence and drought.

Through all these magical relationships to nature countless ceremonies are occasioned, and finally, when their complexity and confusion grow too great, pains are taken to systematize them, to arrange them so that the favorable course of nature's progress, namely the great yearly circle of the seasons, may be brought about by a corresponding course of the ceremonial progress. The aim of religious worship is to influence nature to human advantage, and hence to instil a subjection to law into her that originally she has not, whereas at present man desires to find out the subjection to law of nature in order to guide himself thereby. In brief, the system of religious worship rests upon the idea of magic between man and man, and the magician is older than the priest. But it rests equally upon other and higher ideas. It brings into prominence the sympathetic relation of man to man, the existence of benevolence, gratitude, prayer, of truces between enemies, of loans upon security, of arrangements for the protection of property. Man, even in very inferior degrees of civilization, does not stand in the presence of nature as a helpless slave, he is not willy-nilly the absolute servant of nature. In the Greek development of religion, especially in the relationship to the Olympian gods, it becomes possible to entertain the idea of an existence side by side of two castes, a higher, more powerful, and a lower, less powerful: but both are bound together in some way, on account of their origin and are one species. They need not be ashamed of one another. This is the element of distinction in Greek religion.

112

=At the Contemplation of Certain Ancient Sacrificial Proceedings.=--How many sentiments are lost to us is manifest in the union of the farcical, even of the obscene, with the religious feeling. The feeling that this mixture is possible is becoming extinct. We realize the mixture only historically, in the mysteries of Demeter and Dionysos and in the Christian Easter festivals and religious mysteries. But we still perceive the sublime in connection with the ridiculous, and the like, the emotional with the absurd. Perhaps a later age will be unable to understand even these combinations.

113

=Christianity as Antiquity.=--When on a Sunday morning we hear the old bells ringing, we ask ourselves: Is it possible? All this for a Jew crucified two thousand years ago who said he was God's son? The proof of such an assertion is lacking.--Certainly, the Christian religion constitutes in our time a protruding bit of antiquity from very remote ages and that its assertions are still generally believed--although men have become so keen in the scrutiny of claims--constitutes the oldest relic of this inheritance. A god who begets children by a mortal woman; a sage who demands that no more work be done, that no more justice be administered but that the signs of the approaching end of the world be heeded; a system of justice that accepts an innocent as a vicarious sacrifice in the place of the guilty; a person who bids his disciples drink his blood; prayers for miracles; sins against a god expiated upon a god; fear of a hereafter to which death is the portal; the figure of the cross as a symbol in an age that no longer knows the purpose and the ignominy of the cross--how ghostly all these things flit before us out of the grave of their primitive antiquity! Is one to believe that such things can still be believed?

114

=The Un-Greek in Christianity.=--The Greeks did not look upon the Homeric gods above them as lords nor upon themselves beneath as servants, after the fashion of the Jews. They saw but the counterpart as in a mirror of the most perfect specimens of their own caste, hence an ideal, but no contradiction of their own nature. There was a feeling of mutual relationship, resulting in a mutual interest, a sort of alliance. Man thinks well of himself when he gives himself such gods and places himself in a relationship akin to that of the lower nobility with the higher; whereas the Italian races have a decidedly vulgar religion, involving perpetual anxiety because of bad and mischievous powers and soul disturbers. Wherever the Olympian gods receded into the background, there even Greek life became gloomier and more perturbed.--Christianity, on the other hand, oppressed and degraded humanity completely and sank it into deepest mire: into the feeling of utter abasement it suddenly flashed the gleam of divine compassion, so that the amazed and grace-dazzled stupefied one gave a cry of delight and for a moment believed that the whole of heaven was within him. Upon this unhealthy excess of feeling, upon the accompanying corruption of heart and head, Christianity attains all its psychological effects. It wants to annihilate, debase, stupefy, amaze, bedazzle. There is but one thing that it does not want: measure, standard (das Maas) and therefore is it in the worst sense barbarous, asiatic, vulgar, un-Greek.

115

=Being Religious to Some Purpose.=--There are certain insipid, traffic-virtuous people to whom religion is pinned like the hem of some garb of a higher humanity. These people do well to remain religious: it adorns them. All who are not versed in some

professional weapon--including tongue and pen as weapons--are servile: to all such the Christian religion is very useful, for then their servility assumes the aspect of Christian virtue and is amazingly adorned.--People whose daily lives are empty and colorless are readily religious. This is comprehensible and pardonable, but they have no right to demand that others, whose daily lives are not empty and colorless, should be religious also.

116

=The Everyday Christian.=--If Christianity, with its allegations of an avenging God, universal sinfulness, choice of grace, and the danger of eternal damnation, were true, it would be an indication of weakness of mind and character not to be a priest or an apostle or a hermit, and toil for one's own salvation. It would be irrational to lose sight of one's eternal well being in comparison with temporary advantage: Assuming these dogmas to be generally believed, the every day Christian is a pitiable figure, a man who really cannot count as far as three, and who, for the rest, just because of his intellectual incapacity, does not deserve to be as hard punished as Christianity promises he shall be.

117

=Concerning the Cleverness of Christianity.=--It is a master stroke of Christianity to so emphasize the unworthiness, sinfulness and degradation of men in general that contempt of one's fellow creatures becomes impossible. "He may sin as much as he pleases, he is not by nature different from me. It is I who in every way am unworthy and contemptible." So says the Christian to himself. But even this feeling has lost its keenest sting for the Christian does not believe in his individual degradation. He is bad in his general human capacity and he soothes himself a little with the assertion that we are all alike.

118

=Personal Change.=--As soon as a religion rules, it has for its opponents those who were its first disciples.

119

=Fate of Christianity.=--Christianity arose to lighten the heart, but now it must first make the heart heavy in order to be able to lighten it afterwards. Christianity will consequently go down.

120

=The Testimony of Pleasure.=--The agreeable opinion is accepted as true. This is the testimony of pleasure (or as the church says, the evidence of strength) of which all religions are so proud, although they should all be ashamed of it. If a belief did not make blessed it would not be believed. How little it would be worth, then!

121

=Dangerous Play.=--Whoever gives religious feeling room, must then also let it grow. He can do nothing else. Then his being gradually changes. The religious element brings with it affinities and kinships. The whole circle of his judgment and feeling is clouded and draped in religious shadows. Feeling cannot stand still. One should be on one's guard.

122

=The Blind Pupil.=--As long as one knows very well the strength and the weakness of one's dogma, one's art, one's religion, its strength is still low. The pupil and apostle who has no eye for the weaknesses of a dogma, a religion and so on, dazzled by the aspect of the master and by his own reverence for him, has, on that very account, generally more power than the master. Without blind pupils the influence of a man and his work has never become great. To give victory to knowledge, often amounts to no more than so allying it with stupidity that the brute force of the latter forces triumph for the former.

123

=The Breaking off of Churches.=--There is not sufficient religion in the world merely to put an end to the number of religions.

124

=Sinlessness of Men.=--If one have understood how "Sin came into the world," namely through errors of the reason, through which men in their intercourse with one another and even individual men looked upon themselves as much blacker and wickeder than was really the case, one's whole feeling is much lightened and man and the world appear together in such a halo of harmlessness that a sentiment of well being is instilled into one's whole nature. Man in the midst of nature is as a child left to its own devices. This child indeed dreams a heavy, anxious dream. But when it opens its eyes it finds itself always in paradise.

125

=Irreligiousness of Artists.=--Homer is so much at home among his gods and is as a poet so good natured to them that he must have been profoundly irreligious. That which was brought to him by the popular faith--a mean, crude and partially repulsive superstition--he dealt with as freely as the Sculptor with his clay, therefore with the same freedom that AEschylus and Aristophanes evinced and with which in later times the great artists of the renaissance, and also Shakespeare and Goethe, drew their pictures.

126

=Art and Strength of False Interpretation.=--All the visions, fears, exhaustions and delights of the saint are well known symptoms of sickness, which in him, owing to deep rooted religious and psychological delusions, are explained quite differently, that is not as symptoms of sickness.--So, too, perhaps, the demon of Socrates was nothing but a malady of the ear that he explained, in view of his predominant moral theory, in a manner different from what would be thought rational to-day. Nor is the case different with the frenzy and the frenzied speeches of the prophets and of the priests of the oracles. It is always the degree of wisdom, imagination, capacity and morality in the heart and mind of the interpreters that got so much out of them. It is among the greatest feats of the men who are called geniuses and saints that they made interpreters for themselves who, fortunately for mankind, did not understand them.

127

=Reverence for Madness.=--Because it was perceived that an excitement of some kind often made the head clearer and occasioned fortunate inspirations, it was concluded that the utmost excitement would occasion the most fortunate inspirations. Hence the frenzied being was revered as a sage and an oracle giver. A false conclusion lies at the bottom of all this.

128

=Promises of Wisdom.=--Modern science has as its object as little pain as possible, as long a life as possible--hence a sort of eternal blessedness, but of a very limited kind in comparison with the promises of religion.

129

=Forbidden Generosity.=--There is not enough of love and goodness in the world to throw any of it away on conceited people.

130

=Survival of Religious Training in the Disposition.=--The Catholic Church, and before it all ancient education, controlled the whole domain of means through which man was put into certain unordinary moods and withdrawn from the cold calculation of personal advantage and from calm, rational reflection. A church vibrating with deep tones; gloomy, regular, restraining exhortations from a priestly band, who involuntarily communicate their own tension to their congregation and lead them to listen almost with anxiety as if some miracle were in course of preparation; the awesome pile of architecture which, as the house of a god, rears itself vastly into the vague and in all its shadowy nooks inspires fear of its nerve-exciting power--who would care to reduce men to the level of these things if the ideas upon which they rest became extinct? But the results of all these things are nevertheless not thrown away: the inner world of exalted, emotional, prophetic, profoundly repentant, hope-blessed moods has become inborn in man largely through cultivation. What still exists in his soul was formerly, as he germinated, grew and bloomed, thoroughly disciplined.

131

=Religious After-Pains.=--Though one believe oneself absolutely weaned away from religion, the process has yet not been so thorough as to make impossible a feeling of joy at the presence of religious feelings and dispositions without intelligible content, as, for example, in music; and if a philosophy alleges to us the validity of metaphysical hopes, through the peace of soul therein

attainable, and also speaks of "the whole true gospel in the look of Raphael's Madonna," we greet such declarations and innuendoes with a welcome smile. The philosopher has here a matter easy of demonstration. He responds with that which he is glad to give, namely a heart that is glad to accept. Hence it is observable how the less reflective free spirits collide only with dogmas but yield readily to the magic of religious feelings; it is a source of pain to them to let the latter go simply on account of the former.--Scientific philosophy must be very much on its guard lest on account of this necessity--an evolved and hence, also, a transitory necessity--delusions are smuggled in. Even logicians speak of "presentiments" of truth in ethics and in art (for example of the presentiment that the essence of things is unity) a thing which, nevertheless, ought to be prohibited. Between carefully deduced truths and such "foreboded" things there lies the abysmal distinction that the former are products of the intellect and the latter of the necessity. Hunger is no evidence that there is food at hand to appease it. Hunger merely craves food. "Presentiment" does not denote that the existence of a thing is known in any way whatever. It denotes merely that it is deemed possible to the extent that it is desired or feared. The "presentiment" is not one step forward in the domain of certainty.--It is involuntarily believed that the religious tinted sections of a philosophy are better attested than the others, but the case is at bottom just the opposite: there is simply the inner wish that it may be so, that the thing which beautifies may also be true. This wish leads us to accept bad grounds as good.

132

=Of the Christian Need of Salvation.=--Careful consideration must render it possible to propound some explanation of that process in the soul of a Christian which is termed need of salvation, and to propound an explanation, too, free from mythology: hence one purely psychological. Heretofore psychological explanations of religious conditions and processes have really been in disrepute, inasmuch as a theology calling itself free gave vent to its unprofitable nature in this domain; for its principal aim, so far as may be judged from the spirit of its creator, Schleier-macher, was the preservation of the Christian religion and the maintenance of the Christian theology. It appeared that in the psychological analysis of religious "facts" a new anchorage and above all a new calling were to be gained. Undisturbed by such predecessors, we venture the following exposition of the phenomena alluded to. Man is conscious of certain acts which are very firmly implanted in the general course of conduct: indeed he discovers in himself a predisposition to such acts that seems to him to be as unalterable as his very being. How gladly he would essay some other kind of acts which in the general estimate of conduct are rated the best and highest, how gladly he would welcome the consciousness of well doing which ought to follow unselfish motive! Unfortunately, however, it goes no further than this longing: the discontent consequent upon being unable to satisfy it is added to all other kinds of discontent which result from his life destiny in particular or which may be due to so called bad acts; so that a deep depression ensues accompanied by a desire for some physician to remove it and all its causes.--This condition would not be found so bitter if the individual but compared himself freely with other men: for then he would have no reason to be discontented with himself in particular as he is merely bearing his share of the general burden of human discontent and incompleteness. But he compares himself with a being who alone must be capable of the conduct that is called unegoistic and of an enduring consciousness of unselfish motive, with God. It is because he gazes into this clear mirror, that his own self seems so extraordinarily distracted and so troubled. Thereupon the thought of that being, in so far as it flits before his fancy as retributive justice, occasions him anxiety. In every conceivable small and great experience he believes he sees the anger of the being, his threats, the very implements and manacles of his judge and prison. What succors him in this danger, which, in the prospect of an eternal duration of punishment, transcends in hideousness all the horrors that can be presented to the imagination?

133

Before we consider this condition in its further effects, we would admit to ourselves that man is betrayed into this condition not through his "fault" and "sin" but through a series of delusions of the reason; that it was the fault of the mirror if his own self appeared to him in the highest degree dark and hateful, and that that mirror was his own work, the very imperfect work of human imagination and judgment. In the first place a being capable of absolutely unegoistic conduct is as fabulous as the phoenix. Such a being is not even thinkable for the very reason that the whole notion of "unegoistic conduct," when closely examined, vanishes into air. Never yet has a man done anything solely for others and entirely without reference to a personal motive; indeed how could he possibly do anything that had no reference to himself, that is without inward compulsion (which must always have its basis in a personal need)? How could the ego act without ego?--A god, who, on the other hand, is all love, as he is usually represented, would not be capable of a solitary unegoistic act: whence one is reminded of a reflection of Lichtenberg's which is, in truth, taken from a lower sphere: "We cannot possibly feel for others, as the expression goes; we feel only for ourselves. The assertion sounds hard, but it is not, if rightly understood. A man loves neither his father nor his mother nor his wife nor his child, but simply the feelings which they inspire." Or, as La Rochefoucauld says: "If you think you love your mistress for the mere love of her, you are very much mistaken."

Why acts of love are more highly prized than others, namely not on account of their nature, but on account of their utility, has already been explained in the section on the origin of moral feelings. But if a man should wish to be all love like the god aforesaid, and want to do all things for others and nothing for himself, the procedure would be fundamentally impossible because he _must_ do a great deal for himself before there would be any possibility of doing anything for the love of others. It is also essential that others be sufficiently egoistic to accept always and at all times this self sacrifice and living for others, so that the men of love and self sacrifice have an interest in the survival of unloving and selfish egoists, while the highest morality, in order to maintain itself must formally enforce the existence of immorality (wherein it would be really destroying itself.)--Further: the idea of a god perturbs and discourages as long as it is accepted but as to how it originated can no longer, in the present state of comparative ethnological science, be a matter of doubt, and with the insight into the origin of this belief all faith collapses. What happens to the Christian who compares his nature with that of God is exactly what happened to Don Quixote, who depreciated his own prowess because his head was filled with the wondrous deeds of the heroes of chivalrous romance. The standard of measurement which both employ belongs to the domain of fable.--But if the idea of God collapses, so too, does the feeling of "sin" as a violation of divine rescript, as a stain upon a god-like creation. There still apparently remains that discouragement which is closely allied with fear of the punishment of worldly justice or of the contempt of one's fellow men. The keenest thorn in the sentiment of sin is dulled when it is perceived that one's acts have contravened human tradition, human rules and human laws without having thereby endangered the "eternal salvation of the soul" and its relations with deity. If finally men attain to the conviction of the absolute necessity of all acts and of their utter irresponsibility and then absorb it into their flesh and blood, every relic of conscience pangs will disappear.

134

If now, as stated, the Christian, through certain delusive feelings, is betrayed into self contempt, that is by a false and unscientific view of his acts and feelings, he must, nevertheless, perceive with the utmost amazement that this state of self contempt, of conscience pangs, of despair in particular, does not last, that there are hours during which all these things are wafted away from the soul and he feels himself once more free and courageous. The truth is that joy in his own being, the fulness of his own powers in connection with the inevitable decline of his profound excitation with the lapse of time, bore off the palm of victory. The man loves himself once more, he feels it--but this very new love, this new self esteem seems to him incredible. He can see in it only the wholly unmerited stream of the light of grace shed down upon him. If he formerly saw in every event merely warnings, threats, punishments and every kind of indication of divine anger, he now reads into his experiences the grace of god. The latter circumstance seems to him full of love, the former as a helpful pointing of the way, and his entirely joyful frame of mind now seems to him to be an absolute proof of the goodness of God. As formerly in his states of discouragement he interpreted his conduct falsely so now he does the same with his experiences. His state of consolation is now regarded as the effect produced by some external power. The love with which, at bottom, he loves himself, seems to be the divine love. That which he calls grace and the preliminary of salvation is in reality self-grace, self-salvation.

135

Therefore a certain false psychology, a certain kind of imaginativeness in the interpretation of motives and experiences is the essential preliminary to being a Christian and to experiencing the need of salvation. Upon gaining an insight into this wandering of the reason and the imagination, one ceases to be a Christian.

136

=Of Christian Asceticism and Sanctity.=--Much as some thinkers have exerted themselves to impart an air of the miraculous to those singular phenomena known as asceticism and sanctity, to question which or to account for which upon a rational basis would be wickedness and sacrilege, the temptation to this wickedness is none the less great. A powerful impulse of nature has in every age led to protest against such phenomena. At any rate science, inasmuch as it is the imitation of nature, permits the casting of doubts upon the inexplicable character and the supernal degree of such phenomena. It is true that heretofore science has not succeeded in its attempts at explanation. The phenomena remain unexplained still, to the great satisfaction of those who revere moral miracles. For, speaking generally, the unexplained must rank as the inexplicable, the inexplicable as the non-natural, supernatural, miraculous--so runs the demand in the souls of all the religious and all the metaphysicians (even the artists if they happen to be thinkers), whereas the scientific man sees in this demand the "evil principle."--The universal, first, apparent truth that is encountered in the contemplation of sanctity and asceticism is that their nature is complicated; for nearly always, within the physical world as well as in the moral, the apparently miraculous may be traced successfully to the complex, the obscure, the

multi-conditioned. Let us venture then to isolate a few impulses in the soul of the saint and the ascetic, to consider them separately and then view them as a synthetic development.

137

There is an obstinacy against oneself, certain sublimated forms of which are included in asceticism. Certain kinds of men are under such a strong necessity of exercising their power and dominating impulses that, if other objects are lacking or if they have not succeeded with other objects they will actually tyrannize over some portions of their own nature or over sections and stages of their own personality. Thus do many thinkers bring themselves to views which are far from likely to increase or improve their fame. Many deliberately bring down the contempt of others upon themselves although they could easily have retained consideration by silence. Others contradict earlier opinions and do not shrink from the ordeal of being deemed inconsistent. On the contrary they strive for this and act like eager riders who enjoy horseback exercise most when the horse is skittish. Thus will men in dangerous paths ascend to the highest steeps in order to laugh to scorn their own fear and their own trembling limbs. Thus will the philosopher embrace the dogmas of asceticism, humility, sanctity, in the light of which his own image appears in its most hideous aspect. This crushing of self, this mockery of one's own nature, this spernere se sperni out of which religions have made so much is in reality but a very high development of vanity. The whole ethic of the sermon on the mount belongs in this category: man has a true delight in mastering himself through exaggerated pretensions or excessive expedients and later deifying this tyrannically exacting something within him. In every scheme of ascetic ethics, man prays to one part of himself as if it were god and hence it is necessary for him to treat the rest of himself as devil.

138

=Man is Not at All Hours Equally Moral=; this is established. If one's morality be judged according to one's capacity for great, self sacrificing resolutions and abnegations (which when continual, and made a habit are known as sanctity) one is, in affection, or disposition, the most moral: while higher excitement supplies wholly new impulses which, were one calm and cool as ordinarily, one would not deem oneself even capable of. How comes this? Apparently from the propinquity of all great and lofty emotional states. If a man is brought to an extraordinary pitch of feeling he can resolve upon a fearful revenge or upon a fearful renunciation of his thirst for vengeance indifferently. He craves, under the influences of powerful emotion, the great, the powerful, the immense, and if he chances to perceive that the sacrifice of himself will afford him as much satisfaction as the sacrifice of another, or will afford him more, he will choose self sacrifice. What concerns him particularly is simply the unloading of his emotion. Hence he readily, to relieve his tension, grasps the darts of the enemy and buries them in his own breast. That in self abnegation and not in revenge the element of greatness consisted must have been brought home to mankind only after long habituation. A god who sacrifices himself would be the most powerful and most effective symbol of this sort of greatness. As the conquest of the most hardly conquered enemy, the sudden mastering of a passion--thus does such abnegation _appear_: hence it passes for the summit of morality. In reality all that is involved is the exchange of one idea for another whilst the temperament remained at a like altitude, a like tidal state. Men when coming out of the spell, or resting from such passionate excitation, no longer understand the morality of such instants, but the admiration of all who participated in the occasion sustains them. Pride is their support if the passion and the comprehension of their act weaken. Therefore, at bottom even such acts of self-abnegation are not moral inasmuch as they are not done with a strict regard for others. Rather do others afford the high strung temperament an opportunity to lighten itself through such abnegation.

139

=Even the Ascetic Seeks to Make Life Easier=, and generally by means of absolute subjection to another will or to an all inclusive rule and ritual, pretty much as the Brahmin leaves absolutely nothing to his own volition but is guided in every moment of his life by some holy injunction or other. This subjection is a potent means of acquiring dominion over oneself. One is occupied, hence time does not bang heavy and there is no incitement of the personal will and of the individual passion. The deed once done there is no feeling of responsibility nor the sting of regret. One has given up one's own will once for all and this is easier than to give it up occasionally, as it is also easier wholly to renounce a desire than to yield to it in measured degree. When we consider the present relation of man to the state we perceive unconditional obedience is easier than conditional. The holy person also makes his lot easier through the complete surrender of his life personality and it is all delusion to admire such a phenomenon as the loftiest heroism of morality. It is always more difficult to assert one's personality without shrinking and without hesitation than to give it up altogether in the manner indicated, and it requires moreover more intellect and thought.

140

After having discovered in many of the less comprehensible actions mere manifestations of pleasure in emotion for its own sake, I fancy I can detect in the self contempt which characterises holy persons, and also in their acts of self torture (through hunger and scourgings, distortions and chaining of the limbs, acts of madness) simply a means whereby such natures may resist the general exhaustion of their will to live (their nerves). They employ the most painful expedients to escape if only for a time from the heaviness and weariness in which they are steeped by their great mental indolence and their subjection to a will other than their own.

141

=The Most Usual Means= by which the ascetic and the sanctified individual seeks to make life more endurable comprises certain combats of an inner nature involving alternations of victory and prostration. For this purpose an enemy is necessary and he is found in the so called "inner enemy." That is, the holy individual makes use of his tendency to vanity, domineering and pride, and of his mental longings in order to contemplate his life as a sort of continuous battle and himself as a battlefield, in which good and evil spirits wage war with varying fortune. It is an established fact that the imagination is restrained through the regularity and adequacy of sexual intercourse while on the other hand abstention from or great irregularity in sexual intercourse will cause the imagination to run riot. The imaginations of many of the Christian saints were obscene to a degree; and because of the theory that sexual desires were in reality demons that raged within them, the saints did not feel wholly responsible for them. It is to this conviction that we are indebted for the highly instructive sincerity of their evidence against themselves. It was to their interest that this contest should always be kept up in some fashion because by means of this contest, as already stated, their empty lives gained distraction. In order that the contest might seem sufficiently great to inspire sympathy and admiration in the unsanctified, it was essential that sexual capacity be ever more and more damned and denounced. Indeed the danger of eternal damnation was so closely allied to this capacity that for whole generations Christians showed their children with actual conscience pangs. What evil may not have been done to humanity through this! And yet here the truth is just upside down: an exceedingly unseemly attitude for the truth. Christianity, it is true, had said that every man is conceived and born in sin, and in the intolerable and excessive Christianity of Calderon this thought is again perverted and entangled into the most distorted paradox extant in the well known lines

The greatest sin of man Is the sin of being born.

In all pessimistic religions the act of procreation is looked upon as evil in itself. This is far from being the general human opinion. It is not even the opinion of all pessimists. Empedocles, for example, knows nothing of anything shameful, devilish and sinful in it. He sees rather in the great field of bliss of unholiness simply a healthful and hopeful phenomenon, Aphrodite. She is to him an evidence that strife does not always rage but that some time a gentle demon is to wield the sceptre. The Christian pessimists of practice, had, as stated, a direct interest in the prevalence of an opposite belief. They needed in the loneliness and the spiritual wilderness of their lives an ever living enemy, and a universally known enemy through whose conquest they might appear to the unsanctified as utterly incomprehensible and half unnatural beings. When this enemy at last, as a result of their mode of life and their shattered health, took flight forever, they were able immediately to people their inner selves with new demons. The rise and fall of the balance of cheerfulness and despair maintained their addled brains in a totally new fluctuation of longing and peace of soul. And in that period psychology served not only to cast suspicion on everything human but to wound and scourge it, to crucify it. Man wanted to find himself as base and evil as possible. Man sought to become anxious about the state of his soul, he wished to be doubtful of his own capacity. Everything natural with which man connects the idea of badness and sinfulness (as, for instance, is still customary in regard to the erotic) injures and degrades the imagination, occasions a shamed aspect, leads man to war upon himself and makes him uncertain, distrustful of himself. Even his dreams acquire a tincture of the unclean conscience. And yet this suffering because of the natural element in certain things is wholly superfluous. It is simply the result of opinions regarding the things. It is easy to understand why men become worse than they are if they are brought to look upon the unavoidably natural as bad and later to feel it as of evil origin. It is the master stroke of religions and metaphysics that wish to make man out bad and sinful by nature, to render nature suspicious in his eyes and to so make himself evil, for he learns to feel himself evil when he cannot divest himself of nature. He gradually comes to look upon himself, after a long life lived naturally, so oppressed by a weight of sin that supernatural powers become necessary to relieve him of the burden; and with this notion comes the so called need of salvation, which is the result not of a real but of an imaginary sinfulness. Go through the separate moral expositions in the vouchers of christianity and it will always be found that the demands are excessive in order that it may be impossible for man to satisfy them. The object is not that he may become moral but that he may feel as sinful as possible. If this feeling had not been rendered

agreeable to man--why should he have improvised such an ideal and clung to it so long? As in the ancient world an incalculable strength of intellect and capacity for feeling was squandered in order to increase the joy of living through feastful systems of worship, so in the era of christianity an equally incalculable quantity of intellectual capacity has been sacrificed in another endeavor: that man should in every way feel himself sinful and thereby be moved, inspired, inspirited. To move, to inspire, to inspirit at any cost--is not this the freedom cry of an exhausted, over-ripe, over cultivated age? The circle of all the natural sensations had been gone through a hundred times: the soul had grown weary. Then the saints and the ascetics found a new order of ecstacies. They set themselves before the eyes of all not alone as models for imitation to many, but as fearful and yet delightful spectacles on the boundary line between this world and the next world, where in that period everyone thought he saw at one time rays of heavenly light, at another fearful, threatening tongues of flame. The eye of the saint, directed upon the fearful significance of the shortness of earthly life, upon the imminence of the last judgment, upon eternal life hereafter; this glowering eye in an emaciated body caused men, in the old time world, to tremble to the depths of their being. To look, to look away and shudder, to feel anew the fascination of the spectacle, to yield to it, sate oneself upon it until the soul trembled with ardor and fever--that was the last pleasure left to classical antiquity when its sensibilities had been blunted by the arena and the gladiatorial show.

142

=To Sum Up All That Has Been Said=: that condition of soul at which the saint or expectant saint is rejoiced is a combination of elements which we are all familiar with, except that under other influences than those of mere religious ideation they customarily arouse the censure of men in the same way that when combined with religion itself and regarded as the supreme attainment of sanctity, they are object of admiration and even of prayer--at least in more simple times. Very soon the saint turns upon himself that severity that is so closely allied to the instinct of domination at any price and which inspire even in the most solitary individual the sense of power. Soon his swollen sensitiveness of feeling breaks forth from the longing to restrain his passions within it and is transformed into a longing to master them as if they were wild steeds, the master impulse being ever that of a proud spirit; next he craves a complete cessation of all perturbing, fascinating feelings, a waking sleep, an enduring repose in the lap of a dull, animal, plant-like indolence. Next he seeks the battle and extinguishes it within himself because weariness and boredom confront him. He binds his self-deification with self-contempt. He delights in the wild tumult of his desires and the sharp pain of sin, in the very idea of being lost. He is able to play his very passions, for instance the desire to domineer, a trick so that he goes to the other extreme of abject humiliation and subjection, so that his overwrought soul is without any restraint through this antithesis. And, finally, when indulgence in visions, in talks with the dead or with divine beings overcomes him, this is really but a form of gratification that he craves, perhaps a form of gratification in which all other gratifications are blended. Novalis, one of the authorities in matters of sanctity, because of his experience and instinct, betrays the whole secret with the utmost simplicity when he says: "It is remarkable that the close connection of gratification, religion and cruelty has not long ago made men aware of their inner relationship and common tendency."

143

=Not What the Saint is but what he was in= the eyes of the non-sanctified gives him his historical importance. Because there existed a delusion respecting the saint, his soul states being falsely viewed and his personality being sundered as much as possible from humanity as a something incomparable and supernatural, because of these things he attained the extraordinary with which he swayed the imaginations of whole nations and whole ages. Even he knew himself not for even he regarded his dispositions, passions and actions in accordance with a system of interpretation as artificial and exaggerated as the pneumatic interpretation of the bible. The distorted and diseased in his own nature with its blending of spiritual poverty, defective knowledge, ruined health, overwrought nerves, remained as hidden from his view as from the view of his beholders. He was neither a particularly good man nor a particularly bad man but he stood for something that was far above the human standard in wisdom and goodness. Faith in him sustained faith in the divine and miraculous, in a religious significance of all existence, in an impending day of judgment. In the last rays of the setting sun of the ancient world, which fell upon the christian peoples, the shadowy form of the saint attained enormous proportions--to such enormous proportions, indeed, that down even to our own age, which no longer believes in god, there are thinkers who believe in the saints.

144

It stands to reason that this sketch of the saint, made upon the model of the whole species, can be confronted with many opposing sketches that would create a more agreeable impression. There are certain exceptions among the species who distinguish

themselves either by especial gentleness or especial humanity, and perhaps by the strength of their own personality. Others are in the highest degree fascinating because certain of their delusions shed a particular glow over their whole being, as is the case with the founder of christianity who took himself for the only begotten son of God and hence felt himself sinless; so that through his imagination--that should not be too harshly judged since the whole of antiquity swarmed with sons of god--he attained the same goal, the sense of complete sinlessness, complete irresponsibility, that can now be attained by every individual through science.--In the same manner I have viewed the saints of India who occupy an intermediate station between the christian saints and the Greek philosophers and hence are not to be regarded as a pure type. Knowledge and science--as far as they existed--and superiority to the rest of mankind by logical discipline and training of the intellectual powers were insisted upon by the Buddhists as essential to sanctity, just as they were denounced by the christian world as the indications of sinfulness.

HISTORY OF CLEOPATRA, QUEEN OF EGYPT.

by

JACOB ABBOTT.

With Engravings.

New York: Harper & Brothers, Publishers. 1854.

Entered, according to Act of Congress, in the year one thousand eight hundred and fifty-one, by Harper & Brothers, in the Clerk's Office of the District Court of the Southern District of New York.

PREFACE.

In selecting the subjects for the successive volumes of this series, it has been the object of the author to look for the names of those great personages whose histories constitute useful, and not merely entertaining, knowledge. There are certain names which are familiar, as names, to all mankind; and every person who seeks for any degree of mental cultivation, feels desirous of informing himself of the leading outlines of their history, that he may know, in brief, what it was in their characters or their doings which has given them so widely-extended a fame. This knowledge, which it seems incumbent on every one to obtain in respect to such personages as Hannibal, Alexander, Cæsar, Cleopatra, Darius, Xerxes, Alfred, William the Conqueror, Queen Elizabeth, and Mary, queen of Scots, it is the design and object of these volumes to communicate, in a faithful, and, at the same time, if possible, in an attractive manner. Consequently, great historical names alone are selected; and it has been the writer's aim to present the prominent and leading traits in their characters, and all the important events in their lives, in a bold and free manner, and yet in the plain and simple language which is so obviously required in works which aim at permanent and practical usefulness.

CHAPTER I.

THE VALLEY OF THE NILE.

The story of Cleopatra is a story of crime. It is a narrative of the course and the consequences of unlawful love. In her strange and romantic history we see this passion portrayed with the most complete and graphic fidelity in all its influences and effects; its uncontrollable impulses, its intoxicating joys, its reckless and mad career, and the dreadful remorse and ultimate despair and ruin in which it always and inevitably ends.

* * * * *

Cleopatra was by birth an Egyptian; by ancestry and descent she was a Greek. Thus, while Alexandria and the delta of the Nile formed the scene of the most important events and incidents of her history, it was the blood of Macedon which flowed in her veins. Her character and action are marked by the genius, the courage, the originality, and the impulsiveness pertaining to the stock from which she sprung. The events of her history, on the other hand, and the peculiar character of her adventures, her sufferings, and her sins, were determined by the circumstances with which she was surrounded, and the influences which were brought to bear upon her in the soft and voluptuous clime where the scenes of her early life were laid.

Egypt has always been considered as physically the most remarkable country on the globe. It is a long and narrow valley of verdure and fruitfulness, completely insulated from the rest of the habitable world. It is more completely insulated, in fact, than any literal island could be, inasmuch as deserts are more impassable than seas. The very existence of Egypt is a most extraordinary phenomenon. If we could but soar with the wings of an eagle into the air, and look down upon the scene, so as to observe the operation of that grand and yet simple process by which this long and wonderful valley, teeming so profusely with animal and vegetable life, has been formed, and is annually revivified and renewed, in the midst of surrounding wastes of silence, desolation,

and death, we should gaze upon it with never-ceasing admiration and pleasure. We have not the wings of the eagle, but the generalizations of science furnish us with a sort of substitute for them. The long series of patient, careful, and sagacious observations, which have been continued now for two thousand years, bring us results, by means of which, through our powers of mental conception, we may take a comprehensive survey of the whole scene, analogous, in some respects, to that which direct and actual vision would afford us, if we could look down upon it from the eagle's point of view. It is, however, somewhat humiliating to our pride of intellect to reflect that long-continued philosophical investigations and learned scientific research are, in such a case as this, after all, in some sense, only a sort of substitute for wings. A human mind connected with a pair of eagle's wings would have solved the mystery of Egypt in a week; whereas science, philosophy, and research, confined to the surface of the ground, have been occupied for twenty centuries in accomplishing the undertaking.

It is found at last that both the existence of Egypt itself, and its strange insulation in the midst of boundless tracts of dry and barren sand, depend upon certain remarkable results of the general laws of rain. The water which is taken up by the atmosphere from the surface of the sea and of the land by evaporation, falls again, under certain circumstances, in showers of rain, the frequency and copiousness of which vary very much in different portions of the earth. As a general principle, rains are much more frequent and abundant near the equator than in temperate climes, and they grow less and less so as we approach the poles. This might naturally have been expected; for, under the burning sun of the equator, the evaporation of water must necessarily go on with immensely greater rapidity than in the colder zones, and all the water which is taken up must, of course, again come down.

It is not, however, wholly by the latitude of the region in which the evaporation takes place that the quantity of rain which falls from the atmosphere is determined; for the condition on which the falling back, in rain, of the water which has been taken up by evaporation mainly depends, is the cooling of the atmospheric stratum which contains it; and this effect is produced in very various ways, and many different causes operate to modify it. Sometimes the stratum is cooled by being wafted over ranges of mountains; sometimes by encountering and becoming mingled with cooler currents of air; and sometimes, again, by being driven in winds toward a higher, and, consequently, cooler latitude. If, on the other hand, air moves from cold mountains toward warm and sunny plains, or from higher latitudes to lower, or if, among the various currents into which it falls, it becomes mixed with air warmer than itself, its capacity for containing vapor in solution is increased, and, consequently, instead of releasing its hold upon the waters which it has already in possession, it becomes thirsty for more. It moves over a country, under these circumstances, as a warm and drying wind. Under a reverse of circumstances it would have formed drifting mists, or, perhaps, even copious showers of rain.

It will be evident, from these considerations, that the frequency of the showers, and the quantity of the rain which will fall, in the various regions respectively which the surface of the earth presents, must depend on the combined influence of many causes, such as the warmth of the climate, the proximity and the direction of mountains and of seas, the character of the prevailing winds, and the reflecting qualities of the soil. These and other similar causes, it is found, do, in fact, produce a vast difference in the quantity of rain which falls in different regions. In the northern part of South America, where the land is bordered on every hand by vast tropical seas, which load the hot and thirsty air with vapor, and where the mighty Cordillera of the Andes rears its icy summits to chill and precipitate the vapors again, a quantity of rain amounting to more than ten feet in perpendicular height falls in a year. At St. Petersburg, on the other hand, the quantity thus falling in a year is but little more than one foot. The immense deluge which pours down from the clouds in South America would, if the water were to remain where it fell, wholly submerge and inundate the country. As it is, in flowing off through the valleys to the sea, the united torrents form the greatest river on the globe--the Amazon; and the vegetation, stimulated by the heat, and nourished by the abundant and incessant supplies of moisture, becomes so rank, and loads the earth with such an entangled and matted mass of trunks, and stems, and twining wreaths and vines, that man is almost excluded from the scene. The boundless forests become a vast and almost impenetrable jungle, abandoned to wild beasts, noxious reptiles, and huge and ferocious birds of prey.

Of course, the district of St. Petersburg, with its icy winter, its low and powerless sun, and its twelve inches of annual rain, must necessarily present, in all its phenomena of vegetable and animal life, a striking contrast to the exuberant prolificness of New Grenada. It is, however, after all, not absolutely the opposite extreme. There are certain regions on the surface of the earth that are actually rainless; and it is these which present us with the true and real contrast to the luxuriant vegetation and teeming life of the country of the Amazon. In these rainless regions all is necessarily silence, desolation, and death. No plant can grow; no animal can live. Man, too, is forever and hopelessly excluded. If the exuberant abundance of animal and vegetable life shut him out, in some measure, from regions which an excess of heat and moisture render too prolific, the total absence of them still more effectually forbids him a home in these. They become, therefore, vast wastes of dry and barren sands in which no root can find nourishment, and of dreary rocks to which not even a lichen can cling.

The most extensive and remarkable rainless region on the earth is a vast tract extending through the interior and northern part of Africa, and the southwestern part of Asia. The Red Sea penetrates into this tract from the south, and thus breaks the outline and continuity of its form, without, however, altering, or essentially modifying its character. It divides it, however, and to the different portions which this division forms, different names have been given. The Asiatic portion is called Arabia Deserta; the African tract has received the name of Sahara; while between these two, in the neighborhood of Egypt, the barren region is called simply _the desert_. The whole tract is marked, however, throughout, with one all-pervading character: the absence of vegetable, and, consequently, of animal life, on account of the absence of rain. The rising of a range of lofty mountains in the center of it, to produce a precipitation of moisture from the air, would probably transform the whole of the vast waste into as verdant, and fertile, and populous a region I as any on the globe.

[Illustration: VALLEY OF THE NILE]

As it is, there are no such mountains. The whole tract is nearly level, and so little elevated above the sea, that, at the distance of many hundred miles in the interior, the land rises only to the height of a few hundred feet above the surface of the Mediterranean; whereas in New Grenada, at less than one hundred miles from the sea, the chain of the Andes rises to elevations of from ten to fifteen thousand feet. Such an ascent as that of a few hundred feet in hundreds of miles would be wholly imperceptible to any ordinary mode of observation; and the great rainless region, accordingly, of Africa and Asia is, as it appears to the traveler, one vast plain, a thousand miles wide and five thousand miles long, with only one considerable interruption to the dead monotony which reigns, with that exception, every where over the immense expanse of silence and solitude. The single interval of fruitfulness and life is the valley of the Nile.

There are, however, in fact, three interruptions to the continuity of this plain, though only one of them constitutes any considerable interruption to its barrenness. They are all of them valleys, extending from north to south, and lying side by side. The most easterly of these valleys is so deep that the waters of the ocean flow into it from the south, forming a long and narrow inlet called the Red Sea. As this inlet communicates freely with the ocean, it is always nearly of the same level, and as the evaporation from it is not sufficient to produce rain, it does not even fertilize its own shores. Its presence varies the dreary scenery of the landscape, it is true, by giving us surging waters to look upon instead of driving sands; but this is all. With the exception of the spectacle of an English steamer passing, at weary intervals, over its dreary expanse, and some moldering remains of ancient cities on its eastern shore, it affords scarcely any indications of life. It does very little, therefore, to relieve the monotonous aspect of solitude and desolation which reigns over the region into which it has intruded.

The most westerly of the three valleys to which we have alluded is only a slight depression of the surface of the land marked by a line of _oases_. The depression is not sufficient to admit the waters of the Mediterranean, nor are there any rains over any portion of the valley which it forms sufficient to make it the bed of a stream. Springs issue, however, here and there, in several places, from the ground, and, percolating through the sands along the valley, give fertility to little dells, long and narrow, which, by the contrast that they form with the surrounding desolation, seem to the traveler to possess the verdure and beauty of Paradise. There is a line of these oases extending along this westerly depression, and some of them are of considerable extent. The oasis of Siweh, on which stood the far-famed temple of Jupiter Ammon, was many miles in extent, and was said to have contained in ancient times a population of eight thousand souls. Thus, while the most easterly of the three valleys which we have named was sunk so low as to admit the ocean to flow freely into it, the most westerly was so slightly depressed that it gained only a circumscribed and limited fertility through the springs, which, in the lowest portions of it, oozed from the ground. The third valley--the central one--remains now to be described.

The reader will observe, by referring once more to the map, that south of the great rainless region of which we are speaking, there lie groups and ranges of mountains in Abyssinia, called the Mountains of the Moon. These mountains are near the equator, and the relation which they sustain to the surrounding seas, and to currents of wind which blow in that quarter of the world, is such, that they bring down from the atmosphere, especially in certain seasons of the year, vast and continual torrents of rain. The water which thus falls drenches the mountain sides and deluges the valleys. There is a great portion of it which can not flow to the southward or eastward toward the sea, as the whole country consists, in those directions, of continuous tracts of elevated land. The rush of water thus turns to the northward, and, pressing on across the desert through the great central valley which we have referred to above, it finds an outlet, at last, in the Mediterranean, at a point two thousand miles distant from the place where the immense condenser drew it from the skies. The river thus created is the Nile. It is formed, in a word, by the surplus waters of a district inundated with rains, in their progress across a rainless desert, seeking the sea.

If the surplus of water upon the Abyssinian mountains had been constant and uniform, the stream, in its passage across the desert, would have communicated very little fertility to the barren sands which it traversed. The immediate banks of the river would have, perhaps, been fringed with verdure, but the influence of the irrigation would have extended no further than the water itself could have reached, by percolation through the sand. But the flow of the water is not thus uniform and steady. In a certain season of the year the rains are incessant, and they descend with such abundance and profusion as almost to inundate the districts where they fall. Immense torrents stream down the mountain sides; the valleys are deluged; plains turn into morasses, and morasses into lakes. In a word, the country becomes half submerged, and the accumulated mass of waters would rush with great force and violence down the central valley of the desert, which forms their only outlet, if the passage were narrow, and if it made any considerable descent in its course to the sea. It is, however, not narrow, and the descent is very small. The depression in the surface of the desert, through which the water flows, is from five to ten miles wide, and, though it is nearly two thousand miles from the rainy district across the desert to the sea, the country for the whole distance is almost level. There is only sufficient descent, especially for the last thousand miles, to determine a very gentle current to the northward in the waters of the stream.

Under these circumstances, the immense quantity of water which falls in the rainy district in these inundating tropical showers, expands over the whole valley, and forms for a time an immense lake, extending in length across the whole breadth of the desert. This lake is, of course, from five to ten miles wide, and a thousand miles long. The water in it is shallow and turbid, and it has a gentle current toward the north. The rains, at length, in a great measure cease; but it requires some months for the water to run off and leave the valley dry. As soon as it is gone, there springs up from the whole surface of the ground which has been thus submerged a most rank and luxuriant vegetation.

This vegetation, now wholly regulated and controlled by the hand of man, must have been, in its original and primeval state, of a very peculiar character. It must have consisted of such plants only as could exist under the condition of having the soil in which they grew laid, for a quarter of the year, wholly under water. This circumstance, probably, prevented the valley of the Nile from having been, like other fertile tracts of land, encumbered, in its native state, with forests. For the same reason, wild beasts could never have haunted it. There were no forests to shelter them, and no refuge or retreat for them but the dry and barren desert, during the period of the annual inundations. This most extraordinary valley seems thus to have been formed and preserved by Nature herself for the special possession of man. She herself seems to have held it in reserve for him from the very morning of creation, refusing admission into it to every plant and every animal that might hinder or disturb his occupancy and control. And if he were to abandon it now for a thousand years, and then return to it once more, he would find it just as he left it, ready for his immediate possession. There would be no wild beasts that he must first expel, and no tangled forests would have sprung up, that his ax must first remove. Nature is the husbandman who keeps this garden of the world in order, and the means and machinery by which she operates are the grand evaporating surfaces of the seas, the beams of the tropical sun, the lofty summits of the Abyssinian mountains, and, as the product and result of all this instrumentality, great periodical inundations of summer rain.

For these or some other reasons Egypt has been occupied by man from the most remote antiquity. The oldest records of the human race, made three thousand years ago, speak of Egypt as ancient then, when they were written. Not only is Tradition silent, but even Fable herself does not attempt to tell the story of the origin of her population. Here stand the oldest and most enduring monuments that human power has ever been able to raise. It is, however, somewhat humiliating to the pride of the race to reflect that the loftiest and proudest, as well as the most permanent and stable of all the works which man has ever accomplished, are but the incidents and adjuncts of a thin stratum of alluvial fertility, left upon the sands by the subsiding waters of summer showers.

The most important portion of the alluvion of the Nile is the northern portion, where the valley widens and opens toward the sea, forming a triangular plain of about one hundred miles in length on each of the sides, over which the waters of the river flow in a great number of separate creeks and channels. The whole area forms a vast meadow, intersected every where with slow-flowing streams of water, and presenting on its surface the most enchanting pictures of fertility, abundance, and beauty. This region is called the Delta of the Nile.

[Illustration: DELTA OF THE NILE]

The sea upon the coast is shallow, and the fertile country formed by the deposits of the river seems to have projected somewhat beyond the line of the coast; although, as the land has not advanced perceptibly for the last eighteen hundred years, it may be somewhat doubtful whether the whole of the apparent protrusion is not due to the natural conformation of the coast, rather than to any changes made by the action of the river.

The Delta of the Nile is so level itself, and so little raised above the level of the Mediterranean, that the land seems almost a continuation of the same surface with the sea, only, instead of blue waters topped with white-crested waves, we have broad tracts of waving grain, and gentle swells of land crowned with hamlets and villages. In approaching the coast, the navigator has no distant view of all this verdure and beauty. It lies so low that it continues beneath the horizon until the ship is close upon the shore. The first landmarks, in fact, which the seaman makes, are the tops of trees growing apparently out of the water, or the summit of an obelisk, or the capital of a pillar, marking the site of some ancient and dilapidated city.

The most easterly of the channels by which the waters of the river find their way through the Delta to the sea, is called, as it will be seen marked upon the map, the Pelusiac branch. It forms almost the boundary of the fertile region of the Delta on the eastern side. There was an ancient city named Pelusium near the mouth of it. This was, of course, the first Egyptian city reached by those who arrived by land from the eastward, traveling along the shores of the Mediterranean Sea. On account of its thus marking the eastern frontier of the country, it became a point of great importance, and is often mentioned in the histories of ancient times.

The westernmost mouth of the Nile, on the other hand, was called the Canopic mouth. The distance along the coast from the Canopic mouth to Pelusium was about a hundred miles. The outline of the coast was formerly, as it still continues to be, very irregular, and the water shallow. Extended banks of sand protruded into the sea, and the sea itself, as if in retaliation, formed innumerable creeks, and inlets, and lagoons in the land. Along this irregular and uncertain boundary the waters of the Nile and the surges of the Mediterranean kept up an eternal war, with energies so nearly equal, that now, after the lapse of eighteen hundred years since the state of the contest began to be recorded, neither side has been found to have gained any perceptible advantage over the other. The river brings the sands down, and the sea drives them incessantly back, keeping the whole line of the shore in such a condition as to make it extremely dangerous and difficult of access to man.

It will be obvious, from this description of the valley of the Nile, that it formed a country which was in ancient times isolated and secluded, in a very striking manner, from all the rest of the world. It was wholly shut in by deserts, on every side, by land; and the shoals, and sand-bars, and other dangers of navigation which marked the line of the coast, seemed to forbid approach by sea. Here it remained for many ages, under the rule of its own native ancient kings. Its population was peaceful and industrious. Its scholars were famed throughout the world for their learning, their science, and their philosophy. It was in these ages, before other nations had intruded upon its peaceful seclusion, that the Pyramids were built, and the enormous monoliths carved, and those vast temples reared whose ruined columns are now the wonder of mankind. During these remote ages, too, Egypt was, as now, the land of perpetual fertility and abundance. There would always be corn in Egypt, wherever else famine might rage. The neighboring nations and tribes in Arabia, Palestine, and Syria, found their way to it, accordingly, across the deserts on the eastern side, when driven by want, and thus opened a way of communication. At length the Persian monarchs, after extending their empire westward to the Mediterranean, found access by the same road to Pelusium, and thence overran and conquered the country. At last, about two hundred and fifty years before the time of Cleopatra, Alexander the Great, when he subverted the Persian empire, took possession of Egypt, and annexed it, among the other Persian provinces, to his own dominions. At the division of Alexander's empire, after his death, Egypt fell to one of his generals, named Ptolemy. Ptolemy made it his kingdom, and left it, at his death, to his heirs. A long line of sovereigns succeeded him, known in history as the dynasty of the Ptolemies--Greek princes, reigning over an Egyptian realm. Cleopatra was the daughter of the eleventh in the line.

The capital of the Ptolemies was Alexandria. Until the time of Alexander's conquest, Egypt had no sea-port. There were several landing-places along the coast, but no proper harbor. In fact, Egypt had then so little commercial intercourse with the rest of the world, that she scarcely needed any. Alexander's engineers, however, in exploring the shore, found a point not far from the Canopic mouth of the Nile where the water was deep, and where there was an anchorage ground protected by an island. Alexander founded a city there, which he called by his own name. He perfected the harbor by artificial excavations and embankments. A lofty light-house was reared, which formed a landmark by day, and exhibited a blazing star by night to guide the galleys of the Mediterranean in. A canal was made to connect the port with the Nile, and warehouses were erected to contain the stores of merchandise. In a word, Alexandria became at once a great commercial capital. It was the seat, for several centuries, of the magnificent government of the Ptolemies; and so well was its situation chosen for the purposes intended, that it still continues, after the lapse of twenty centuries of revolution and change, one of the principal emporiums of the commerce of the East.

CHAPTER II.

THE PTOLEMIES.

The founder of the dynasty of the Ptolemies--the ruler into whose hands the kingdom of Egypt fell, as has already been stated, at the death of Alexander the Great--was a Macedonian general in Alexander's army. The circumstances of his birth, and the events which led to his entering into the service of Alexander, were somewhat peculiar. His mother, whose name was Arsinoë, was a personal favorite and companion of Philip, king of Macedon, the father of Alexander. Philip at length gave Arsinoë in marriage to a certain man of his court named Lagus. A very short time after the marriage, Ptolemy was born. Philip treated the child with the same consideration and favor that he had evinced toward the mother. The boy was called the son of Lagus, but his position in the royal court of Macedon was as high and honorable, and the attentions which he received were as great, as he could have expected to enjoy if he had been in reality a son of the king. As he grew up, he attained to official stations of considerable responsibility and power.

In the course of time, a certain transaction occurred, by means of which Ptolemy involved himself in serious difficulty with Philip, though by the same means he made Alexander very strongly his friend. There was a province of the Persian empire called Caria, situated in the southwestern part of Asia Minor. The governor of this province had offered his daughter to Philip as the wife of one of his sons named Aridæus, the half brother of Alexander. Alexander's mother, who was not the mother of Aridæus, was jealous of this proposed marriage. She thought that it was part of a scheme for bringing Aridæus forward into public notice, and finally making him the heir to Philip's throne; whereas she was very earnest that this splendid inheritance should be reserved for her own son. Accordingly, she proposed to Alexander that they should send a secret embassage to the Persian governor, and represent to him that it would be much better, both for him and for his daughter, that she should have Alexander instead of Aridæus for a husband, and induce him, if possible, to demand of Philip that he should make the change.

Alexander entered readily into this scheme, and various courtiers, Ptolemy among the rest, undertook to aid him in the accomplishment of it. The embassy was sent. The governor of Caria was very much pleased with the change which they proposed to him. In fact, the whole plan seemed to be going on very successfully toward its accomplishment, when, by some means or other, Philip discovered the intrigue. He went immediately into Alexander's apartment, highly excited with resentment and anger. He had never intended to make Aridæus, whose birth on the mother's side was obscure and ignoble, the heir to his throne, and he reproached Alexander in the bitterest terms for being of so debased and degenerate a spirit as to desire to marry the daughter of a Persian governor; a man who was, in fact, the mere slave, as he said, of a barbarian king.

Alexander's scheme was thus totally defeated; and so displeased was his father with the officers who had undertaken to aid him in the execution of it, that he banished them all from the kingdom. Ptolemy, in consequence of this decree, wandered about an exile from his country for some years, until at length the death of Philip enabled Alexander to recall him. Alexander succeeded his father as King of Macedon, and immediately made Ptolemy one of his principal generals. Ptolemy rose, in fact, to a very high command in the Macedonian army, and distinguished himself very greatly in all the celebrated conqueror's subsequent campaigns. In the Persian invasion, Ptolemy commanded one of the three grand divisions of the army, and he rendered repeatedly the most signal services to the cause of his master. He was employed on the most distant and dangerous enterprises, and was often intrusted with the management of affairs of the utmost importance. He was very successful in all his undertakings. He conquered armies, reduced fortresses, negotiated treaties, and evinced, in a word, the highest degree of military energy and skill. He once saved Alexander's life by discovering and revealing a dangerous conspiracy which had been formed against the king. Alexander had the opportunity to requite this favor, through a divine interposition vouchsafed to him, it was said, for the express purpose of enabling him to evince his gratitude. Ptolemy had been wounded by a poisoned arrow, and when all the remedies and antidotes of the physicians had failed, and the patient was apparently about to die, an effectual means of cure was revealed to Alexander in a dream, and Ptolemy, in his turn, was saved.

At the great rejoicings at Susa, when Alexander's conquests were completed, Ptolemy was honored with a golden crown, and he was married, with great pomp and ceremony, to Artacama, the daughter of one of the most distinguished Persian generals.

At length Alexander died suddenly, after a night of drinking and carousal at Babylon. He had no son old enough to succeed him, and his immense empire was divided among his generals. Ptolemy obtained Egypt for his share. He repaired immediately to Alexandria, with a great army, and a great number of Greek attendants and followers, and there commenced a reign which continued, in great prosperity and splendor, for forty years. The native Egyptians were reduced, of course, to subjection and bondage. All the offices in the army, and all stations of trust and responsibility in civil life, were filled by Greeks. Alexandria was a Greek city, and it became at once one of the most important commercial centers in all those seas. Greek and Roman travelers found now a language spoken in Egypt which they could understand, and philosophers and scholars could gratify the curiosity which they had so long felt, in respect to the institutions, and monuments, and wonderful physical characteristics of the country,

with safety and pleasure. In a word, the organization of a Greek government over the ancient kingdom, and the establishment of the great commercial relations of the city of Alexandria, conspired to bring Egypt out from its concealment and seclusion, and to open it in some measure to the intercourse, as well as to bring it more fully under the observation, of the rest of mankind.

Ptolemy, in fact, made it a special object of his policy to accomplish these ends. He invited Greek scholars, philosophers, poets, and artists, in great numbers, to come to Alexandria, and to make his capital their abode. He collected an immense library, which subsequently, under the name of the Alexandrian library, became one of the most celebrated collections of books and manuscripts that was ever made. We shall have occasion to refer more particularly to this library in the next chapter.

Besides prosecuting these splendid schemes for the aggrandizement of Egypt, King Ptolemy was engaged, during almost the whole period of his reign, in waging incessant wars with the surrounding nations. He engaged in these wars, in part, for the purpose of extending the boundaries of his empire, and in part for self-defense against the aggressions and encroachments of other powers. He finally succeeded in establishing his kingdom on the most stable and permanent basis, and then, when he was drawing toward the close of his life, being in fact over eighty years of age, he abdicated his throne in favor of his youngest son, whose name was also Ptolemy. Ptolemy the father, the founder of the dynasty, is known commonly in history by the name of Ptolemy Soter. His son is called Ptolemy Philadelphus. This son, though the youngest, was preferred to his brothers as heir to the throne on account of his being the son of the most favored and beloved of the monarch's wives. The determination of Soter to abdicate the throne himself arose from his wish to put this favorite son in secure possession of it before his death, in order to prevent the older brothers from disputing the succession. The coronation of Philadelphus was made one of the most magnificent and imposing ceremonies that royal pomp and parade ever arranged. Two years afterward Ptolemy the father died, and was buried by his son with a magnificence almost equal to that of his own coronation. His body was deposited in a splendid mausoleum, which had been built for the remains of Alexander; and so high was the veneration which was felt by mankind for the greatness of his exploits and the splendor of his reign, that divine honors were paid to his memory. Such was the origin of the great dynasty of the Ptolemies.

Some of the early sovereigns of the line followed in some degree the honorable example set them by the distinguished founder of it; but this example was soon lost, and was succeeded by the most extreme degeneracy and debasement. The successive sovereigns began soon to live and to reign solely for the gratification of their own sensual propensities and passions. Sensuality begins sometimes with kindness, but it ends always in the most reckless and intolerable cruelty. The Ptolemies became, in the end, the most abominable and terrible tyrants that the principle of absolute and irresponsible power ever produced. There was one vice in particular, a vice which they seem to have adopted from the Asiatic nations of the Persian empire, that resulted in the most awful consequences. This vice was incest.

The law of God, proclaimed not only in the Scriptures, but in the native instincts of the human soul, forbids intermarriages among those connected by close ties of consanguinity. The necessity for such a law rests on considerations which can not here be fully explained. They are considerations, however, which arise from causes inherent in the very nature of man as a social being, and which are of universal, perpetual, and insurmountable force. To guard his creatures against the deplorable consequences, both physical and moral, which result from the practice of such marriages, the great Author of Nature has implanted in every mind an instinctive sense of their criminality, powerful enough to give effectual warning of the danger, and so universal as to cause a distinct condemnation of them to be recorded in almost every code of written law that has ever been promulgated among mankind. The Persian sovereigns were, however, above all law, and every species of incestuous marriage was practiced by them without shame. The Ptolemies followed their example.

One of the most striking exhibitions of the nature of incestuous domestic life which is afforded by the whole dismal panorama of pagan vice and crime, is presented in the history of the great-grandfather of the Cleopatra who is the principal subject of this narrative. He was Ptolemy Physcon, the seventh in the line. It is necessary to give some particulars of his history and that of his family, in order to explain the circumstances under which Cleopatra herself came upon the stage. The name Physcon, which afterward became his historical designation, was originally given him in contempt and derision. He was very small of stature in respect to height, but his gluttony and sensuality had made him immensely corpulent in body, so that he looked more like a monster than a man. The term Physcon was a Greek word, which denoted opprobriously the ridiculous figure that he made.

The circumstances of Ptolemy Physcon's accession to the throne afford not only a striking illustration of his character, but a very faithful though terrible picture of the manners and morals of the times. He had been engaged in a long and cruel war with his brother, who was king before him, in which war he had perpetrated all imaginable atrocities, when at length his brother died, leaving as his survivors his wife, who was also his sister, and a son who was yet a child. This son was properly the heir to the crown.

Physcon himself, being a brother, had no claim, as against a son. The name of the queen was Cleopatra. This was, in fact, a very common name among the princesses of the Ptolemaic line. Cleopatra, besides her son, had a daughter, who was at this time a young and beautiful girl. Her name was also Cleopatra. She was, of course, the niece, as her mother was the sister, of Physcon.

The plan of Cleopatra the mother, after her husband's death, was to make her son the king of Egypt, and to govern herself, as regent, until he should become of age. The friends and adherents of Physcon, however, formed a strong party in _his_ favor. They sent for him to come to Alexandria to assert his claims to the throne. He came, and a new civil war was on the point of breaking out between the brother and sister, when at length the dispute was settled by a treaty, in which it was stipulated that Physcon should marry Cleopatra, and be king; but that he should make the son of Cleopatra by her former husband his heir. This treaty was carried into effect so far as the celebration of the marriage with the mother was concerned, and the establishment of Physcon upon the throne. But the perfidious monster, instead of keeping his faith in respect to the boy, determined to murder him; and so open and brutal were his habits of violence and cruelty, that he undertook to perpetrate the deed himself, in open day. The boy fled shrieking to the mother's arms for protection, and Physcon stabbed and killed him there, exhibiting the spectacle of a newly-married husband murdering the son of his wife in her very arms!

It is easy to conceive what sort of affection would exist between a husband and a wife after such transactions as these. In fact, there had been no love between them from the beginning. The marriage had been solely a political arrangement. Physcon hated his wife, and had murdered her son, and then, as if to complete the exhibition of the brutal lawlessness and capriciousness of his passions, he ended with falling in love with her daughter. The beautiful girl looked upon this heartless monster, as ugly and deformed in body as he was in mind, with absolute horror. But she was wholly in his power. He compelled her, by violence, to submit to his will. He repudiated the mother, and forced the daughter to become his wife.

Physcon displayed the same qualities of brutal tyranny and cruelty in the treatment of his subjects that he manifested in his own domestic relations. The particulars we can not here give, but can only say that his atrocities became at length absolutely intolerable, and a revolt so formidable broke out, that he fled from the country. In fact, he barely escaped with his life, as the mob had surrounded the palace and were setting it on fire, intending to burn the tyrant himself and all the accomplices of his crimes together. Physcon, however, contrived to make his escape. He fled to the island of Cyprus, taking with him a certain beautiful boy, his son by the Cleopatra whom he had divorced; for they had been married long enough, before the divorce, to have a son. The name of this boy was Memphitis. His mother was very tenderly attached to him, and Physcon took him away on this very account, to keep him as a hostage for his mother's good behavior. He fancied that, when he was gone, she might possibly attempt to resume possession of the throne.

His expectations in this respect were realized. The people of Alexandria rallied around Cleopatra, and called upon her to take the crown. She did so, feeling, perhaps, some misgivings in respect to the danger which such a step might possibly bring upon her absent boy. She quieted herself, however, by the thought that he was in the hands of his own father, and that he could not possibly come to harm.

After some little time had elapsed, and Cleopatra was beginning to be well established in her possession of the supreme power at Alexandria, her birth-day approached, and arrangements were made for celebrating it in the most magnificent manner. When the day arrived, the whole city was given up to festivities and rejoicing. Grand entertainments were given in the palace, and games, spectacles, and plays in every variety, were exhibited and performed in all quarters of the city. Cleopatra herself was enjoying a magnificent entertainment, given to the lords and ladies of the court and the officers of her army, in one of the royal palaces.

[Illustration: THE BIRTH-DAY PRESENT.]

In the midst of this scene of festivity and pleasure, it was announced to the queen that a large box had arrived for her. The box was brought into the apartment. It had the appearance of containing some magnificent present, sent in at that time by some friend in honor of the occasion. The curiosity of the queen was excited to know what the mysterious coffer might contain. She ordered it to be opened; and the guests gathered around, each eager to obtain the first glimpse of the contents. The lid was removed, and a cloth beneath it was raised, when, to the unutterable horror of all who witnessed the spectacle, there was seen the head and hands of Cleopatra's beautiful boy, lying among masses of human flesh, which consisted of the rest of his body cut into pieces. The head had been left entire, that the wretched mother might recognize in the pale and lifeless features the countenance of her son. Physcon had sent the box to Alexandria, with orders that it should be retained until the evening of the birth-day, and then presented publicly to Cleopatra in the midst of the festivities of the scene. The shrieks and cries with which she filled the apartments of the

palace at the first sight of the dreadful spectacle, and the agony of long-continued and inconsolable grief which followed, showed how well the cruel contrivance of the tyrant was fitted to accomplish its end.

It gives us no pleasure to write, and we are sure it can give our readers no pleasure to peruse, such shocking stories of bloody cruelty as these. It is necessary, however, to a just appreciation of the character of the great subject of this history, that we should understand the nature of the domestic influences that reigned in the family from which she sprung. In fact, it is due, as a matter of simple justice to her, that we should know what these influences were, and what were the examples set before her in her early life; since the privileges and advantages which the young enjoy in their early years, and, on the other hand, the evil influences under which they suffer, are to be taken very seriously into the account when we are passing judgment upon the follies and sins into which they subsequently fall.

The monster Physcon lived, it is true, two or three generations before the great Cleopatra; but the character of the intermediate generations, until the time of her birth, continued much the same. In fact, the cruelty, corruption, and vice which reigned in every branch of the royal family increased rather than diminished. The beautiful niece of Physcon, who, at the time of her compulsory marriage with him, evinced such an aversion to the monster, had become, at the period of her husband's death, as great a monster of ambition, selfishness, and cruelty as he. She had two sons, Lathyrus and Alexander. Physcon, when he died, left the kingdom of Egypt to her by will, authorizing her to associate with her in the government whichever of these two sons she might choose. The oldest was best entitled to this privilege, by his priority of birth; but she preferred the youngest, as she thought that her own power would be more absolute in reigning in conjunction with him, since he would be more completely under her control. The leading powers, however, in Alexandria, resisted this plan, and insisted on Cleopatra's associating her oldest son, Lathyrus, with her in the government of the realm. They compelled her to recall Lathyrus from the banishment into which she had sent him, and to put him nominally upon the throne. Cleopatra yielded to this necessity, but she forced her son to repudiate his wife, and to take, instead, another woman, whom she fancied she could make more subservient to her will. The mother and the son went on together for a time, Lathyrus being nominally king, though her determination that she would rule, and his struggles to resist her intolerable tyranny, made their wretched household the scene of terrible and perpetual quarrels. At last Cleopatra seized a number of Lathyrus's servants, the eunuchs who were employed in various offices about the palace, and after wounding and mutilating them in a horrible manner, she exhibited them to the populace, saying that it was Lathyrus that had inflicted the cruel injuries upon the sufferers, and calling upon them to arise and punish him for his crimes. In this and in other similar ways she awakened among the people of the court and of the city such an animosity against Lathyrus, that they expelled him from the country. There followed a long series of cruel and bloody wars between the mother and the son, in the course of which each party perpetrated against the other almost every imaginable deed of atrocity and crime. Alexander, the youngest son, was so afraid of his terrible mother, that he did not dare to remain in Alexandria with her, but went into a sort of banishment of his own accord. He, however, finally returned to Egypt. His mother immediately supposed that he was intending to disturb her possession of power, and resolved to destroy him. He became acquainted with her designs, and, grown desperate by the long-continued pressure of her intolerable tyranny, he resolved to bring the anxiety and terror in which he lived to an end by killing her. This he did, and then fled the country. Lathyrus, his brother, then returned, and reigned for the rest of his days in a tolerable degree of quietness and peace. At length Lathyrus died, and left the kingdom to his son, Ptolemy Auletes, who was the great Cleopatra's father.

We can not soften the picture which is exhibited to our view in the history of this celebrated family, by regarding the mother of Auletes, in the masculine and merciless traits and principles which she displayed so energetically throughout her terrible career, as an exception to the general character of the princesses who appeared from time to time in the line. In ambition, selfishness, unnatural and reckless cruelty, and utter disregard of every virtuous principle and of every domestic tie, she was but the type and representative of all the rest.

She had two daughters, for example, who were the consistent and worthy followers of such a mother. A passage in the lives of these sisters illustrates very forcibly the kind of sisterly affection which prevailed in the family of the Ptolemies. The case was this:

There were two princes of Syria, a country lying northeast of the Mediterranean Sea, and so not very far from Egypt, who, though they were brothers, were in a state of most deadly hostility to each other. One had attempted to poison the other, and afterward a war had broken out between them, and all Syria was suffering from the ravages of their armies. One of the sisters, of whom we have been speaking, married one of these princes. Her name was Tryphena. After some time, but yet while the unnatural war was still raging between the two brothers, Cleopatra, the other sister--the same Cleopatra, in fact, that had been divorced from Lathyrus at the instance of his mother--espoused the other brother. Tryphena was exceedingly incensed against Cleopatra for marrying her husband's mortal foe, and the implacable hostility and hate of the sisters was thenceforth added to that which the brothers had

before exhibited, to complete the display of unnatural and parricidal passion which this shameful contest presented to the world.

In fact, Tryphena from this time seemed to feel a new and highly-excited interest in the contest, from her eager desire to revenge herself on her sister. She watched the progress of it, and took an active part in pressing forward the active prosecution of the war. The party of her husband, either from this or some other causes, seemed to be gaining the day. The husband of Cleopatra was driven from one part of the country to another, and at length, in order to provide for the security of his wife, he left her in Antioch, a large and strongly-fortified city, where he supposed that she would be safe, while he himself was engaged in prosecuting the war in other quarters where his presence seemed to be required.

On learning that her sister was at Antioch, Tryphena urged her husband to attack the place. He accordingly advanced with a strong detachment of the army, and besieged and took the city. Cleopatra would, of course, have fallen into his hands as a captive; but, to escape this fate, she fled to a temple for refuge. A temple was considered, in those days, an inviolable sanctuary. The soldiers accordingly left her there. Tryphena, however, made a request that her husband would deliver the unhappy fugitive into her hands. She was determined, she said, to kill her. Her husband remonstrated with her against this atrocious proposal. "It would be a wholly useless act of cruelty," said he, "to destroy her life. She can do us no possible harm in the future progress of the war, while to murder her under these circumstances will only exasperate her husband and her friends, and nerve them with new strength for the remainder of the contest. And then, besides, she has taken refuge in a temple; and if we violate that sanctuary, we shall incur, by such an act of sacrilege, the implacable displeasure of heaven. Consider, too, that she is your sister, and for you to kill her would be to commit an unnatural and wholly inexcusable crime."

So saying, he commanded Tryphena to say no more upon the subject, for he would on no account consent that Cleopatra should suffer any injury whatever.

This refusal on the part of her husband to comply with her request only inflamed Tryphena's insane resentment and anger the more. In fact, the earnestness with which he espoused her sister's cause, and the interest which he seemed to feel in her fate, aroused Tryphena's jealousy. She believed, or pretended to believe, that her husband was influenced by a sentiment of love in so warmly defending her. The object of her hate, from being simply an enemy, became now, in her view, a rival, and she resolved that, at all hazards, she should be destroyed. She accordingly ordered a body of desperate soldiers to break into the temple and seize her. Cleopatra fled in terror to the altar, and clung to it with such convulsive force that the soldiers cut her hands off before they could tear her away, and then, maddened by her resistance and the sight of blood, they stabbed her again and again upon the floor of the temple, where she fell. The appalling shrieks with which the wretched victim filled the air in the first moments of her flight and her terror, subsided, as her life ebbed away, into the most awful imprecations of the judgments of heaven upon the head of the unnatural sister whose implacable hate had destroyed her.

* * * * *

Notwithstanding the specimens that we have thus given of the character and action of this extraordinary family, the government of this dynasty, extending, as it did, through the reigns of thirteen sovereigns and over a period of nearly three hundred years, has always been considered one of the most liberal, enlightened, and prosperous of all the governments of ancient times. We shall have something to say in the next chapter in respect to the internal condition of the country while these violent men were upon the throne. In the meantime, we will here only add, that whoever is inclined, in observing the ambition, the selfishness, the party spirit, the unworthy intrigues, and the irregularities of moral conduct, which modern rulers and statesmen sometimes exhibit to mankind in their personal and political career, to believe in a retrogression and degeneracy of national character as the world advances in age, will be very effectually undeceived by reading attentively a full history of this celebrated dynasty, and reflecting, as he reads, that the narrative presents, on the whole, a fair and honest exhibition of the general character of the men by whom, in ancient times, the world was governed.

CHAPTER III.

ALEXANDRIA.

It must not be imagined by the reader that the scenes of vicious indulgence, and reckless cruelty and crime, which were exhibited with such dreadful frequency, and carried to such an enormous excess in the palaces of the Egyptian kings, prevailed to the same extent throughout the mass of the community during the period of their reign. The internal administration of government, and the institutions by which the industrial pursuits of the mass of the people were regulated, and peace and order preserved, and justice

enforced between man and man, were all this time in the hands of men well qualified, on the whole, for the trusts committed to their charge, and in a good degree faithful in the performance of their duties; and thus the ordinary affairs of government, and the general routine of domestic and social life, went on, notwithstanding the profligacy of the kings, in a course of very tolerable peace, prosperity, and happiness. During every one of the three hundred years over which the history of the Ptolemies extends, the whole length and breadth of the land of Egypt exhibited, with comparatively few interruptions, one wide-spread scene of busy industry. The inundations came at their appointed season, and then regularly retired. The boundless fields which the waters had fertilized were then every where tilled. The lands were plowed; the seed was sown; the canals and water-courses, which ramified from the river in every direction over the ground, were opened or closed, as the case required, to regulate the irrigation. The inhabitants were busy, and, consequently, they were virtuous. And as the sky of Egypt is seldom or never darkened by clouds and storms, the scene presented to the eye the same unchanging aspect of smiling verdure and beauty, day after day, and month after month, until the ripened grain was gathered into the store-houses, and the land was cleared for another inundation.

We say that the people were virtuous because they were busy; for there is no principle of political economy more fully established than that vice in the social state is the incident and symptom of idleness. It prevails always in those classes of every great population who are either released by the possession of fixed and unchangeable wealth from the necessity, or excluded by their poverty and degradation from the advantage, of useful employment. Wealth that is free, and subject to its possessor's control, so that he can, if he will, occupy himself in the management of it, while it sometimes may make individuals vicious, does not generally corrupt classes of men, for it does not make them idle. But wherever the institutions of a country are such as to create an aristocratic class, whose incomes depend on entailed estates, or on fixed and permanent annuities, so that the capital on which they live can not afford them any mental occupation, they are doomed necessarily to inaction and idleness. Vicious pleasures and indulgences are, with such a class as a whole, the inevitable result; for the innocent enjoyments of man are planned and designed by the Author of nature only for the intervals of rest and repose in a life of activity. They are always found wholly insufficient to satisfy one who makes pleasure the whole end and aim of his being.

In the same manner, if, either from the influence of the social institutions of a country, or from the operation of natural causes which human power is unable to control, there is a class of men too low, and degraded, and miserable to be reached by the ordinary inducements to daily toil, so certain are they to grow corrupt and depraved, that degradation has become in all languages a term almost synonymous with vice. There are many exceptions, it is true, to these general laws. Many active men are very wicked; and there have been frequent instances of the most exalted virtue among nobles and kings. Still, as a general law, it is unquestionably true that vice is the incident of idleness; and the sphere of vice, therefore, is at the top and at the bottom of society--those being the regions in which idleness reigns. The great remedy, too, for vice is employment. To make a community virtuous, it is essential that all ranks and gradations of it, from the highest to the lowest, should have something to do.

In accordance with these principles, we observe that, while the most extreme and abominable wickedness seemed to hold continual and absolute sway in the palaces of the Ptolemies, and among the nobles of their courts, the working ministers of state, and the men on whom the actual governmental functions devolved, discharged their duties with wisdom and fidelity, and throughout all the ordinary ranks and gradations of society there prevailed generally a very considerable degree of industry, prosperity, and happiness. This prosperity prevailed not only in the rural districts of the Delta and along the valley of the Nile, but also among the merchants, and navigators, and artisans of Alexandria.

Alexandria became, in fact, very soon after it was founded, a very great and busy city. Many things conspired to make it at once a great commercial emporium. In the first place, it was the depôt of export for all the surplus grain and other agricultural produce which was raised in such abundance along the Egyptian valley. This produce was brought down in boats to the upper point of the Delta, where the branches of the river divided, and thence down the Canopic branch to the city. The city was not, in fact, situated directly upon this branch, but upon a narrow tongue of land, at a little distance from it, near the sea. It was not easy to enter the channel directly, on account of the bars and sand-banks at its mouth, produced by the eternal conflict between the waters of the river and the surges of the sea. The water was deep, however, as Alexander's engineers had discovered, at the place where the city was built, and, by establishing the port there, and then cutting a canal across to the Nile, they were enabled to bring the river and the sea at once into easy communication.

The produce of the valley was thus brought down the river and through the canal to the city. Here immense warehouses and granaries were erected for its reception, that it might be safely preserved until the ships that came into the port were ready to take it away. These ships came from Syria, from all the coasts of Asia Minor, from Greece, and from Rome. They brought the agricultural productions of their own countries, as well as articles of manufacture of various kinds; these they sold to the merchants of

Alexandria, and purchased the productions of Egypt in return.

The port of Alexandria presented thus a constant picture of life and animation. Merchant ships were continually coming and going, or lying at anchor in the roadstead. Seamen were hoisting sails, or raising anchors, or rowing their capacious galleys through the water, singing, as they pulled, to the motion of the oars. Within the city there was the same ceaseless activity. Here groups of men were unloading the canal boats which had arrived from the river. There porters were transporting bales of merchandise or sacks of grain from a warehouse to a pier, or from one landing to another. The occasional parading of the king's guards, or the arrival and departure of ships of war to land or to take away bodies of armed men, were occurrences that sometimes intervened to interrupt, or as perhaps the people then would have said, to adorn this scene of useful industry; and now and then, for a brief period, these peaceful avocations would be wholly suspended and set aside by a revolt or by a civil war, waged by rival brothers against each other, or instigated by the conflicting claims of a mother and son. These interruptions, however, were comparatively few, and, in ordinary cases, not of long continuance. It was for the interest of all branches of the royal line to do as little injury as possible to the commercial and agricultural operations of the realm. In fact, it was on the prosperity of those operations that the revenues depended. The rulers were well aware of this, and so, however implacably two rival princes may have hated one another, and however desperately each party may have struggled to destroy all active combatants whom they should find in arms against them, they were both under every possible inducement to spare the private property and the lives of the peaceful population. This population, in fact, engaged thus in profitable industry, constituted, with the avails of their labors, the very estate for which the combatants were contending.

Seeing the subject in this light, the Egyptian sovereigns, especially Alexander and the earlier Ptolemies, made every effort in their power to promote the commercial greatness of Alexandria. They built palaces, it is true, but they also built warehouses. One of the most expensive and celebrated of all the edifices that they reared was the light-house which has been already alluded to. This light-house was a lofty tower, built of white marble. It was situated upon the island of Pharos, opposite to the city, and at some distance from it. There was a sort of isthmus of shoals and sand-bars connecting the island with the shore. Over these shallows a pier or causeway was built, which finally became a broad and inhabited neck. The principal part of the ancient city, however, was on the main land.[1]

The curvature of the earth requires that a light-house on a coast should have a considerable elevation, otherwise its summit would not appear above the horizon, unless the mariner were very near. To attain this elevation, the architects usually take advantage of some hill or cliff, or rocky eminence near the shore. There was, however, no opportunity to do this at Pharos; for the island was, like the main land, level and low. The requisite elevation could only be attained, therefore, by the masonry of an edifice, and the blocks of marble necessary for the work had to be brought from a great distance. The Alexandrian light-house was reared in the time of Ptolemy Philadelphus, the second monarch in the line. No pains or expense were spared in its construction. The edifice, when completed, was considered one of the seven wonders of the world. It was indebted for its fame, however, in some degree, undoubtedly to the conspicuousness of its situation, rising, as it did, at the entrance of the greatest commercial emporium of its time, and standing there, like a pillar of cloud by day and of fire by night, to attract the welcome gaze of every wandering mariner whose ship came within its horizon, and to awaken his gratitude by tendering him its guidance and dispelling his fears.

The light at the top of the tower was produced by a fire, made of such combustibles as would emit the brightest flame. This fire burned slowly through the day, and then was kindled up anew when the sun went down, and was continually replenished through the night with fresh supplies of fuel. In modern times, a much more convenient and economical mode is adopted to produce the requisite illumination. A great blazing lamp burns brilliantly in the center of the lantern of the tower, and all that part of the radiation from the flame which would naturally have beamed upward, or downward, or laterally, or back toward the land, is so turned by a curious system of reflectors and polyzonal lenses, most ingeniously contrived and very exactly adjusted, as to be thrown forward in one broad and thin, but brilliant sheet of light, which shoots out where its radiance is needed, over the surface of the sea. Before these inventions were perfected, far the largest portion of the light emitted by the illumination of light-house towers streamed away wastefully in landward directions, or was lost among the stars.

Of course, the glory of erecting such an edifice as the Pharos of Alexandria, and of maintaining it in the performance of its functions, was very great; the question might, however, very naturally arise whether this glory was justly due to the architect through whose scientific skill the work was actually accomplished, or to the monarch by whose power and resources the architect was sustained. The name of the architect was Sostratus. He was a Greek. The monarch was, as has already been stated, the second Ptolemy, called commonly Ptolemy Philadelphus. Ptolemy ordered that, in completing the tower, a marble tablet should be built into the wall, at a suitable place near the summit, and that a proper inscription should be carved upon it, with his name as the

builder of the edifice conspicuous thereon. Sostratus preferred inserting his own name. He accordingly made the tablet and set it in its place. He cut the inscription upon the face of it, in Greek characters, with his own name as the author of the work. He did this secretly, and then covered the face of the tablet with an artificial composition, made with lime, to imitate the natural surface of the stone. On this outer surface he cut a new inscription, in which he inserted the name of the king. In process of time the lime moldered away, the king's inscription disappeared, and his own, which thenceforward continued as long as the building endured, came out to view.

The Pharos was said to have been four hundred feet high. It was famed throughout the world for many centuries; nothing, however, remains of it now but a heap of useless and unmeaning ruins.

Besides the light that beamed from the summit of this lofty tower, there was another center of radiance and illumination in ancient Alexandria, which was in some respects still more conspicuous and renowned, namely, an immense library and museum established and maintained by the Ptolemies. The Museum, which was first established, was not, as its name might now imply, a collection of curiosities, but an institution of learning, consisting of a body of learned men, who devoted their time to philosophical and scientific pursuits. The institution was richly endowed, and magnificent buildings were erected for its use. The king who established it began immediately to make a collection of books for the use of the members of the institution. This was attended with great expense, as every book that was added to the collection required to be transcribed with a pen on parchment or papyrus, with infinite labor and care. Great numbers of scribes were constantly employed upon this work at the Museum. The kings who were most interested in forming this library would seize the books that were possessed by individual scholars, or that were deposited in the various cities of their dominions, and then, causing beautiful copies of them to be made by the scribes of the Museum, they would retain the originals for the great Alexandrian Library, and give the copies to the men or the cities that had been thus despoiled. In the same manner they would borrow, as they called it, from all travelers who visited Egypt, any valuable books which they might have in their possession, and, retaining the originals, give them back copies instead.

In process of time the library increased to four hundred thousand volumes. There was then no longer any room in the buildings of the Museum for further additions. There was, however, in another part of the city, a great temple called the Serapion. This temple was a very magnificent edifice, or, rather, group of edifices, dedicated to the god Serapis. The origin and history of this temple were very remarkable. The legend was this:

It seems that one of the ancient and long-venerated gods of the Egyptians was a deity named Serapis. He had been, among other divinities, the object of Egyptian adoration ages before Alexandria was built or the Ptolemies reigned. There was also, by a curious coincidence, a statue of the same name at a great commercial town named Sinope, which was built upon the extremity of a promontory which projected from Asia Minor into the Euxine Sea.[2] Sinope was, in some sense, the Alexandria of the north, being the center and seat of a great portion of the commerce of that quarter of the world.

The Serapis of Sinope was considered as the protecting deity of seamen, and the navigators who came and went to and from the city made sacrifices to him, and offered him oblations and prayers, believing that they were, in a great measure, dependent upon some mysterious and inscrutable power which he exercised for their safety in storms. They carried the knowledge of his name, and tales of his imaginary interpositions, to all the places that they visited; and thus the fame of the god became extended, first, to all the coasts of the Euxine Sea, and subsequently to distant provinces and kingdoms. The Serapis of Sinope began to be considered every where as the tutelar god of seamen.

Accordingly, when the first of the Ptolemies was forming his various plans for adorning and aggrandizing Alexandria, he received, he said, one night, a divine intimation in a dream that he was to obtain the statue of Serapis from Sinope, and set it up in Alexandria, in a suitable temple which he was in the mean time to erect in honor of the god. It is obvious that very great advantages to the city would result from the accomplishment of this design. In the first place, a temple to the god Serapis would be a new distinction for it in the minds of the rural population, who would undoubtedly suppose that the deity honored by it was their own ancient god. Then the whole maritime and nautical interest of the world, which had been accustomed to adore the god of Sinope, would turn to Alexandria as the great center of religious attraction, if their venerated idol could be carried and placed in a new and magnificent temple built expressly for him there. Alexandria could never be the chief naval port and station of the world, unless it contained the sanctuary and shrine of the god of seamen.

Ptolemy sent accordingly to the King of Sinope and proposed to purchase the idol. The embassage was, however, unsuccessful. The king refused to give up the god. The negotiations were continued for two years, but all in vain. At length, on account of some

failure in the regular course of the seasons on that coast, there was a famine there, which became finally so severe that the people of the city were induced to consent to give up their deity to the Egyptians in exchange for a supply of corn. Ptolemy sent the corn and received the idol. He then built the temple, which, when finished, surpassed in grandeur and magnificence almost every sacred structure in the world.

It was in this temple that the successive additions to the Alexandrian library were deposited, when the apartments at the Museum became full. In the end there were four hundred thousand rolls or volumes in the Museum, and three hundred thousand in the Serapion. The former was called the parent library, and the latter, being, as it were, the offspring of the first, was called the daughter.

Ptolemy Philadelphus, who interested himself very greatly in collecting this library, wished to make it a complete collection of all the books in the world. He employed scholars to read and study, and travelers to make extensive tours, for the purpose of learning what books existed among all the surrounding nations; and, when he learned of their existence, he spared no pains or expense in attempting to procure either the originals themselves, or the most perfect and authentic copies of them. He sent to Athens and obtained the works of the most celebrated Greek historians, and then causing, as in other cases, most beautiful transcripts to be made, he sent the transcripts back to Athens, and a very large sum of money with them as an equivalent for the difference of value between originals and copies in such an exchange.

In the course of the inquiries which Ptolemy made into the literature of the surrounding nations, in his search for accessions to his library, he heard that the Jews had certain sacred writings in their temple at Jerusalem, comprising a minute and extremely interesting history of their nation from the earliest periods, and also many other books of sacred prophecy and poetry. These books, which were, in fact, the Hebrew Scriptures of the Old Testament, were then wholly unknown to all nations except the Jews, and among the Jews were known only to priests and scholars. They were kept sacred at Jerusalem. The Jews would have considered them as profaned in being exhibited to the view of pagan nations. In fact, the learned men of other countries would not have been able to read them; for the Jews secluded themselves so closely from the rest of mankind, that their language was, in that age, scarcely ever heard beyond the confines of Judea and Galilee.

Ptolemy very naturally thought that a copy of these sacred books would be a great acquisition to his library. They constituted, in fact, the whole literature of a nation which was, in some respects, the most extraordinary that ever existed on the globe. Ptolemy conceived the idea, also, of not only adding to his library a copy of these writings in the original Hebrew, but of causing a translation of them to be made into Greek, so that they might easily be read by the Greek and Roman scholars who were drawn in great numbers to his capital by the libraries and the learned institutions which he had established there. The first thing to be effected, however, in accomplishing either of these plans, was to obtain the consent of the Jewish authorities. They would probably object to giving up any copy of their sacred writings at all.

There was one circumstance which led Ptolemy to imagine that the Jews would, at that time particularly, be averse to granting any request of such a nature coming from an Egyptian king, and that was, that during certain wars which had taken place in previous reigns, a considerable number of prisoners had been taken by the Egyptians, and had been brought to Egypt as captives, where they had been sold to the inhabitants, and were now scattered over the land as slaves. They were employed as servile laborers in tilling the fields, or in turning enormous wheels to pump up water from the Nile. The masters of these hapless bondmen conceived, like other slave-holders, that they had a right of property in their slaves. This was in some respects true, since they had bought them of the government at the close of the war for a consideration; and though they obviously derived from this circumstance no valid proprietary right or claim as against the men personally, it certainly would seem that it gave them a just claim against the government of whom they bought, in case of subsequent manumission.

Ptolemy or his minister, for it can not now be known who was the real actor in these transactions, determined on liberating these slaves and sending them back to their native land, as a means of propitiating the Jews and inclining them to listen favorably to the request which he was about to prefer for a copy of their sacred writings. He, however, paid to those who held the captives a very liberal sum for ransom. The ancient historians, who never allow the interest of their narratives to suffer for want of a proper amplification on their part of the scale on which the deeds which they record were performed, say that the number of slaves liberated on this occasion was a hundred and twenty thousand, and the sum paid for them, as compensation to the owners, was six hundred talents, equal to six hundred thousand dollars.[3] And yet this was only a preliminary expense to pave the way for the acquisition of a single series of books, to add to the variety of the immense collection.

After the liberation and return of the captives, Ptolemy sent a splendid embassage to Jerusalem, with very respectful letters to the high priest, and with very magnificent presents. The embassadors were received with the highest honors. The request of Ptolemy that he should be allowed to take a copy of the sacred books for his library was very readily granted.

The priests caused copies to be made of all the sacred writings. These copies were executed in the most magnificent style, and were splendidly illuminated with letters of gold. The Jewish government also, at Ptolemy's request, designated a company of Hebrew scholars, six from each tribe--men learned in both the Greek and Hebrew languages--to proceed to Alexandria, and there, at the Museum, to make a careful translation of the Hebrew books into Greek. As there were twelve tribes, and six translators chosen from each, there were seventy-two translators in all. They made their translation, and it was called the _Septuagint_, from the Latin _septuaginta duo_, which means seventy-two.

Although out of Judea there was no feeling of reverence for these Hebrew Scriptures as books of divine authority, there was still a strong interest felt in them as very entertaining and curious works of history, by all the Greek and Roman scholars who frequented Alexandria to study at the Museum. Copies were accordingly made of the Septuagint translation, and were taken to other countries; and there, in process of time, copies of the copies were made, until, at length the work became extensively circulated throughout the whole learned world. When, finally, Christianity became extended over the Roman empire, the priests and monks looked with even a stronger interest than the ancient scholars had felt upon this early translation of so important a portion of the sacred Scriptures. They made new copies for abbeys, monasteries, and colleges; and when, at length, the art of printing was discovered, this work was one of the first on which the magic power of typography was tried. The original manuscript made by the scribes of the seventy-two, and all the early transcripts which were made from it, have long since been lost or destroyed; but, instead of them, we have now hundreds of thousands of copies in compact printed volumes, scattered among the public and private libraries of Christendom. In fact, now, after the lapse of two thousand years, a copy of Ptolemy's Septuagint may be obtained of any considerable bookseller in any country of the civilized world; and though it required a national embassage, and an expenditure, if the accounts are true, of more than a million of dollars, originally to obtain it, it may be procured without difficulty now by two days' wages of an ordinary laborer.

Besides the building of the Pharos, the Museum, and the Temple of Serapis, the early Ptolemies formed and executed a great many other plans tending to the same ends which the erection of these splendid edifices was designed to secure, namely, to concentrate in Alexandria all possible means of attraction, commercial, literary, and religious, so as to make the city the great center of interest, and the common resort for all mankind. They raised immense revenues for these and other purposes by taxing heavily the whole agricultural produce of the valley of the Nile. The inundations, by the boundless fertility which they annually produced, supplied the royal treasuries. Thus the Abyssinian rains at the sources of the Nile built the Pharos at its mouth, and endowed the Alexandrian library.

The taxes laid upon the people of Egypt to supply the Ptolemies with funds were, in fact, so heavy, that only the bare means of subsistence were left to the mass of the agricultural population. In admiring the greatness and glory of the city, therefore, we must remember that there was a gloomy counterpart to its splendor in the very extended destitution and poverty to which the mass of the people were every where doomed. They lived in hamlets of wretched huts along the banks of the river, in order that the capital might be splendidly adorned with temples and palaces. They passed their lives in darkness and ignorance, that seven hundred thousand volumes of expensive manuscripts might be enrolled at the Museum for the use of foreign philosophers and scholars. The policy of the Ptolemies was, perhaps, on the whole, the best, for the general advancement and ultimate welfare of mankind, which could have been pursued in the age in which they lived and acted; but, in applauding the results which they attained, we must not wholly forget the cost which they incurred in attaining them. At the same cost, we could, at the present day, far surpass them. If the people of the United States will surrender the comforts and conveniences which they individually enjoy--if the farmers scattered in their comfortable homes on the hill-sides and plains throughout the land will give up their houses, their furniture, their carpets, their books, and the privileges of their children, and then--withholding from the produce of their annual toil only a sufficient reservation to sustain them and their families through the year, in a life like that of a beast of burden, spent in some miserable and naked hovel--send the rest to some hereditary sovereign residing upon the Atlantic sea-board, that he may build with the proceeds a splendid capital, they may have an Alexandria now that will infinitely exceed the ancient city of the Ptolemies in splendor and renown. The nation, too, would, in such a case, pay for its metropolis the same price, precisely, that the ancient Egyptians paid for theirs.

The Ptolemies expended the revenues which they raised by this taxation mainly in a very liberal and enlightened manner, for the accomplishment of the purposes which they had in view. The building of the Pharos, the removal of the statue of Serapis, and the

endowment of the Museum and the library were great conceptions, and they were carried into effect in the most complete and perfect manner. All the other operations which they devised and executed for the extension and aggrandizement of the city were conceived and executed in the same spirit of scientific and enlightened liberality. Streets were opened; the most splendid palaces were built; docks, piers, and breakwaters were constructed, and fortresses and towers were armed and garrisoned. Then every means was employed to attract to the city a great concourse from all the most highly-civilized nations then existing. The highest inducements were offered to merchants, mechanics, and artisans to make the city their abode. Poets, painters, sculptors, and scholars of every nation and degree were made welcome, and every facility was afforded them for the prosecution of their various pursuits. These plans were all eminently successful. Alexandria rose rapidly to the highest consideration and importance; and, at the time when Cleopatra--born to preside over this scene of magnificence and splendor--came upon the stage, the city had but one rival in the world. That rival was Rome.

CHAPTER IV.

CLEOPATRA'S FATHER.

When the time was approaching in which Cleopatra appeared upon the stage, Rome was perhaps the only city that could be considered as the rival of Alexandria, in the estimation of mankind, in respect to interest and attractiveness as a capital. In one respect, Rome was vastly superior to the Egyptian metropolis, and that was in the magnitude and extent of the military power which it wielded among the nations of the earth. Alexandria ruled over Egypt, and over a few of the neighboring coasts and islands; but in the course of the three centuries during which she had been acquiring her greatness and fame, the Roman empire had extended itself over almost the whole civilized world. Egypt had been, thus far, too remote to be directly reached; but the affairs of Egypt itself became involved at length with the operations of the Roman power, about the time of Cleopatra's birth, in a very striking and peculiar manner; and as the consequences of the transaction were the means of turning the whole course of the queen's subsequent history, a narration of it is necessary to a proper understanding of the circumstances under which she commenced her career. In fact, it was the extension of the Roman empire to the limits of Egypt, and the connections which thence arose between the leading Roman generals and the Egyptian sovereign, which have made the story of this particular queen so much more conspicuous, as an object of interest and attention to mankind, than that of any other one of the ten Cleopatras who rose successively in the same royal line.

Ptolemy Auletes, Cleopatra's father, was perhaps, in personal character, the most dissipated, degraded, and corrupt of all the sovereigns in the dynasty. He spent his whole time in vice and debauchery. The only honest accomplishment that he seemed to possess was his skill in playing upon the flute; of this he was very vain. He instituted musical contests, in which the musical performers of Alexandria played for prizes and crowns; and he himself was accustomed to enter the lists with the rest as a competitor. The people of Alexandria, and the world in general, considered such pursuits as these wholly unworthy the attention of the representative of so illustrious a line of sovereigns; and the abhorrence which they felt for the monarch's vices and crimes was mingled with a feeling of contempt for the meanness of his ambition.

There was a doubt in respect to his title to the crown, for his birth, on the mother's side, was irregular and ignoble. Instead, however, of attempting to confirm and secure his possession of power by a vigorous and prosperous administration of the government, he wholly abandoned all concern in respect to the course of public affairs; and then, to guard against the danger of being deposed, he conceived the plan of getting himself recognized at Rome as one of the allies of the Roman people. If this were once done, he supposed that the Roman government would feel under an obligation to sustain him on his throne in the event of any threatened danger.

The Roman government was a sort of republic, and the two most powerful men in the state at this time were Pompey and Cæsar. Cæsar was in the ascendency at Rome at the time that Ptolemy made his application for an alliance. Pompey was absent in Asia Minor, being engaged in prosecuting a war with Mithradates, a very powerful monarch, who was at that time resisting the Roman power. Cæsar was very deeply involved in debt, and was, moreover, very much in need of money, not only for relief from existing embarrassments, but as a means of subsequent expenditure, to enable him to accomplish certain great political schemes which he was entertaining. After many negotiations and delays, it was agreed that Cæsar would exert his influence to secure an alliance between the Roman people and Ptolemy, on condition that Ptolemy paid him the sum of six thousand talents, equal to about six millions of dollars. A part of the money, Cæsar said, was for Pompey.

The title of ally was conferred, and Ptolemy undertook to raise the money which he had promised by increasing the taxes of his kingdom. The measures, however, which he thus adopted for the purpose of making himself the more secure in his possession of the throne, proved to be the means of overthrowing him. The discontent and disaffection of his people, which had been strong and universal before, though suppressed and concealed, broke out now into open violence. That there should be laid upon them, in addition to all their other burdens, these new oppressions, heavier than those which they had endured before, and exacted for such a purpose too, was not to be endured. To be compelled to see their country sold on any terms to the Roman people was sufficiently hard to bear; but to be forced to raise, themselves, and pay the price of the transfer, was absolutely intolerable. Alexandria commenced a revolt. Ptolemy was not a man to act decidedly against such a demonstration, or, in fact, to evince either calmness or courage in any emergency whatever. His first thought was to escape from Alexandria to save his life. His second, to make the best of his way to Rome, to call upon the Roman people to come to the succor of their ally!

Ptolemy left five children behind him in his flight. The eldest was the Princess Berenice, who had already reached maturity. The second was the great Cleopatra, the subject of this history. Cleopatra was, at this time, about eleven years old. There were also two sons, but they were very young. One of them was named Ptolemy.

The Alexandrians determined on raising Berenice to the throne in her father's place, as soon as his flight was known. They thought that the sons were too young to attempt to reign in such an emergency, as it was very probable that Auletes, the father, would attempt to recover his kingdom. Berenice very readily accepted the honor and power which were offered to her. She established herself in her father's palace, and began her reign in great magnificence and splendor. In process of time she thought that her position would be strengthened by a marriage with a royal prince from some neighboring realm. She first sent embassadors to make proposals to a prince of Syria named Antiochus. The embassadors came back, bringing word that Antiochus was dead, but that he had a brother named Seleucus, upon whom the succession fell. Berenice then sent them back to make the same offers to him. He accepted the proposals, came to Egypt, and he and Berenice were married. After trying him for a while, Berenice found that, for some reason or other, she did not like him as a husband, and, accordingly, she caused him to be strangled.

At length, after various other intrigues and much secret management, Berenice succeeded in a second negotiation, and married a prince, or a pretended prince, from some country of Asia Minor, whose name was Archelaus. She was better pleased with this second husband than she had been with the first, and she began, at last, to feel somewhat settled and established on her throne, and to be prepared, as she thought, to offer effectual resistance to her father in case he should ever attempt to return.

It was in the midst of the scenes, and surrounded by the influences which might be expected to prevail in the families of such a father and such a sister, that Cleopatra spent those years of life in which the character is formed. During all these revolutions, and exposed to all these exhibitions of licentious wickedness, and of unnatural cruelty and crime, she was growing up in the royal palaces a spirited and beautiful, but indulged and neglected child.

In the mean time, Auletes, the father, went on toward Rome. So far as his character and his story were known among the surrounding nations, he was the object of universal obloquy, both on account of his previous career of degrading vice, and now, still more, for this ignoble flight from the difficulties in which his vices and crimes had involved him.

He stopped, on the way, at the island of Rhodes. It happened that Cato, the great Roman philosopher and general, was at Rhodes at this time. Cato was a man of stern, unbending virtue, and of great influence at that period in public affairs. Ptolemy sent a messenger to inform Cato of his arrival, supposing, of course, that the Roman general would hasten, on hearing of the fact, to pay his respects to so great a personage as he, a king of Egypt--a Ptolemy--though suffering under a temporary reverse of fortune. Cato directed the messenger to reply that, so far as he was aware, he had no particular business with Ptolemy. "Say, however, to the king," he added, "that, if he has any business with me, he may call and see me, if he pleases."

Ptolemy was obliged to suppress his resentment and submit. He thought it very essential to the success of his plans that he should see Cato, and secure, if possible, his interest and co-operation; and he consequently made preparations for paying, instead of receiving, the visit, intending to go in the greatest royal state that he could command. He accordingly appeared at Cato's lodgings on the following day, magnificently dressed, and accompanied by many attendants. Cato, who was dressed in the plainest and most simple manner, and whose apartment was furnished in a style corresponding with the severity of his character, did not even rise when the king entered the room. He simply pointed with his hand, and bade the visitor take a seat.

Ptolemy began to make a statement of his case, with a view to obtaining Cato's influence with the Roman people to induce them to interpose in his behalf. Cato, however, far from evincing any disposition to espouse his visitor's cause, censured him, in the plainest

terms, for having abandoned his proper position in his own kingdom, to go and make himself a victim and a prey for the insatiable avarice of the Roman leaders. "You can do nothing at Rome," he said, "but by the influence of bribes; and all the resources of Egypt will not be enough to satisfy the Roman greediness for money." He concluded by recommending him to go back to Alexandria, and rely for his hopes of extrication from the difficulties which surrounded him on the exercise of his own energy and resolution there.

Ptolemy was greatly abashed at this rebuff, but, on consultation with his attendants and followers, it was decided to be too late now to return. The whole party accordingly re-embarked on board their galleys, and pursued their way to Rome.

Ptolemy found, on his arrival at the city, that Cæsar was absent in Gaul, while Pompey, on the other hand, who had returned victorious from his campaigns against Mithradates, was now the great leader of influence and power at the Capitol. This change of circumstances was not, however, particularly unfavorable; for Ptolemy was on friendly terms with Pompey, as he had been with Cæsar. He had assisted him in his wars with Mithradates by sending him a squadron of horse, in pursuance of his policy of cultivating friendly relations with the Roman people by every means in his power. Besides, Pompey had received a part of the money which Ptolemy had paid to Cæsar as the price of the Roman alliance, and was to receive his share of the rest in case Ptolemy should ever be restored. Pompey was accordingly interested in favoring the royal fugitive's cause. He received him in his palace, entertained him in magnificent style, and took immediate measures for bringing his cause before the Roman senate, urging upon that body the adoption of immediate and vigorous measures for effecting his restoration, as an ally whom they were bound to protect against his rebellious subjects.

There was at first some opposition in the Roman senate against espousing the cause of such a man, but it was soon put down, being overpowered in part by Pompey's authority, and in part silenced by Ptolemy's promises and bribes. The senate determined to restore the king to his throne, and began to make arrangements for carrying the measure into effect.

The Roman provinces nearest to Egypt were Cilicia and Syria, countries situated on the eastern and northeastern coast of the Mediterranean Sea, north of Judea. The forces stationed in these provinces would be, of course, the most convenient for furnishing the necessary troops for the expedition. The province of Cilicia was under the command of the consul Lentulus. Lentulus was at this time at Rome; he had repaired to the capital for some temporary purpose, leaving his province and the troops stationed there under the command, for the time, of a sort of lieutenant general named Gabinius. It was concluded that this Lentulus, with his Syrian forces, should undertake the task of reinstating Ptolemy on his throne.

While these plans and arrangements were yet immature, a circumstance occurred which threatened, for a time, wholly to defeat them. It seems that when Cleopatra's father first left Egypt, he had caused a report to be circulated there that he had been killed in the revolt. The object of this stratagem was to cover and conceal his flight. The government of Berenice soon discovered the truth, and learned that the fugitive had gone in the direction of Rome. They immediately inferred that he was going to appeal to the Roman people for aid, and they determined that, if that were the case, the Roman people, before deciding in his favor, should have the opportunity to hear their side of the story as well as his. They accordingly made preparations at once for sending a very imposing embassage to Rome. The deputation consisted of more than a hundred persons. The object of Berenice's government in sending so large a number was not only to evince their respect for the Roman people, and their sense of the magnitude of the question at issue, but also to guard against any efforts that Ptolemy might make to intercept the embassage on the way, or to buy off the members of it by bribes. The number, however, large as it was, proved insufficient to accomplish this purpose. The whole Roman world was at this time in such a condition of disorder and violence, in the hands of the desperate and reckless military leaders who then bore sway, that there were every where abundant facilities for the commission of any conceivable crime. Ptolemy contrived, with the assistance of the fierce partisans who had espoused his cause, and who were deeply interested in his success on account of the rewards which were promised them, to waylay and destroy a large proportion of this company before they reached Rome. Some were assassinated; some were poisoned; some were tampered with and bought off by bribes. A small remnant reached Rome; but they were so intimidated by the dangers which surrounded them, that they did not dare to take any public action in respect to the business which had been committed to their charge. Ptolemy began to congratulate himself on having completely circumvented his daughter in her efforts to protect herself against his designs.

Instead of that, however, it soon proved that the effect of this atrocious treachery was exactly the contrary of what its perpetrators had expected. The knowledge of the facts became gradually extended among the people of Rome, and it awakened a universal indignation. The party who had been originally opposed to Ptolemy's cause seized the opportunity to renew their opposition; and they gained so much strength from the general odium which Ptolemy's crimes had awakened, that Pompey found it almost

impossible to sustain his cause.

At length the party opposed to Ptolemy found, or pretended to find, in certain sacred books, called the Sibylline Oracles, which were kept in the custody of the priests, and were supposed to contain prophetic intimations of the will of Heaven in respect to the conduct of public affairs, the following passage:

"_If a king of Egypt should apply to you for aid, treat him in a friendly manner, but do not furnish him with troops; for if you do, you will incur great danger._"

This made new difficulty for Ptolemy's friends. They attempted, at first, to evade this inspired injunction by denying the reality of it. There was no such passage to be found, they said. It was all an invention of their enemies. This point seems to have been overruled, and then they attempted to give the passage some other than the obvious interpretation. Finally, they maintained that, although it prohibited their furnishing Ptolemy himself with troops, it did not forbid their sending an armed force into Egypt under leaders of their own. _That_ they could certainly do; and then, when the rebellion was suppressed, and Berenice's government overthrown, they could invite Ptolemy to return to his kingdom and resume his crown in a peaceful manner. This, they alleged, would not be "furnishing him with troops," and, of course, would not be disobeying the oracle.

These attempts to evade the direction of the oracle on the part of Ptolemy's friends, only made the debates and dissensions between them and his enemies more violent than ever. Pompey made every effort in his power to aid Ptolemy's cause; but Lentulus, after long hesitation and delay, decided that it would not be safe for him to embark in it. At length, however, Gabinius, the lieutenant who commanded in Syria, was induced to undertake the enterprise. On certain promises which he received from Ptolemy, to be performed in case he succeeded, and with a certain encouragement, not very legal or regular, which Pompey gave him, in respect to the employment of the Roman troops under his command, he resolved to march to Egypt. His route, of course, would lay along the shores of the Mediterranean Sea, and through the desert, to Pelusium, which has already been mentioned as the frontier town on this side of Egypt. From Pelusium he was to march through the heart of the Delta to Alexandria, and, if successful in his invasion, overthrow the government of Berenice and Archelaus, and then, inviting Ptolemy to return, reinstate him on the throne.

In the prosecution of this dangerous enterprise, Gabinius relied strongly on the assistance of a very remarkable man, then his second in command, who afterward acted a very important part in the subsequent history of Cleopatra. His name was Mark Antony. Antony was born in Rome, of a very distinguished family, but his father died when he was very young, and being left subsequently much to himself, he became a very wild and dissolute young man. He wasted the property which his father had left him in folly and vice; and then going on desperately in the same career, he soon incurred enormous debts, and involved himself, in consequence, in inextricable difficulties. His creditors continually harassed him with importunities for money, and with suits at law to compel payments which he had no means of making. He was likewise incessantly pursued by the hostility of the many enemies that he had made in the city by his violence and his crimes. At length he absconded, and went to Greece.

Here Gabinius, when on his way to Syria, met him, and invited him to join his army rather than to remain where he was in idleness and destitution. Antony, who was as proud and lofty in spirit as he was degraded in morals and condition, refused to do this unless Gabinius would give him a command. Gabinius saw in the daring and reckless energy which Antony manifested the indications of the class of qualities which in those days made a successful soldier, and acceded to his terms. He gave him the command of his cavalry. Antony distinguished himself in the Syrian campaigns that followed, and was now full of eagerness to engage in this Egyptian enterprise. In fact, it was mainly his zeal and enthusiasm to embark in the undertaking which was the means of deciding Gabinius to consent to Ptolemy's proposals.

The danger and difficulty which they considered as most to be apprehended in the whole expedition was the getting across the desert to Pelusium. In fact, the great protection of Egypt had always been her isolation. The trackless and desolate sands, being wholly destitute of water, and utterly void, could be traversed, even by a caravan of peaceful travelers, only with great difficulty and danger. For an army to attempt to cross them, exposed, as the troops would necessarily be, to the assaults of enemies who might advance to meet them on the way, and sure of encountering a terrible opposition from fresh and vigorous bands when they should arrive--wayworn and exhausted by the physical hardships of the way--at the borders of the inhabited country, was a desperate undertaking. Many instances occurred in ancient times in which vast bodies of troops, in attempting marches over the deserts by which Egypt was surrounded, were wholly destroyed by famine or thirst, or overwhelmed by storms of sand.[4]

These difficulties and dangers, however, did not at all intimidate Mark Antony. The anticipation, in fact, of the glory of surmounting them was one of the main inducements which led him to embark in the enterprise. The perils of the desert constituted one of the charms which made the expedition so attractive. He placed himself, therefore, at the head of his troop of cavalry, and set off across the sands in advance of Gabinius, to take Pelusium, in order thus to open a way for the main body of the army into Egypt. Ptolemy accompanied Antony. Gabinius was to follow.

With all his faults, to call them by no severer name, Mark Antony possessed certain great excellences of character. He was ardent, but then he was cool, collected, and sagacious; and there was a certain frank and manly generosity continually evincing itself in his conduct and character which made him a great favorite among his men. He was at this time about twenty-eight years old, of a tall and manly form, and of an expressive and intellectual cast of countenance. His forehead was high, his nose aquiline, and his eyes full of vivacity and life. He was accustomed to dress in a very plain and careless manner, and he assumed an air of the utmost familiarity and freedom in his intercourse with his soldiers. He would join them in their sports, joke with them, and good-naturedly receive their jokes in return; and take his meals, standing with them around their rude tables, in the open field. Such habits of intercourse with his men in a commander of ordinary character would have been fatal to his ascendency over them; but in Mark Antony's case, these frank and familiar manners seemed only to make the military genius and the intellectual power which he possessed the more conspicuous and the more universally admired.

Antony conducted his troop of horsemen across the desert in a very safe and speedy manner, and arrived before Pelusium. The city was not prepared to resist him. It surrendered at once, and the whole garrison fell into his hands as prisoners of war. Ptolemy demanded that they should all be immediately killed. They were rebels, he said, and, as such, ought to be put to death. Antony, however, as might have been expected from his character, absolutely refused to allow of any such barbarity. Ptolemy, since the power was not yet in his hands, was compelled to submit, and to postpone gratifying the spirit of vengeance which had so long been slumbering in his breast to a future day. He could the more patiently submit to this necessity, since it appeared that the day of his complete and final triumph over his daughter and all her adherents was now very nigh at hand.

[Illustration: ANTONY CROSSING THE DESERT.]

In fact, Berenice and her government, when they heard of the arrival of Antony and Ptolemy at Pelusium, of the fall of that city, and of the approach of Gabinius with an overwhelming force of Roman soldiers, were struck with dismay. Archelaus, the husband of Berenice, had been, in former years, a personal friend of Antony's. Antony considered, in fact, that they were friends still, though required by what the historian calls their duty to fight each other for the possession of the kingdom. The government of Berenice raised an army. Archelaus took command of it, and advanced to meet the enemy. In the mean time, Gabinius arrived with the main body of the Roman troops, and commenced his march, in conjunction with Antony, toward the capital. As they were obliged to make a circuit to the southward, in order to avoid the inlets and lagoons which, on the northern coast of Egypt, penetrate for some distance into the land, their course led them through the heart of the Delta. Many battles were fought, the Romans every where gaining the victory. The Egyptian soldiers were, in fact, discontented and mutinous, perhaps, in part, because they considered the government on the side of which they were compelled to engage as, after all, a usurpation. At length a great final battle was fought, which settled the controversy. Archelaus was slain upon the field, and Berenice was taken prisoner; their government was wholly overthrown, and the way was opened for the march of the Roman armies to Alexandria.

Mark Antony, when judged by our standards, was certainly, as well as Ptolemy, a depraved and vicious man; but his depravity was of a very different type from that of Cleopatra's father. The difference in the men, in one respect, was very clearly evinced by the objects toward which their interest and attention were respectively turned after this great battle. While the contest had been going on, the king and queen of Egypt, Archelaus and Berenice, were, of course, in the view both of Antony and Ptolemy, the two most conspicuous personages in the army of their enemies; and while Antony would naturally watch with the greatest interest the fate of his friend, the king, Ptolemy, would as naturally follow with the highest concern the destiny of his daughter. Accordingly, when the battle was over, while the mind of Ptolemy might, as we should naturally expect, be chiefly occupied by the fact that his _daughter_ was made a captive, Antony's, we might suppose, would be engrossed by the tidings that his _friend_ had been slain.

The one rejoiced and the other mourned. Antony sought for the body of his friend on the field of battle, and when it was found, he gave himself wholly to the work of providing for it a most magnificent burial. He seemed, at the funeral, to lament the death of his ancient comrade with real and unaffected grief. Ptolemy, on the other hand, was overwhelmed with joy at finding his daughter his captive. The long-wished-for hour for the gratification of his revenge had come at last, and the first use which he made of his power when he was put in possession of it at Alexandria was to order his daughter to be beheaded.

CHAPTER V.

ACCESSION TO THE THRONE.

At the time when the unnatural quarrel between Cleopatra's father and her sister was working its way toward its dreadful termination, as related in the last chapter, she herself was residing at the royal palace in Alexandria, a blooming and beautiful girl of about fifteen. Fortunately for her, she was too young to take any active part personally in the contention. Her two brothers were still younger than herself. They all three remained, therefore, in the royal palaces, quiet spectators of the revolution, without being either benefited or injured by it. It is singular that the name of both the boys was Ptolemy.

The excitement in the city of Alexandria was intense and universal when the Roman army entered it to reinstate Cleopatra's father upon his throne. A very large portion of the inhabitants were pleased with having the former king restored. In fact, it appears, by a retrospect of the history of kings, that when a legitimate hereditary sovereign or dynasty is deposed and expelled by a rebellious population, no matter how intolerable may have been the tyranny, or how atrocious the crimes by which the patience of the subject was exhausted, the lapse of a very few years is ordinarily sufficient to produce a very general readiness to acquiesce in a restoration; and in this particular instance there had been no such superiority in the government of Berenice, during the period while her power continued, over that of her father, which she had displaced, as to make this case an exception to the general rule. The mass of the people, therefore--all those, especially, who had taken no active part in Berenice's government--were ready to welcome Ptolemy back to his capital. Those who had taken such a part were all summarily executed by Ptolemy's orders.

There was, of course, a great excitement throughout the city on the arrival of the Roman army. All the foreign influence and power which had been exercised in Egypt thus far, and almost all the officers, whether civil or military, had been Greek. The coming of the Romans was the introduction of a new element of interest to add to the endless variety of excitements which animated the capital.

The restoration of Ptolemy was celebrated with games, spectacles, and festivities of every kind, and, of course, next to the king himself, the chief center of interest and attraction in all these public rejoicings would be the distinguished foreign generals by whose instrumentality the end had been gained.

Mark Antony was a special object of public regard and admiration at the time. His eccentric manners, his frank and honest air, his Roman simplicity of dress and demeanor, made him conspicuous; and his interposition to save the lives of the captured garrison of Pelusium, and the interest which he took in rendering such distinguished funeral honors to the enemy whom his army had slain in battle, impressed the people with the idea of a certain nobleness and magnanimity in his character, which, in spite of his faults, made him an object of general admiration and applause. The very faults of such a man assume often, in the eyes of the world, the guise and semblance of virtues. For example, it is related of Antony that, at one time in the course of his life, having a desire to make a present of some kind to a certain person, in requital for a favor which he had received from him, he ordered his treasurer to send a sum of money to his friend--and named for the sum to be sent an amount considerably greater than was really required under the circumstances of the case--acting thus, as he often did, under the influence of a blind and uncalculating generosity. The treasurer, more prudent than his master, wished to reduce the amount, but he did not dare directly to propose a reduction; so he counted out the money, and laid it in a pile in a place where Antony was to pass, thinking that when Antony saw the amount, he would perceive that it was too great. Antony, in passing by, asked what money that was. The treasurer said that it was the sum that he had ordered to be sent as a present to such a person, naming the individual intended. Antony was quick to perceive the object of the treasurer's maneuver. He immediately replied, "Ah! is that all? I thought the sum I named would make a better appearance than that; send him double the amount."

To determine, under such circumstances as these, to double an extravagance merely for the purpose of thwarting the honest attempt of a faithful servant to diminish it, made, too, in so cautious and delicate a way, is most certainly a fault. But it is one of those faults for which the world, in all ages, will persist in admiring and praising the perpetrator.

In a word, Antony became the object of general attention and favor during his continuance at Alexandria. Whether he particularly attracted Cleopatra's attention at this time or not does not appear. She, however, strongly attracted _his_. He admired her blooming beauty, her sprightliness and wit, and her various accomplishments. She was still, however, so young--being but fifteen years of age, while Antony was nearly thirty--that she probably made no very serious impression upon him. A short time after this, Antony went back to Rome, and did not see Cleopatra again for many years.

When the two Roman generals went away from Alexandria, they left a considerable portion of the army behind them, under Ptolemy's command, to aid him in keeping possession of his throne. Antony returned to Rome. He had acquired great renown by his march across the desert, and by the successful accomplishment of the invasion of Egypt and the restoration of Ptolemy. His funds, too, were replenished by the vast sums paid to him and to Gabinius by Ptolemy. The amount which Ptolemy is said to have agreed to pay as the price of his restoration was two thousand talents--equal to ten millions of dollars--a sum which shows on how great a scale the operations of this celebrated campaign were conducted. Ptolemy raised a large portion of the money required for his payments by confiscating the estates belonging to those friends of Berenice's government whom he ordered to be slain. It was said, in fact, that the numbers were very much increased of those that were condemned to die, by Ptolemy's standing in such urgent need of their property to meet his obligations.

Antony, through the results of this campaign, found himself suddenly raised from the position of a disgraced and homeless fugitive to that of one of the most wealthy and renowned, and, consequently, one of the most powerful personages in Rome. The great civil war broke out about this time between Cæsar and Pompey. Antony espoused the cause of Cæsar.

In the mean time, while the civil war between Cæsar and Pompey was raging, Ptolemy succeeded in maintaining his seat on the throne, by the aid of the Roman soldiers whom Antony and Gabinius had left him, for about three years. When he found himself drawing toward the close of life, the question arose to his mind to whom he should leave his kingdom. Cleopatra was the oldest child, and she was a princess of great promise, both in respect to mental endowments and personal charms. Her brothers were considerably younger than she. The claim of a son, though younger, seemed to be naturally stronger than that of a daughter; but the commanding talents and rising influence of Cleopatra appeared to make it doubtful whether it would be safe to pass her by. The father settled the question in the way in which such difficulties were usually surmounted in the Ptolemy family. He ordained that Cleopatra should marry the oldest of her brothers, and that they two should jointly occupy the throne. Adhering also, still, to the idea of the alliance of Egypt with Rome, which had been the leading principle of the whole policy of his reign, he solemnly committed the execution of his will and the guardianship of his children, by a provision of the instrument itself, to the Roman senate. The senate accepted the appointment, and appointed Pompey as the agent, on their part, to perform the duties of the trust. The attention of Pompey was, immediately after that time, too much engrossed by the civil war waged between himself and Cæsar, to take any active steps in respect to the duties of his appointment. It seemed, however, that none were necessary, for all parties in Alexandria appeared disposed, after the death of the king, to acquiesce in the arrangements which he had made, and to join in carrying them into effect. Cleopatra was married to her brother--yet, it is true, only a boy. He was about ten years old. She was herself about eighteen. They were both too young to govern; they could only reign. The affairs of the kingdom were, accordingly, conducted by two ministers whom their father had designated. These ministers were Pothinus, a eunuch, who was a sort of secretary of state, and Achillas, the commander-in-chief of the armies.

Thus, though Cleopatra, by these events, became nominally a queen, her real accession to the throne was not yet accomplished. There were still many difficulties and dangers to be passed through, before the period arrived when she became really a sovereign. She did not, herself, make any immediate attempt to hasten this period, but seems to have acquiesced, on the other hand, very quietly, for a time, in the arrangements which her father had made.

Pothinus was a eunuch. He had been, for a long time, an officer of government under Ptolemy, the father. He was a proud, ambitious, and domineering man, determined to rule, and very unscrupulous in respect to the means which he adopted to accomplish his ends. He had been accustomed to regard Cleopatra as a mere child. Now that she was queen, he was very unwilling that the real power should pass into her hands. The jealousy and ill will which he felt toward her increased rapidly as he found, in the course of the first two or three years after her father's death, that she was advancing rapidly in strength of character, and in the influence and ascendency which she was acquiring over all around her. Her beauty, her accomplishments, and a certain indescribable charm which pervaded all her demeanor, combined to give her great personal power. But, while these things awakened in other minds feelings of interest in Cleopatra and attachment to her, they only increased the jealousy and envy of Pothinus. Cleopatra was becoming his rival. He endeavored to thwart and circumvent her. He acted toward her in a haughty and overbearing manner, in order to keep her down to what he considered her proper place as his ward; for he was yet the guardian both of Cleopatra and her husband, and the regent of the realm.

Cleopatra had a great deal of what is sometimes called spirit, and her resentment was aroused by this treatment. Pothinus took pains to enlist her young husband, Ptolemy, on his side, as the quarrel advanced. Ptolemy was younger, and of a character much less marked and decided than Cleopatra. Pothinus saw that he could maintain control over him much more easily and for a much longer time than over Cleopatra. He contrived to awaken the young Ptolemy's jealousy of his wife's rising influence, and to induce

him to join in efforts to thwart and counteract it. These attempts to turn her husband against her only aroused Cleopatra's resentment the more. Hers was not a spirit to be coerced. The palace was filled with the dissensions of the rivals. Pothinus and Ptolemy began to take measures for securing the army on their side. An open rupture finally ensued, and Cleopatra was expelled from the kingdom.

She went to Syria. Syria was the nearest place of refuge, and then, besides, it was the country from which the aid had been furnished by which her father had been restored to the throne when he had been expelled, in a similar manner, many years before. Her father, it is true, had gone first to Rome; but the succors which he had negotiated for had been sent from Syria. Cleopatra hoped to obtain the same assistance by going directly there.

Nor was she disappointed. She obtained an army, and commenced her march toward Egypt, following the same track which Antony and Gabinius had pursued in coming to reinstate her father. Pothinus raised an army and went forth to meet her. He took Achillas as the commander of the troops, and the young Ptolemy as the nominal sovereign; while he, as the young king's guardian and prime minister, exercised the real power. The troops of Pothinus advanced to Pelusium. Here they met the forces of Cleopatra coming from the east. The armies encamped not very far from each other, and both sides began to prepare for battle.

The battle, however, was not fought. It was prevented by the occurrence of certain great and unforeseen events which at this crisis suddenly burst upon the scene of Egyptian history, and turned the whole current of affairs into new and unexpected channels. The breaking out of the civil war between the great Roman generals Cæsar and Pompey, and their respective partisans, has already been mentioned as having occurred soon after the death of Cleopatra's father, and as having prevented Pompey from undertaking the office of executor of the will. This war had been raging ever since that time with terrible fury. Its distant thundering had been heard even in Egypt, but it was too remote to awaken there any special alarm. The immense armies of these two mighty conquerors had moved slowly--like two ferocious birds of prey, flying through the air, and fighting as they fly--across Italy into Greece, and from Greece, through Macedon, into Thessaly, contending in dreadful struggles with each other as they advanced, and trampling down and destroying every thing in their way. At length a great final battle had been fought at Pharsalia. Pompey had been totally defeated. He had fled to the sea-shore, and there, with a few ships and a small number of followers, he had pushed out upon the Mediterranean, not knowing whither to fly, and overwhelmed with wretchedness and despair. Cæsar followed him in eager pursuit. He had a small fleet of galleys with him, on board of which he had embarked two or three thousand men. This was a force suitable, perhaps, for the pursuit of a fugitive, but wholly insufficient for any other design.

Pompey thought of Ptolemy. He remembered the efforts which he himself had made for the cause of Ptolemy Auletes, at Rome, and the success of those efforts in securing that monarch's restoration--an event through which alone the young Ptolemy had been enabled to attain the crown. He came, therefore, to Pelusium, and, anchoring his little fleet off the shore, sent to the land to ask Ptolemy to receive and protect him. Pothinus, who was really the commander in Ptolemy's army, made answer to this application that Pompey should be received and protected, and that he would send out a boat to bring him to the shore. Pompey felt some misgivings in respect to this proffered hospitality, but he finally concluded to go to the shore in the boat which Pothinus sent for him. As soon as he landed, the Egyptians, by Pothinus's orders, stabbed and beheaded him on the sand. Pothinus and his council had decided that this would be the safest course. If they were to receive Pompey, they reasoned, Cæsar would be made their enemy; if they refused to receive him, Pompey himself would be offended, and they did not know which of the two it would be safe to displease; for they did not know in what way, if both the generals were to be allowed to live, the war would ultimately end. "But by killing Pompey," they said, "we shall be sure to please Cæsar, and Pompey himself will _lie still_."

In the mean time, Cæsar, not knowing to what part of Egypt Pompey had fled, pressed on directly to Alexandria. He exposed himself to great danger in so doing, for the forces under his command were not sufficient to protect him in case of his becoming involved in difficulties with the authorities there. Nor could he, when once arrived on the Egyptian coast, easily go away again; for, at the season of the year in which these events occurred, there was a periodical wind which blew steadily toward that part of the coast, and, while it made it very easy for a fleet of ships to go to Alexandria, rendered it almost impossible for them to return.

Cæsar was very little accustomed to shrink from danger in any of his enterprises and plans, though still he was usually prudent and circumspect. In this instance, however, his ardent interest in the pursuit of Pompey overruled all considerations of personal safety. He arrived at Alexandria, but he found that Pompey was not there. He anchored his vessels in the port, landed his troops, and established himself in the city. These two events, the assassination of one of the great Roman generals on the eastern extremity of the coast, and the arrival of the other, at the same moment, at Alexandria, on the western, burst suddenly upon Egypt together, like simultaneous claps of thunder. The tidings struck the whole country with astonishment, and immediately engrossed universal

attention. At the camps both of Cleopatra and Ptolemy, at Pelusium, all was excitement and wonder. Instead of thinking of a battle, both parties were wholly occupied in speculating on the results which were likely to accrue, to one side or to the other, under the totally new and unexpected aspect which public affairs had assumed.

Of course the thoughts of all were turned toward Alexandria. Pothinus immediately proceeded to the city, taking with him the young king. Achillas, too, either accompanied them, or followed soon afterward. They carried with them the head of Pompey, which they had cut off on the shore where they had killed him, and also a seal which they took from his finger. When they arrived at Alexandria, they sent the head, wrapped up in a cloth, and also the seal, as presents to Cæsar. Accustomed as they were to the brutal deeds and heartless cruelties of the Ptolemies, they supposed that Cæsar would exult at the spectacle of the dissevered and ghastly head of his great rival and enemy. Instead of this, he was shocked and displeased, and ordered the head to be buried with the most solemn and imposing funeral ceremonies. He, however, accepted and kept the seal. The device engraved upon it was a lion holding a sword in his paw--a fit emblem of the characters of the men, who, though in many respects magnanimous and just, had filled the whole world with the terror of their quarrels.

The army of Ptolemy, while he himself and his immediate counselors went to Alexandria, was left at Pelusium, under the command of other officers, to watch Cleopatra. Cleopatra herself would have been pleased, also, to repair to Alexandria and appeal to Cæsar, if it had been in her power to do so; but she was beyond the confines of the country, with a powerful army of her enemies ready to intercept her on any attempt to enter or pass through it. She remained, therefore, at Pelusium, uncertain what to do.

In the mean time, Cæsar soon found himself in a somewhat embarrassing situation at Alexandria. He had been accustomed, for many years, to the possession and the exercise of the most absolute and despotic power, wherever he might be; and now that Pompey, his great rival, was dead, he considered himself the monarch and master of the world. He had not, however, at Alexandria, any means sufficient to maintain and enforce such pretensions, and yet he was not of a spirit to abate, on that account, in the slightest degree, the advancing of them. He established himself in the palaces of Alexandria as if he were himself the king. He moved, in state, through the streets of the city, at the head of his guards, and displaying the customary emblems of supreme authority used at Rome. He claimed the six thousand talents which Ptolemy Auletes had formerly promised him for procuring a treaty of alliance with Rome, and he called upon Pothinus to pay the balance due. He said, moreover, that by the will of Auletes the Roman people had been made the executor; and that it devolved upon him as the Roman consul, and, consequently, the representative of the Roman people, to assume that trust, and in the discharge of it to settle the dispute between Ptolemy and Cleopatra; and he called upon Ptolemy to prepare and lay before him a statement of his claims, and the grounds on which he maintained his right to the throne to the exclusion of Cleopatra.

On the other hand, Pothinus, who had been as little accustomed to acknowledge a superior as Cæsar, though his supremacy and domination had been exercised on a somewhat humbler scale, was obstinate and pertinacious in resisting all these demands, though the means and methods which he resorted to were of a character corresponding to his weak and ignoble mind. He fomented quarrels in the streets between the Alexandrian populace and Cæsar's soldiers. He thought that, as the number of troops under Cæsar's command in the city, and of vessels in the port, was small, he could tease and worry the Romans with impunity, though he had not the courage openly to attack them. He pretended to be a friend, or, at least, not an enemy, and yet he conducted toward them in an overbearing and insolent manner. He had agreed to make arrangements for supplying them with food, and he did this by procuring damaged provisions of a most wretched quality; and when the soldiers remonstrated, he said to them, that they who lived at other people's cost had no right to complain of their fare. He caused wooden and earthen vessels to be used in the palace, and said, in explanation, that he had been compelled to sell all the gold and silver plate of the royal household to meet the exactions of Cæsar. He busied himself, too, about the city, in endeavoring to excite odium against Cæsar's proposal to hear and decide the question at issue between Cleopatra and Ptolemy. Ptolemy was a sovereign, he said, and was not amenable to any foreign power whatever. Thus, without the courage or the energy to attempt any open, manly, and effectual system of hostility, he contented himself with making all the difficulty in his power, by urging an incessant pressure of petty, vexatious, and provoking, but useless annoyances. Cæsar's demands may have been unjust, but they were bold, manly, and undisguised. The eunuch may have been right in resisting them; but the mode was so mean and contemptible, that mankind have always taken part with Cæsar in the sentiments which they have formed as spectators of the contest.

With the very small force which Cæsar had at his command, and shut up as he was in the midst of a very great and powerful city, in which both the garrison and the population were growing more and more hostile to him every day, he soon found his situation was beginning to be attended with very serious danger. He could not retire from the scene. He probably would not have retired if he could have done so. He remained, therefore, in the city, conducting all the time with prudence and circumspection, but yet

maintaining, as at first, the same air of confident self-possession and superiority which always characterized his demeanor. He, however, dispatched a messenger forthwith into Syria, the nearest country under the Roman sway, with orders that several legions which were posted there should be embarked and forwarded to Alexandria with the utmost possible celerity.

CHAPTER VI.

CLEOPATRA AND CÆSAR.

In the mean time, while the events related in the last chapter were taking place at Alexandria, Cleopatra remained anxious and uneasy in her camp, quite uncertain, for a time, what it was best for her to do. She wished to be at Alexandria. She knew very well that Cæsar's power in controlling the course of affairs in Egypt would necessarily be supreme. She was, of course, very earnest in her desire to be able to present her cause before him. As it was, Ptolemy and Pothinus were in communication with the arbiter, and, for aught she knew, assiduously cultivating his favor, while she was far away, her cause unheard, her wrongs unknown, and perhaps even her existence forgotten. Of course, under such circumstances, she was very earnest to get to Alexandria.

But how to accomplish this purpose was a source of great perplexity. She could not march thither at the head of an army, for the army of the king was strongly intrenched at Pelusium, and effectually barred the way. She could not attempt to pass alone, or with few attendants, through the country, for every town and village was occupied with garrisons and officers under the orders of Pothinus, and she would be certainly intercepted. She had no fleet, and could not, therefore, make the passage by sea. Besides, even if she could by any means reach the gates of Alexandria, how was she to pass safely through the streets of the city to the palace where Cæsar resided, since the city, except in Cæsar's quarters, was wholly in the hands of Pothinus's government? The difficulties in the way of accomplishing her object seemed thus almost insurmountable.

She was, however, resolved to make the attempt. She sent a message to Cæsar, asking permission to appear before him and plead her own cause. Cæsar replied, urging her by all means to come. She took a single boat, and with the smallest number of attendants possible, made her way along the coast to Alexandria. The man on whom she principally relied in this hazardous expedition was a domestic named Apollodorus. She had, however, some other attendants besides. When the party reached Alexandria, they waited until night, and then advanced to the foot of the walls of the citadel. Here Apollodorus rolled the queen up in a piece of carpeting, and, covering the whole package with a cloth, he tied it with a thong, so as to give it the appearance of a bale of ordinary merchandise, and then throwing the load across his shoulder, he advanced into the city. Cleopatra was at this time about twenty-one years of age, but she was of a slender and graceful form, and the burden was, consequently, not very heavy. Apollodorus came to the gates of the palace where Cæsar was residing. The guards at the gates asked him what it was that he was carrying. He said that it was a present for Cæsar. So they allowed him to pass, and the pretended porter carried his package safely in.

When it was unrolled, and Cleopatra came out to view, Cæsar was perfectly charmed with the spectacle. In fact, the various conflicting emotions which she could not but feel under such circumstances as these, imparted a double interest to her beautiful and expressive face, and to her naturally bewitching manners. She was excited by the adventure through which she had passed, and yet pleased with her narrow escape from its dangers. The curiosity and interest which she felt on the one hand, in respect to the great personage into whose presence she had been thus strangely ushered, was very strong; but then, on the other, it was chastened and subdued by that feeling of timidity which, in new and unexpected situations like these, and under a consciousness of being the object of eager observation to the other sex, is inseparable from the nature of woman.

[Illustration: CLEOPATRA ENTERING THE PALACE OF CÆSAR.]

The conversation which Cæsar held with Cleopatra deepened the impression which her first appearance had made upon him. Her intelligence and animation, the originality of her ideas, and the point and pertinency of her mode of expressing them, made her, independently of her personal charms, an exceedingly entertaining and agreeable companion. She, in fact, completely won the great conqueror's heart; and, through the strong attachment to her which he immediately formed, he became wholly disqualified to act impartially between her and her brother in regard to their respective rights to the crown. We call Ptolemy Cleopatra's brother; for, though he was also, in fact, her husband, still, as he was only ten or twelve years of age at the time of Cleopatra's expulsion from Alexandria, the marriage had been probably regarded, thus far, only as a mere matter of form. Cæsar was now about fifty-two. He had a wife, named Calpurnia, to whom he had been married about ten years. She was living, at this time, in an unostentatious and quiet manner at Rome. She was a lady of an amiable and gentle character, devotedly attached to her husband, patient and

forbearing in respect to his faults, and often anxious and unhappy at the thought of the difficulties and dangers in which his ardent and unbounded ambition so often involved him.

Cæsar immediately began to take a very strong interest in Cleopatra's cause. He treated her personally with the fondest attention, and it was impossible for her not to reciprocate in some degree the kind feeling with which he regarded her. It was, in fact, something altogether new to her to have a warm and devoted friend, espousing her cause, tendering her protection, and seeking in every way to promote her happiness. Her father had all his life neglected her. Her brother, of years and understanding totally inferior to hers, whom she had been compelled to make her husband, had become her mortal enemy. It is true that, in depriving her of her inheritance and expelling her from her native land, he had been only the tool and instrument of more designing men. This, however, far from improving the point of view from which she regarded him, made him appear not only hateful, but contemptible too. All the officers of government, also, in the Alexandrian court had turned against her, because they had supposed that they could control her brother more easily if she were away. Thus she had always been surrounded by selfish, mercenary, and implacable foes. Now, for the first time, she seemed to have a friend. A protector had suddenly arisen to support and defend her--a man of very alluring person and manners, of a very noble and generous spirit, and of the very highest station. He loved her, and she could not refrain from loving him in return. She committed her cause entirely into his hands, confided to him all her interests, and gave herself up wholly into his power.

Nor was the unbounded confidence which she reposed in him undeserved, so far as related to his efforts to restore her to her throne. The legions which Cæsar had sent for into Syria had not yet arrived, and his situation in Alexandria was still very defenseless and very precarious. He did not, however, on this account, abate in the least degree the loftiness and self-confidence of the position which he had assumed, but he commenced immediately the work of securing Cleopatra's restoration. This quiet assumption of the right and power to arbitrate and decide such a question as that of the claim to the throne, in a country where he had accidentally landed and found rival claimants disputing for the succession, while he was still wholly destitute of the means of enforcing the superiority which he so coolly assumed, marks the immense ascendency which the Roman power had attained at this time in the estimation of mankind, and is, besides, specially characteristic of the genius and disposition of Cæsar.

Very soon after Cleopatra had come to him, Cæsar sent for the young Ptolemy, and urged upon him the duty and expediency of restoring Cleopatra. Ptolemy was beginning now to attain an age at which he might be supposed to have some opinion of his own on such a question. He declared himself utterly opposed to any such design. In the course of the conversation he learned that Cleopatra had arrived at Alexandria, and that she was then concealed in Cæsar's palace. This intelligence awakened in his mind the greatest excitement and indignation. He went away from Cæsar's presence in a rage. He tore the diadem which he was accustomed to wear from his head in the streets, threw it down, and trampled it under his feet. He declared to the people that he was betrayed, and displayed the most violent indications of vexation and chagrin. The chief subject of his complaint, in the attempts which he made to awaken the popular indignation against Cæsar and the Romans, was the disgraceful impropriety of the position which his sister had assumed in surrendering herself as she had done to Cæsar. It is most probable, however, unless his character was very different from that of every other Ptolemy in the line, that what really awakened his jealousy and anger was fear of the commanding influence and power to which Cleopatra was likely to attain through the agency of so distinguished a protector, rather than any other consequences of his friendship, or any real considerations of delicacy in respect to his sister's good name or his own marital honor.

However this may be, Ptolemy, together with Pothinus and Achillas, and all his other friends and adherents, who joined him in the terrible outcry that he made against the coalition which he had discovered between Cleopatra and Cæsar, succeeded in producing a very general and violent tumult throughout the city. The populace were aroused, and began to assemble in great crowds, and full of indignation and anger. Some knew the facts, and acted under something like an understanding of the cause of their anger. Others only knew that the aim of this sudden outbreak was to assault the Romans, and were ready, on any pretext, known or unknown, to join in any deeds of violence directed against these foreign intruders. There were others still, and these, probably, far the larger portion, who knew nothing and understood nothing but that there was to be tumult and a riot in and around the palaces, and were, accordingly, eager to be there.

Ptolemy and his officers had no large body of troops in Alexandria; for the events which had thus far occurred since Cæsar's arrival had succeeded each other so rapidly, that a very short time had yet elapsed, and the main army remained still at Pelusium. The main force, therefore, by which Cæsar was now attacked, consisted of the population of the city, headed, perhaps, by the few guards which the young king had at his command.

Cæsar, on his part, had but a small portion of his forces at the palace where he was attacked. The rest were scattered about the city. He, however, seems to have felt no alarm. He did not even confine himself to acting on the defensive. He sent out a detachment of his soldiers with orders to seize Ptolemy and bring him in a prisoner. Soldiers trained, disciplined, and armed as the Roman veterans were, and nerved by the ardor and enthusiasm which seemed always to animate troops which were under Cæsar's personal command, could accomplish almost any undertaking against a mere populace, however numerous or however furiously excited they might be. The soldiers sallied out, seized Ptolemy, and brought him in.

The populace were at first astounded at the daring presumption of this deed, and then exasperated at the indignity of it, considered as a violation of the person of their sovereign. The tumult would have greatly increased, had it not been that Cæsar--who had now attained all his ends in thus having brought Cleopatra and Ptolemy both within his power--thought it most expedient to allay it. He accordingly ascended to the window of a tower, or of some other elevated portion of his palace, so high that missiles from the mob below could not reach him, and began to make signals expressive of his wish to address them.

When silence was obtained, he made them a speech well calculated to quiet the excitement. He told them that he did not pretend to any right to judge between Cleopatra and Ptolemy as their superior, but only in the performance of the duty solemnly assigned by Ptolemy Auletes, the father, to the Roman people, whose representative he was. Other than this he claimed no jurisdiction in the case; and his only wish, in the discharge of the duty which devolved upon him to consider the cause, was to settle the question in a manner just and equitable to all the parties concerned, and thus arrest the progress of the civil war, which, if not arrested, threatened to involve the country in the most terrible calamities. He counseled them, therefore, to disperse, and no longer disturb the peace of the city. He would immediately take measures for trying the question between Cleopatra and Ptolemy, and he did not doubt but that they would all be satisfied with his decision.

This speech, made, as it was, in the eloquent and persuasive, and yet dignified and imposing manner for which Cæsar's harangues to turbulent assemblies like these were so famed, produced a great effect. Some were convinced, others were silenced; and those whose resentment and anger were not appeased, found themselves deprived of their power by the pacification of the rest. The mob was dispersed, and Ptolemy remained with Cleopatra in Cæsar's custody.

The next day, Cæsar, according to his promise, convened an assembly of the principal people of Alexandria and officers of state, and then brought out Ptolemy and Cleopatra, that he might decide their cause. The original will which Ptolemy Auletes had executed had been deposited in the public archives of Alexandria, and carefully preserved there. An authentic copy of it had been sent to Rome. Cæsar caused the original will to be brought out and read to the assembly. The provisions of it were perfectly explicit and clear. It required that Cleopatra and Ptolemy should be married, and then settled the sovereign power upon them jointly, as king and queen. It recognized the Roman commonwealth as the ally of Egypt, and constituted the Roman government the executor of the will, and the guardian of the king and queen. In fact, so clear and explicit was this document, that the simple reading of it seemed to be of itself a decision of the question. When, therefore, Cæsar announced that, in his judgment, Cleopatra was entitled to share the supreme power with Ptolemy, and that it was his duty, as the representative of the Roman power and the executor of the will, to protect both the king and the queen in their respective rights, there seemed to be nothing that could be said against his decision.

Besides Cleopatra and Ptolemy, there were two other children of Ptolemy Auletes in the royal family at this time. One was a girl, named Arsinoë. The other, a boy, was, singularly enough, named, like his brother, Ptolemy. These children were quite young, but Cæsar thought that it would perhaps gratify the Alexandrians, and lead them to acquiesce more readily in his decision, if he were to make some royal provision for them. He accordingly proposed to assign the island of Cyprus as a realm for them. This was literally a gift, for Cyprus was at this time a Roman possession.[5]

The whole assembly seemed satisfied with this decision except Pothinus. He had been so determined and inveterate an enemy to Cleopatra, that, as he was well aware, her restoration must end in his downfall and ruin. He went away from the assembly moodily determining that he would not submit to the decision, but would immediately adopt efficient measures to prevent its being carried into effect.

Cæsar made arrangements for a series of festivals and celebrations, to commemorate and confirm the re-establishment of a good understanding between the king and the queen, and the consequent termination of the war. Such celebrations, he judged, would have great influence in removing any remaining animosities from the minds of the people, and restore the dominion of a kind and friendly feeling throughout the city. The people fell in with these measures, and cordially co-operated to give them effect; but

Pothinus and Achillas, though they suppressed all outward expressions of discontent, made incessant efforts in secret to organize a party, and to form plans for overthrowing the influence of Cæsar, and making Ptolemy again the sole and exclusive sovereign.

Pothinus represented to all whom he could induce to listen to him that Cæsar's real design was to make Cleopatra queen alone, and to depose Ptolemy, and urged them to combine with him to resist a policy which would end in bringing Egypt under the dominion of a woman. He also formed a plan, in connection with Achillas, for ordering the army back from Pelusium. The army consisted of thirty thousand men. If that army could be brought to Alexandria and kept under Pothinus's orders, Cæsar and his three thousand Roman soldiers would be, they thought, wholly at their mercy.

There was, however, one danger to be guarded against in ordering the army to march toward the capital, and that was, that Ptolemy, while under Cæsar's influence, might open communications with the officers, and so obtain command of its movements, and thwart all the conspirators' designs. To prevent this, it was arranged between Pothinus and Achillas that the latter should make his escape from Alexandria, proceed immediately to the camp at Pelusium, resume the command of the troops there, and conduct them himself to the capital; and that in all these operations, and also subsequently on his arrival, he should obey no orders unless they came to him through Pothinus himself.

Although sentinels and guards were probably stationed at the gates and avenues leading from the city, Achillas contrived to effect his escape and to join the army. He placed himself at the head of the forces, and commenced his march toward the capital. Pothinus remained all the time within the city as a spy, pretending to acquiesce in Cæsar's decision, and to be on friendly terms with him, but really plotting for his overthrow, and obtaining all the information which his position enabled him to command, in order that he might co-operate with the army and Achillas when they should arrive.

All these things were done with the utmost secrecy, and so cunning and adroit were the conspirators in forming and executing their plots, that Cæsar seems to have had no knowledge of the measures which his enemies were taking, until he suddenly heard that the main body of Ptolemy's army was approaching the city, at least twenty thousand strong. In the mean time, however, the forces which he had sent for from Syria had not arrived, and no alternative was left but to defend the capital and himself as well as he could with the very small force which he had at his disposal.

He determined, however, first, to try the effect of orders sent out in Ptolemy's name to forbid the approach of the army to the city. Two officers were accordingly intrusted with these orders, and sent out to communicate them to Achillas. The names of these officers were Dioscorides and Serapion.

It shows in a very striking point of view to what an incredible exaltation the authority and consequence of a sovereign king rose in those ancient days, in the minds of men, that Achillas, at the moment when these men made their appearance in the camp, bearing evidently some command from Ptolemy in the city, considered it more prudent to kill them at once, without hearing their message, rather than to allow the orders to be delivered and then take the responsibility of disobeying them. If he could succeed in marching to Alexandria and in taking possession of the city, and then in expelling Cæsar and Cleopatra and restoring Ptolemy to the exclusive possession of the throne, he knew very well that the king would rejoice in the result, and would overlook all irregularities on his part in the means by which he had accomplished it, short of absolute disobedience of a known command. Whatever might be the commands that these messengers were bringing him, he supposed that they doubtless originated, not in Ptolemy's own free will, but that they were dictated by the authority of Cæsar. Still, they would be commands coming in Ptolemy's name; and the universal experience of officers serving under the military despots of those ancient days showed that, rather than to take the responsibility of directly disobeying a royal order once received, it was safer to avoid receiving it by murdering the messengers.

Achillas therefore directed the officers to be seized and slain. They were accordingly taken off and speared by the soldiers, and then the bodies were borne away. The soldiers, however, it was found, had not done their work effectually. There was no interest for them in such a cold-blooded assassination, and perhaps something like a sentiment of compassion restrained their hands. At any rate, though both the men were desperately wounded, one only died. The other lived and recovered.

Achillas continued to advance toward the city. Cæsar, finding that the crisis which was approaching was becoming very serious in its character, took, himself, the whole command within the capital, and began to make the best arrangements possible under the circumstances of the case to defend himself there. His numbers were altogether too small to defend the whole city against the overwhelming force which was advancing to assail it. He accordingly intrenched his troops in the palaces and in the citadel, and in such other parts of the city as it seemed practicable to defend. He barricaded all the streets and avenues leading to these points, and fortified the gates. Nor did he, while thus doing all in his power to employ the insufficient means of defense already in his hands

to the best advantage, neglect the proper exertions for obtaining succor from abroad. He sent off galleys to Syria, to Cyprus, to Rhodes, and to every other point accessible from Alexandria where Roman troops might be expected to be found, urging the authorities there to forward re-enforcements to him with the utmost possible dispatch.

During all this time Cleopatra and Ptolemy remained in the palace with Cæsar, both ostensibly co-operating with him in his councils and measures for defending the city from Achillas. Cleopatra, of course, was sincere and in earnest in this co-operation; but Ptolemy's adhesion to the common cause was very little to be relied upon. Although, situated as he was, he was compelled to seem to be on Cæsar's side, he must have secretly desired that Achillas should succeed and Cæsar's plans be overthrown. Pothinus was more active, though not less cautious in his hostility to them. He opened a secret communication with Achillas, sending him information, from time to time, of what took place within the walls, and of the arrangements made there for the defense of the city against him, and gave him also directions how to proceed. He was very wary and sagacious in all these movements, feigning all the time to be on Cæsar's side. He pretended to be very zealously employed in aiding Cæsar to secure more effectually the various points where attacks were to be expected, and in maturing and completing the arrangements for defense.

But, notwithstanding all his cunning, he was detected in his double dealing, and his career was suddenly brought to a close, before the great final conflict came on. There was a barber in Cæsar's household, who, for some cause or other, began to suspect Pothinus; and, having little else to do, he employed himself in watching the eunuch's movements and reporting them to Cæsar. Cæsar directed the barber to continue his observations. He did so; his suspicions were soon confirmed, and at length a letter, which Pothinus had written to Achillas, was intercepted and brought to Cæsar. This furnished the necessary proof of what they called his guilt, and Cæsar ordered him to be beheaded.

This circumstance produced, of course, a great excitement within the palace, for Pothinus had been for many years the great ruling minister of state--the king, in fact, in all but in name. His execution alarmed a great many others, who, though in Cæsar's power, were secretly wishing that Achillas might prevail. Among those most disturbed by these fears was a man named Ganymede. He was the officer who had charge of Arsinoë, Cleopatra's sister. The arrangement which Cæsar had proposed for establishing her in conjunction with her brother Ptolemy over the island of Cyprus had not gone into effect; for, immediately after the decision of Cæsar, the attention of all concerned had been wholly engrossed by the tidings of the advance of the army, and by the busy preparations which were required on all hands for the impending contest. Arsinoë, therefore, with her governor Ganymede, remained in the palace. Ganymede had joined Pothinus in his plots; and when Pothinus was beheaded, he concluded that it would be safest for him to fly.

He accordingly resolved to make his escape from the city, taking Arsinoë with him. It was a very hazardous attempt, but he succeeded in accomplishing it. Arsinoë was very willing to go, for she was now beginning to be old enough to feel the impulse of that insatiable and reckless ambition which seemed to form such an essential element in the character of every son and daughter in the whole Ptolemaic line. She was insignificant and powerless where she was, but at the head of the army she might become immediately a queen.

It resulted, in the first instance, as she had anticipated. Achillas and his army received her with acclamations. Under Ganymede's influence they decided that, as all the other members of the royal family were in durance, being held captive by a foreign general, who had by chance obtained possession of the capital, and were thus incapacitated for exercising the royal power, the crown devolved upon Arsinoë; and they accordingly proclaimed her queen.

Every thing was now prepared for a desperate and determined contest for the crown between Cleopatra, with Cæsar for her minister and general, on the one side, and Arsinoë, with Ganymede and Achillas for her chief officers, on the other. The young Ptolemy, in the mean time, remained Cæsar's prisoner, confused with the intricacies in which the quarrel had become involved, and scarcely knowing now what to wish in respect to the issue of the contest. It was very difficult to foresee whether it would be best for him that Cleopatra or that Arsinoë should succeed.

CHAPTER VII.

THE ALEXANDRINE WAR.

The war which ensued as the result of the intrigues and maneuvers described in the last chapter is known in the history of Rome and Julius Cæsar as the Alexandrine war. The events which occurred during the progress of it, and its termination at last in the triumph of Cæsar and Cleopatra, will form the subject of this chapter.

Achillas had greatly the advantage over Cæsar at the outset of the contest, in respect to the strength of the forces under his command. Cæsar, in fact, had with him only a detachment of three or four thousand men, a small body of troops which he had hastily put on board a little squadron of Rhodian galleys for pursuing Pompey across the Mediterranean. When he set sail from the European shores with this inconsiderable fleet, it is probable that he had no expectation even of landing in Egypt at all, and much less of being involved in great military undertakings there. Achillas, on the other hand, was at the head of a force of twenty thousand effective men. His troops were, it is true, of a somewhat miscellaneous character, but they were all veteran soldiers, inured to the climate of Egypt, and skilled in all the modes of warfare which were suited to the character of the country. Some of them were Roman soldiers, men who had come with the army of Mark Antony from Syria when Ptolemy Auletes, Cleopatra's father, was reinstated on the throne, and had been left in Egypt, in Ptolemy's service, when Antony returned to Rome. Some were native Egyptians. There was also in the army of Achillas a large number of fugitive slaves--refugees who had made their escape from various points along the shores of the Mediterranean, at different periods, and had been from time to time incorporated into the Egyptian army. These fugitives were all men of the most determined and desperate character.

Achillas had also in his command a force of two thousand horse. Such a body of cavalry made him, of course, perfect master of all the open country outside the city walls. At the head of these troops Achillas gradually advanced to the very gates of Alexandria, invested the city on every side, and shut Cæsar closely in.

The danger of the situation in which Cæsar was placed was extreme; but he had been so accustomed to succeed in extricating himself from the most imminent perils, that neither he himself nor his army seem to have experienced any concern in respect to the result. Cæsar personally felt a special pride and pleasure in encountering the difficulties and dangers which now beset him, because Cleopatra was with him to witness his demeanor, to admire his energy and courage, and to reward by her love the efforts and sacrifices which he was making in espousing her cause. She confided every thing to him, but she watched all the proceedings with the most eager interest, elated with hope in respect to the result, and proud of the champion who had thus volunteered to defend her. In a word, her heart was full of gratitude, admiration, and love.

The immediate effect, too, of the emotions which she felt so strongly was greatly to heighten her natural charms. The native force and energy of her character were softened and subdued. Her voice, which always possessed a certain inexpressible charm, was endued with new sweetness through the influence of affection. Her countenance beamed with fresh animation and beauty, and the sprightliness and vivacity of her character, which became at later periods of her life boldness and eccentricity, now being softened and restrained within proper limits by the respectful regard with which she looked upon Cæsar, made her an enchanting companion. Cæsar was, in fact, entirely intoxicated with the fascinations which she unconsciously displayed.

Under other circumstances than these, a personal attachment so strong, formed by a military commander while engaged in active service, might have been expected to interfere in some degree with the discharge of his duties; but in this case, since it was for Cleopatra's sake and in her behalf that the operations which Cæsar had undertaken were to be prosecuted, his love for her only stimulated the spirit and energy with which he engaged in them.

The first measure to be adopted was, as Cæsar plainly perceived, to concentrate and strengthen his position in the city, so that he might be able to defend himself there against Achillas until he should receive re-enforcements from abroad. For this purpose he selected a certain group of palaces and citadels which lay together near the head of the long pier or causeway which led to the Pharos, and, withdrawing his troops from all other parts of the city, established them there. The quarter which he thus occupied contained the great city arsenals and public granaries. Cæsar brought together all the arms and munitions of war which he could find in other parts of the city, and also all the corn and other provisions which were contained either in the public depôts or in private warehouses, and stored the whole within his lines. He then inclosed the whole quarter with strong defenses. The avenues leading to it were barricaded with walls of stone. Houses in the vicinity which might have afforded shelter to an enemy were demolished, and the materials used in constructing walls wherever they were needed, or in strengthening the barricades. Prodigious military engines, made to throw heavy stones, and beams of wood, and other ponderous missiles, were set up within his lines, and openings were made in the walls and other defenses of the citadel, wherever necessary, to facilitate the action of these machines.

[Illustration: VIEW OF ALEXANDRIA.]

There was a strong fortress situated at the head of the pier or mole leading to the island of Pharos, which was without Cæsar's lines, and still in the hands of the Egyptian authorities. The Egyptians thus commanded the entrance to the mole. The island itself, also, with the fortress at the other end of the pier, was still in the possession of the Egyptian authorities, who seemed disposed to

hold it for Achillas. The mole was very long, as the island was nearly a mile from the shore. There was quite a little town upon the island itself, besides the fortress or castle built there to defend the place. The garrison of this castle was strong, and the inhabitants of the town, too, constituted a somewhat formidable population, as they consisted of fishermen, sailors, wreckers, and such other desperate characters as usually congregate about such a spot. Cleopatra and Cæsar, from the windows of their palace within the city, looked out upon this island, with the tall light-house rising in the center of it and the castle at its base, and upon the long and narrow isthmus connecting it with the main land, and concluded that it was very essential that they should get possession of the post, commanding, as it did, the entrance to the harbor.

In the harbor, too, which, as will be seen from the engraving, was on the south side of the mole, and, consequently, on the side opposite to that from which Achillas was advancing toward the city, there were lying a large number of Egyptian vessels, some dismantled, and others manned and armed more or less effectively. These vessels had not yet come into Achillas's hands, but it would be certain that he would take possession of them as soon as he should gain admittance to those parts of the city which Cæsar had abandoned. This it was extremely important to prevent; for, if Achillas held this fleet, especially if he continued to command the island of Pharos, he would be perfect master of all the approaches to the city on the side of the sea. He could then not only receive re-enforcements and supplies himself from that quarter, but he could also effectually cut off the Roman army from all possibility of receiving any. It became, therefore, as Cæsar thought, imperiously necessary that he should protect himself from this danger. This he did by sending out an expedition to burn all the shipping in the harbor, and, at the same time, to take possession of a certain fort upon the island of Pharos which commanded the entrance to the port. This undertaking was abundantly successful. The troops burned the shipping, took the fort, expelled the Egyptian soldiers from it, and put a Roman garrison into it instead, and then returned in safety within Cæsar's lines. Cleopatra witnessed these exploits from her palace windows with feelings of the highest admiration for the energy and valor which her Roman protectors displayed.

The burning of the Egyptian ships in this action, however fortunate for Cleopatra and Cæsar, was attended with a catastrophe which has ever since been lamented by the whole civilized world. Some of the burning ships were driven by the wind to the shore, where they set fire to the buildings which were contiguous to the water. The flames spread and produced an extensive conflagration, in the course of which the largest part of the great library was destroyed. This library was the only general collection of the ancient writings that ever had been made, and the loss of it was never repaired.

The destruction of the Egyptian fleet resulted also in the downfall and ruin of Achillas. From the time of Arsinoë's arrival in the camp there had been a constant rivalry and jealousy between himself and Ganymede, the eunuch who had accompanied Arsinoë in her flight. Two parties had been formed in the army, some declaring for Achillas and some for Ganymede. Arsinoë advocated Ganymede's interests, and when, at length, the fleet was burned, she charged Achillas with having been, by his neglect or incapacity, the cause of the loss. Achillas was tried, condemned, and beheaded. From that time Ganymede assumed the administration of Arsinoë's government as her minister of state and the commander-in-chief of her armies.

About the time that these occurrences took place, the Egyptian army advanced into those parts of the city from which Cæsar had withdrawn, producing those terrible scenes of panic and confusion which always attend a sudden and violent change of military possession within the precincts of a city. Ganymede brought up his troops on every side to the walls of Cæsar's citadels and intrenchments, and hemmed him closely in. He cut off all avenues of approach to Cæsar's lines by land, and commenced vigorous preparations for an assault. He constructed engines for battering down the walls. He opened shops and established forges in every part of the city for the manufacture of darts, spears, pikes, and all kinds of military machinery. He built towers supported upon huge wheels, with the design of filling them with armed men when finally ready to make his assault upon Cæsar's lines, and moving them up to the walls of the citadels and palaces, so as to give to his soldiers the advantage of a lofty elevation in making their attacks. He levied contributions on the rich citizens for the necessary funds, and provided himself with men by pressing all the artisans, laborers, and men capable of bearing arms into his service. He sent messengers back into the interior of the country, in every direction, summoning the people to arms, and calling for contributions of money and military stores.

These messengers were instructed to urge upon the people that, unless Cæsar and his army were at once expelled from Alexandria, there was imminent danger that the national independence of Egypt would be forever destroyed. The Romans, they were to say, had extended their conquests over almost all the rest of the world. They had sent one army into Egypt before, under the command of Mark Antony, under the pretense of restoring Ptolemy Auletes to the throne. Now another commander, with another force, had come, offering some other pretexts for interfering in their affairs. These Roman encroachments, the messengers were to say, would end in the complete subjugation of Egypt to a foreign power, unless the people of the country aroused themselves to meet the danger manfully, and to expel the intruders.

As Cæsar had possession of the island of Pharos and of the harbor, Ganymede could not cut him off from receiving such re-enforcements of men and arms as he might make arrangements for obtaining beyond the sea; nor could he curtail his supply of food, as the granaries and magazines within Cæsar's quarter of the city contained almost inexhaustible stores of corn. There was one remaining point essential to the subsistence of an army besieged, and that was an abundant supply of water. The palaces and citadels which Cæsar occupied were supplied with water by means of numerous subterranean aqueducts, which conveyed the water from the Nile to vast cisterns built under ground, whence it was raised by buckets and hydraulic engines for use. In reflecting upon this circumstance, Ganymede conceived the design of secretly digging a canal, so as to turn the waters of the sea by means of it into these aqueducts. This plan he carried into effect. The consequence was, that the water in the cisterns was gradually changed. It became first brackish, then more and more salt and bitter, until, at length, it was wholly impossible to use it. For some time the army within could not understand these changes; and when, at length, they discovered the cause, the soldiers were panic-stricken at the thought that they were now apparently wholly at the mercy of their enemies, since, without supplies of water, they must all immediately perish. They considered it hopeless to attempt any longer to hold out, and urged Cæsar to evacuate the city, embark on board his galleys, and proceed to sea.

Instead of doing this, however, Cæsar, ordering all other operations to be suspended, employed the whole laboring force of his command, under the direction of the captains of the several companies, in digging wells in every part of his quarter of the city. Fresh water, he said, was almost invariably found, at a moderate depth, upon sea-coasts, even upon ground lying in very close proximity with the sea. The diggings were successful. Fresh water, in great abundance, was found. Thus this danger was passed, and the men's fears effectually relieved.

A short time after these transactions occurred, there came into the harbor one day, from along the shore west of the city, a small sloop, bringing the intelligence that a squadron of transports had arrived upon the coast to the westward of Alexandria, and had anchored there, being unable to come up to the city on account of an easterly wind which prevailed at that season of the year. This squadron was one which had been sent across the Mediterranean with arms, ammunition, and military stores for Cæsar, in answer to requisitions which he had made immediately after he had landed. The transports being thus wind-bound on the coast, and having nearly exhausted their supplies of water, were in distress; and they accordingly sent forward the sloop, which was probably propelled by oars, to make known their situation to Cæsar, and to ask for succor. Cæsar immediately went, himself, on board of one of his galleys, and ordering the remainder of his little fleet to follow him, he set sail out of the harbor, and then turned to the westward, with a view of proceeding along the coast to the place where the transports were lying.

All this was done secretly. The land is so low in the vicinity of Alexandria that boats or galleys are out of sight from it at a very short distance from the shore. In fact, travelers say that, in coming upon the coast, the illusion produced by the spherical form of the surface of the water and the low and level character of the coast is such that one seems actually to descend from the sea to the land. Cæsar might therefore have easily kept his expedition a secret, had it not been that, in order to be provided with a supply of water for the transports immediately on reaching them, he stopped at a solitary part of the coast, at some distance from Alexandria, and sent a party a little way into the interior in search for water. This party were discovered by the country people, and were intercepted by a troop of horse and made prisoners. From these prisoners the Egyptians learned that Cæsar himself was on the coast with a small squadron of galleys. The tidings spread in all directions. The people flocked together from every quarter. They hastily collected all the boats and vessels which could be obtained at the villages in that region and from the various branches of the Nile. In the mean time, Cæsar had gone on to the anchorage ground of the squadron, and had taken the transports in tow to bring them to the city; for the galleys, being propelled by oars, were in a measure independent of the wind. On his return, he found quite a formidable naval armament assembled to dispute the passage.

A severe conflict ensued, but Cæsar was victorious. The navy which the Egyptians had so suddenly got together was as suddenly destroyed. Some of the vessels were burned, others sunk, and others captured; and Cæsar returned in triumph to the port with his transports and stores. He was welcomed with the acclamations of his soldiers, and, still more warmly, by the joy and gratitude of Cleopatra, who had been waiting during his absence in great anxiety and suspense to know the result of the expedition, aware as she was that her hero was exposing himself in it to the most imminent personal danger.

The arrival of these re-enforcements greatly improved Cæsar's condition, and the circumstance of their coming forced upon the mind of Ganymede a sense of the absolute necessity that he should gain possession of the harbor if he intended to keep Cæsar in check. He accordingly determined to take immediate measures for forming a naval force. He sent along the coast, and ordered every ship and galley that could be found in all the ports to be sent immediately to Alexandria. He employed as many men as

possible in and around the city in building more. He unroofed some of the most magnificent edifices to procure timber as a material for making benches and oars. When all was ready, he made a grand attack upon Cæsar in the port, and a terrible contest ensued for the possession of the harbor, the mole, the island, and the citadels and fortresses commanding the entrances from the sea. Cæsar well knew that this contest would be a decisive one in respect to the final result of the war, and he accordingly went forth himself to take an active and personal part in the conflict. He felt doubtless, too, a strong emotion of pride and pleasure in exhibiting his prowess in the sight of Cleopatra, who could watch the progress of the battle from the palace windows, full of excitement at the dangers which he incurred, and of admiration at the feats of strength and valor which he performed. During this battle the life of the great conqueror was several times in the most imminent danger. He wore a habit or mantle of the imperial purple, which made him a conspicuous mark for his enemies; and, of course, wherever he went, in that place was the hottest of the fight. Once, in the midst of a scene of most dreadful confusion and din, he leaped from an overloaded boat into the water and swam for his life, holding his cloak between his teeth and drawing it through the water after him, that it might not fall into the hands of his enemies. He carried, at the same time, as he swam, certain valuable papers which he wished to save, holding them above his head with one hand, while he propelled himself through the water with the other.

The result of this contest was another decisive victory for Cæsar. Not only were the ships which the Egyptians had collected defeated and destroyed, but the mole, with the fortresses at each extremity of it, and the island, with the light-house and the town of Pharos, all fell into Cæsar's hands.

The Egyptians now began to be discouraged. The army and the people, judging, as mankind always do, of the virtue of their military commanders solely by the criterion of success, began to be tired of the rule of Ganymede and Arsinoë. They sent secret messengers to Cæsar avowing their discontent, and saying that, if he would liberate Ptolemy--who, it will be recollected, had been all this time held as a sort of prisoner of state in Cæsar's palaces--they thought that the people generally would receive him as their sovereign, and that then an arrangement might easily be made for an amicable adjustment of the whole controversy. Cæsar was strongly inclined to accede to this proposal.

He accordingly called Ptolemy into his presence, and, taking him kindly by the hand, informed him of the wishes of the people of Egypt, and gave him permission to go. Ptolemy, however, begged not to be sent away. He professed the strongest attachment to Cæsar, and the utmost confidence in him, and he very much preferred, he said, to remain under his protection. Cæsar replied that, if those were his sentiments, the separation would not be a lasting one. "If we part as friends," he said, "we shall soon meet again." By these and similar assurances he endeavored to encourage the young prince, and then sent him away. Ptolemy was received by the Egyptians with great joy, and was immediately placed at the head of the government. Instead, however, of endeavoring to promote a settlement of the quarrel with Cæsar, he seemed to enter into it now himself, personally, with the utmost ardor, and began at once to make the most extensive preparations both by sea and land for a vigorous prosecution of the war. What the result of these operations would have been can now not be known, for the general aspect of affairs was, soon after these transactions, totally changed by the occurrence of a new and very important event which suddenly intervened, and which turned the attention of all parties, both Egyptians and Romans, to the eastern quarter of the kingdom. The tidings arrived that a large army, under the command of a general named Mithradates, whom Cæsar had dispatched into Asia for this purpose, had suddenly appeared at Pelusium, had captured that city, and were now ready to march to Alexandria.

The Egyptian army immediately broke up its encampments in the neighborhood of Alexandria, and marched to the eastward to meet these new invaders. Cæsar followed them with all the forces that he could safely take away from the city. He left the city in the night and unobserved, and moved across the country with such celerity that he joined Mithradates before the forces of Ptolemy had arrived. After various marches and maneuvers, the armies met, and a great battle was fought. The Egyptians were defeated. Ptolemy's camp was taken. As the Roman army burst in upon one side of it, the guards and attendants of Ptolemy fled upon the other, clambering over the ramparts in the utmost terror and confusion. The foremost fell headlong into the ditch below, which was thus soon filled to the brim with the dead and the dying; while those who came behind pressed on over the bridge thus formed, trampling remorselessly, as they fled, on the bodies of their comrades, who lay writhing, struggling, and shrieking beneath their feet. Those who escaped reached the river. They crowded together into a boat which lay at the bank and pushed off from the shore. The boat was overloaded, and it sank as soon as it left the land. The Romans drew the bodies which floated to the shore up upon the bank again, and they found among them one, which, by the royal cuirass which was upon it, the customary badge and armor of the Egyptian kings, they knew to be the body of Ptolemy.

The victory which Cæsar obtained in this battle and the death of Ptolemy ended the war. Nothing now remained but for him to place himself at the head of the combined forces and march back to Alexandria. The Egyptian forces which had been left there made no

resistance, and he entered the city in triumph. He took Arsinoë prisoner. He decreed that Cleopatra should reign as queen, and that she should marry her youngest brother, the other Ptolemy--a boy at this time about eleven years of age. A marriage with one so young was, of course, a mere form. Cleopatra remained, as before, the companion of Cæsar.

Cæsar had, in the mean time, incurred great censure at Rome, and throughout the whole Roman world, for having thus turned aside from his own proper duties as the Roman consul, and the commander-in-chief of the armies of the empire, to embroil himself in the quarrels of a remote and secluded kingdom, with which the interests of the Roman commonwealth were so little connected. His friends and the authorities at Rome were continually urging him to return. They were especially indignant at his protracted neglect of his own proper duties, from knowing that he was held in Egypt by a guilty attachment to the queen--thus not only violating his obligations to the state, but likewise inflicting upon his wife Calpurnia, and his family at Rome, an intolerable wrong. But Cæsar was so fascinated by Cleopatra's charms, and by the mysterious and unaccountable influence which she exercised over him, that he paid no heed to any of these remonstrances. Even after the war was ended he remained some months in Egypt to enjoy his favorite's society. He would spend whole nights in her company, in feasting and revelry. He made a splendid royal progress with her through Egypt after the war was over, attended by a numerous train of Roman guards. He formed a plan for taking her to Rome, and marrying her there; and he took measures for having the laws of the city altered so as to enable him to do so, though he was already married.

All these things produced great discontent and disaffection among Cæsar's friends and throughout the Roman army. The Egyptians, too, strongly censured the conduct of Cleopatra. A son was born to her about this time, whom the Alexandrians named, from his father, Cæsarion. Cleopatra was regarded in the new relation of mother, which she now sustained, not with interest and sympathy, but with feelings of reproach and condemnation.

Cleopatra was all this time growing more and more accomplished and more and more beautiful; but her vivacity and spirit, which had been so charming while it was simple and childlike, now began to appear more forward and bold. It is the characteristic of pure and lawful love to soften and subdue the heart, and infuse a gentle and quiet spirit into all its action; while that which breaks over the barriers that God and nature have marked out for it, tends to make woman masculine and bold, to indurate all her sensibilities, and to destroy that gentleness and timidity of demeanor which have so great an influence in heightening her charms. Cleopatra was beginning to experience these effects. She was indifferent to the opinions of her subjects, and was only anxious to maintain as long as possible her guilty ascendency over Cæsar.

Cæsar, however, finally determined to set out on his return to the capital. Leaving Cleopatra, accordingly, a sufficient force to secure the continuance of her power, he embarked the remainder of his forces in his transports and galleys, and sailed away. He took the unhappy Arsinoë with him, intending to exhibit her as a trophy of his Egyptian victories on his arrival at Rome.

CHAPTER VIII.

CLEOPATRA A QUEEN.

The war by which Cæsar reinstated Cleopatra upon the throne was not one of very long duration. Cæsar arrived in Egypt in pursuit of Pompey about the 1st of August; the war was ended and Cleopatra established in secure possession by the end of January; so that the conflict, violent as it was while it continued, was very brief, the peaceful and commercial pursuits of the Alexandrians having been interrupted by it only for a few months.

Nor did either the war itself, or the derangements consequent upon it, extend very far into the interior of the country. The city of Alexandria itself and the neighboring coasts were the chief scenes of the contest until Mithradates arrived at Pelusium. He, it is true, marched across the Delta, and the final battle was fought in the interior of the country. It was, however, after all, but a very small portion of the Egyptian territory that was directly affected by the war. The great mass of the people, occupying the rich and fertile tracts which bordered the various branches of the Nile, and the long and verdant valley which extended so far into the heart of the continent, knew nothing of the conflict but by vague and distant rumors. The pursuits of the agricultural population went on, all the time, as steadily and prosperously as ever; so that when the conflict was ended, and Cleopatra entered upon the quiet and peaceful possession of her power, she found that the resources of her empire were very little impaired.

She availed herself, accordingly, of the revenues which poured in very abundantly upon her, to enter upon a career of the greatest luxury, magnificence, and splendor. The injuries which had been done to the palaces and other public edifices of Alexandria by the fire, and by the military operations of the siege, were repaired. The bridges which had been broken down were rebuilt. The canals

which had been obstructed were opened again. The sea-water was shut off from the palace cisterns; the rubbish of demolished houses was removed; the barricades were cleared from the streets; and the injuries which the palaces had suffered, either from the violence of military engines or the rough occupation of the Roman soldiery, were repaired. In a word, the city was speedily restored once more, so far as was possible, to its former order and beauty. The five hundred thousand manuscripts of the Alexandrian library, which had been burned, could not, indeed, be restored; but, in all other respects, the city soon resumed in appearance all its former splendor. Even in respect to the library, Cleopatra made an effort to retrieve the loss. She repaired the ruined buildings, and afterward, in the course of her life, she brought together, it was said, in a manner hereafter to be described, one or two hundred thousand rolls of manuscripts, as the commencement of a new collection. The new library, however, never acquired the fame and distinction that had pertained to the old.

The former sovereigns of Egypt, Cleopatra's ancestors, had generally, as has already been shown, devoted the immense revenues which they extorted from the agriculturalists of the valley of the Nile to purposes of ambition. Cleopatra seemed now disposed to expend them in luxury and pleasure. They, the Ptolemies, had employed their resources in erecting vast structures, or founding magnificent institutions at Alexandria, to add to the glory of the city, and to widen and extend their own fame. Cleopatra, on the other hand, as was, perhaps, naturally to be expected of a young, beautiful, and impulsive woman, suddenly raised to so conspicuous a position, and to the possession of such unbounded wealth and power, expended her royal revenues in plans of personal display, and in scenes of festivity, gayety, and enjoyment. She adorned her palaces, built magnificent barges for pleasure excursions on the Nile, and expended enormous sums for dress, for equipages, and for sumptuous entertainments. In fact, so lavish were her expenditures for these and similar purposes during the early years of her reign, that she is considered as having carried the extravagance of sensual luxury and personal display and splendor beyond the limits that had ever before or have ever since been attained.

Whatever of simplicity of character, and of gentleness and kindness of spirit she might have possessed in her earlier years, of course gradually disappeared under the influences of such a course of life as she now was leading. She was beautiful and fascinating still, but she began to grow selfish, heartless, and designing. Her little brother--he was but eleven years of age, it will be recollected, when Cæsar arranged the marriage between them--was an object of jealousy to her. He was now, of course, too young to take any actual share in the exercise of the royal power, or to interfere at all in his sister's plans or pleasures. But then he was growing older. In a few years he would be fifteen--which was the period of life fixed upon by Cæsar's arrangements, and, in fact, by the laws and usages of the Egyptian kingdom--when he was to come into possession of power as king, and as the husband of Cleopatra. Cleopatra was extremely unwilling that the change in her relations to him and to the government, which this period was to bring, should take place. Accordingly, just before the time arrived, she caused him to be poisoned. His death released her, as she had intended, from all restraints, and thereafter she continued to reign alone. During the remainder of her life, so far as the enjoyment of wealth and power, and of all other elements of external prosperity could go, Cleopatra's career was one of uninterrupted success. She had no conscientious scruples to interfere with the most full and unrestrained indulgence of every propensity of her heart, and the means of indulgence were before her in the most unlimited profusion. The only bar to her happiness was the impossibility of satisfying the impulses and passions of the human soul, when they once break over the bounds which the laws both of God and of nature ordain for restraining them.

In the mean time, while Cleopatra was spending the early years of her reign in all this luxury and splendor, Cæsar was pursuing his career, as the conqueror of the world, in the most successful manner. On the death of Pompey, he would naturally have succeeded at once to the enjoyment of the supreme power; but his delay in Egypt, and the extent to which it was known that he was entangled with Cleopatra, encouraged and strengthened his enemies in various parts of the world. In fact, a revolt which broke out in Asia Minor, and which it was absolutely necessary that he should proceed at once to quell, was the immediate cause of his leaving Egypt at last. Other plans for making head against Cæsar's power were formed in Spain, in Africa, and in Italy. His military skill and energy, however, were so great, and the ascendency which he exercised over the minds of men by his personal presence was so unbounded, and so astonishing, moreover, was the celerity with which he moved from continent to continent, and from kingdom to kingdom, that in a very short period from the time of his leaving Egypt, he had conducted most brilliant and successful campaigns in all the three quarters of the world then known, had put down effectually all opposition to his power, and then had returned to Rome the acknowledged master of the world. Cleopatra, who had, of course, watched his career during all this time with great pride and pleasure, concluded, at last, to go to Rome and make a visit to him there.

The people of Rome were, however, not prepared to receive her very cordially. It was an age in which vice of every kind was regarded with great indulgence, but the moral instincts of mankind were too strong to be wholly blinded to the true character of so

conspicuous an example of wickedness as this. Arsinoë was at Rome, too, during this period of Cæsar's life. He had brought her there, it will be recollected, on his return from Egypt, as a prisoner, and as a trophy of his victory. His design was, in fact, to reserve her as a captive to grace his _triumph_.

A triumph, according to the usages of the ancient Romans, was a grand celebration decreed by the senate to great military commanders of the highest rank, when they returned from distant campaigns in which they had made great conquests or gained extraordinary victories. Cæsar concentrated all his triumphs into one. They were celebrated on his return to Rome for the last time, after having completed the conquest of the world. The processions of this triumph occupied four days. In fact, there were four triumphs, one on each day for the four days. The wars and conquests which these ovations were intended to celebrate were those of Gaul, of Egypt, of Asia, and of Africa; and the processions on the several days consisted of endless trains of prisoners, trophies, arms, banners, pictures, images, convoys of wagons loaded with plunder, captive princes and princesses, animals, wild and tame, and every thing else which the conqueror had been able to bring home with him from his campaigns, to excite the curiosity or the admiration of the people of the city, and illustrate the magnitude of his exploits. Of course, the Roman generals, when engaged in distant foreign wars, were ambitious of bringing back as many distinguished captives and as much public plunder as they were able to obtain, in order to add to the variety and splendor of the triumphal procession by which their victories were to be honored on their return. It was with this view that Cæsar brought Arsinoë from Egypt; and he had retained her as his captive at Rome until his conquests were completed and the time for his triumph arrived. She, of course, formed a part of the triumphal train on the _Egyptian_ day. She walked immediately before the chariot in which Cæsar rode. She was in chains, like any other captive, though her chains, in honor of her lofty rank, were made of gold.

[Illustration: CLEOPATRA'S SISTER IN THE TRIUMPHAL PROCESSION.]

The effect, however, upon the Roman population of seeing the unhappy princess, overwhelmed as she was with sorrow and chagrin, as she moved slowly along in the train, among the other emblems and trophies of violence and plunder, proved to be by no means favorable to Cæsar. The populace were inclined to pity her, and to sympathize with her in her sufferings. The sight of her distress recalled, too, to their minds the dereliction from duty of which Cæsar had been guilty of in his yielding to the enticements of Cleopatra, and remaining so long in Egypt to the neglect of his proper duties as a Roman minister of state. In a word, the tide of admiration for Cæsar's military exploits which had been setting so strongly in his favor, seemed inclined to turn, and the city was filled with murmurs against him even in the midst of his triumphs.

In fact, the pride and vainglory which led Cæsar to make his triumphs more splendid and imposing than any former conqueror had ever enjoyed, caused him to overact his part so as to produce effects the reverse of his intentions. The case of Arsinoë was one example of this. Instead of impressing the people with a sense of the greatness of his exploits in Egypt, in deposing one queen and bringing her captive to Rome, in order that he might place another upon the throne in her stead, it only reproduced anew the censures and criminations which he had deserved by his actions there, but which, had it not been for the pitiable spectacle of Arsinoë in the train, might have been forgotten.

There were other examples of a similar character. There were the feasts, for instance. From the plunder which Cæsar had obtained in his various campaigns, he expended the most enormous sums in making feasts and spectacles for the populace at the time of his triumph. A large portion of the populace was pleased, it is true, with the boundless indulgences thus offered to them; but the better part of the Roman people were indignant at the waste and extravagance which were every where displayed. For many days the whole city of Rome presented to the view nothing but one wide-spread scene of riot and debauchery. The people, instead of being pleased with this abundance, said that Cæsar must have practiced the most extreme and lawless extortion to have obtained the vast amount of money necessary to enable him to supply such unbounded and reckless waste.

There was another way, too, by which Cæsar turned public opinion strongly against himself, by the very means which he adopted for creating a sentiment in his favor. The Romans, among the other barbarous amusements which were practiced in the city, were specially fond of combats. These combats were of various kinds. They were fought sometimes between ferocious beasts of the same or of different species, as dogs against each other, or against bulls, lions, or tigers. Any animals, in fact, were employed for this purpose, that could be teased or goaded into anger and ferocity in a fight. Sometimes men were employed in these combats--captive soldiers, that had been taken in war, and brought to Rome to fight in the amphitheaters there as gladiators. These men were compelled to contend sometimes with wild beasts, and sometimes with one another. Cæsar, knowing how highly the Roman assemblies enjoyed such scenes, determined to afford them the indulgence on a most magnificent scale, supposing, of course, that the greater and the more dreadful the fight, the higher would be the pleasure which the spectators would enjoy in

witnessing it. Accordingly, in making preparations for the festivities attending his triumph, he caused a large artificial lake to be formed at a convenient place in the vicinity of Rome, where it could be surrounded by the populace of the city, and there he made arrangements for a naval battle. A great number of galleys were introduced into the lake. They were of the usual size employed in war. These galleys were manned with numerous soldiers. Tyrian captives were put upon one side, and Egyptian upon the other; and when all was ready, the two squadrons were ordered to approach and fight a real naval battle for the amusement of the enormous throngs of spectators that were assembled around. As the nations from which the combatants in this conflict were respectively taken were hostile to each other, and as the men fought, of course, for their lives, the engagement was attended with the usual horrors of a desperate naval encounter. Hundreds were slain. The dead bodies of the combatants fell from the galleys into the lake, and the waters of it were dyed with their blood.

There were land combats, too, on the same grand scale. In one of them five hundred foot soldiers, twenty elephants, and a troop of thirty horse were engaged on each side. This combat, therefore, was an action greater, in respect to the number of the combatants, than the famous battle of Lexington, which marked the commencement of the American war; and in respect to the slaughter which took place, it was very probably ten times greater. The horror of these scenes proved to be too much even for the populace, fierce and merciless as it was, which they were intended to amuse. Cæsar, in his eagerness to outdo all former exhibitions and shows, went beyond the limits within which the seeing of men butchered in bloody combats and dying in agony and despair would serve for a pleasure and a pastime. The people were shocked; and condemnations of Cæsar's cruelty were added to the other suppressed reproaches and criminations which every where arose.

Cleopatra, during her visit to Rome, lived openly with Cæsar at his residence, and this excited very general displeasure. In fact, while the people pitied Arsinoë, Cleopatra, notwithstanding her beauty and her thousand personal accomplishments and charms, was an object of general displeasure, so far as public attention was turned toward her at all. The public mind was, however, much engrossed by the great political movements made by Cæsar and the ends toward which he seemed to be aiming. Men accused him of designing to be made a king. Parties were formed for and against him; and though men did not dare openly to utter their sentiments, their passions became the more violent in proportion to the external force by which they were suppressed. Mark Antony was at Rome at this time. He warmly espoused Cæsar's cause, and encouraged his design of making himself king. He once, in fact, offered to place a royal diadem upon Cæsar's head at some public celebration; but the marks of public disapprobation which the act elicited caused him to desist.

At length, however, the time arrived when Cæsar determined to cause himself to be proclaimed king. He took advantage of a certain remarkable conjuncture of public affairs, which can not here be particularly described, but which seemed to him specially to favor his designs, and arrangements were made for having him invested with the regal power by the senate. The murmurs and the discontent of the people at the indications that the time for the realization of their fears was drawing nigh, became more and more audible, and at length a conspiracy was formed to put an end to the danger by destroying the ambitious aspirant's life. Two stern and determined men, Brutus and Cassius, were the leaders of this conspiracy. They matured their plans, organized their band of associates, provided themselves secretly with arms, and when the senate convened, on the day in which the decisive vote was to have been passed, Cæsar himself presiding, they came up boldly around him in his presidential chair, and murdered him with their daggers.

Antony, from whom the plans of the conspirators had been kept profoundly secret, stood by, looking on stupefied and confounded while the deed was done, but utterly unable to render his friend any protection.

Cleopatra immediately fled from the city and returned to Egypt.

Arsinoë had gone away before. Cæsar, either taking pity on her misfortunes, or impelled, perhaps, by the force of public sentiment, which seemed inclined to take part with her against him, set her at liberty immediately after the ceremonies of his triumph were over. He would not, however, allow her to return into Egypt, for fear, probably, that she might in some way or other be the means of disturbing the government of Cleopatra. She proceeded, accordingly, into Syria, no longer as a captive, but still as an exile from her native land. We shall hereafter learn what became of her there.

Calpurnia mourned the death of her husband with sincere and unaffected grief. She bore the wrongs which she suffered as a wife with a very patient and unrepining spirit, and loved her husband with the most devoted attachment to the end. Nothing can be more affecting than the proofs of her tender and anxious regard on the night immediately preceding the assassination. There were certain slight and obscure indications of danger which her watchful devotion to her husband led her to observe, though they eluded

the notice of all Cæsar's other friends, and they filled her with apprehension and anxiety; and when at length the bloody body was brought home to her from the senate-house, she was overwhelmed with grief and despair.

She had no children. She accordingly looked upon Mark Antony as her nearest friend and protector, and in the confusion and terror which prevailed the next day in the city, she hastily packed together the money and other valuables contained in the house, and all her husband's books and papers, and sent them to Antony for safe keeping.

CHAPTER IX.

THE BATTLE OF PHILIPPI.

When the tidings of the assassination of Cæsar were first announced to the people of Rome, all ranks and classes of men were struck with amazement and consternation. No one knew what to say or do. A very large and influential portion of the community had been Cæsar's friends. It was equally certain that there was a very powerful interest opposed to him. No one could foresee which of these two parties would now carry the day, and, of course, for a time, all was uncertainty and indecision.

Mark Antony came forward at once, and assumed the position of Cæsar's representative and the leader of the party on that side. A will was found among Cæsar's effects, and when the will was opened it appeared that large sums of money were left to the Roman people, and other large amounts to a nephew of the deceased, named Octavius, who will be more particularly spoken of hereafter. Antony was named in the will as the executor of it. This and other circumstances seemed to authorize him to come forward as the head and the leader of the Cæsar party. Brutus and Cassius, who remained openly in the city after their desperate deed had been performed, were the acknowledged leaders of the other party; while the mass of the people were at first so astounded at the magnitude and suddenness of the revolution which the open and public assassination of a Roman emperor by a Roman senate denoted, that they knew not what to say or do. In fact, the killing of Julius Cæsar, considering the exalted position which he occupied, the rank and station of the men who perpetrated the deed, and the very extraordinary publicity of the scene in which the act was performed, was, doubtless, the most conspicuous and most appalling case of assassination that has ever occurred. The whole population of Rome seemed for some days to be amazed and stupefied by the tidings. At length, however, parties began to be more distinctly formed. The lines of demarkation between them were gradually drawn, and men began to arrange themselves more and more unequivocally on the opposite sides.

For a short time the supremacy of Antony over the Cæsar party was readily acquiesced in and allowed. At length, however, and before his arrangements were finally matured, he found that he had two formidable competitors upon his own side. These were Octavius and Lepidus.

Octavius, who was the nephew of Cæsar, already alluded to, was a very accomplished and elegant young man, now about nineteen years of age. He was the son of Julius Cæsar's niece.[6] He had always been a great favorite with his uncle. Every possible attention had been paid to his education, and he had been advanced by Cæsar, already, to positions of high importance in public life. Cæsar, in fact, adopted him as his son, and made him his heir. At the time of Cæsar's death he was at Apollonia, a city of Illyricum, north of Greece. The troops under his command there offered to march at once with him, if he wished it, to Rome, and avenge his uncle's death. Octavius, after some hesitation, concluded that it would be most prudent for him to proceed thither first himself, alone, as a private person, and demand his rights as his uncle's heir, according to the provisions of the will. He accordingly did so. He found, on his arrival, that the will, the property, the books and parchments, and the substantial power of the government, were all in Antony's hands. Antony, instead of putting Octavius into possession of his property and rights, found various pretexts for evasion and delay. Octavius was too young yet, he said, to assume such weighty responsibilities. He was himself also too much pressed with the urgency of public affairs to attend to the business of the will. With these and similar excuses as his justification, Antony seemed inclined to pay no regard whatever to Octavius's claims.

Octavius, young as he was, possessed a character that was marked with great intelligence, spirit, and resolution. He soon made many powerful friends in the city of Rome and among the Roman senate. It became a serious question whether he or Antony would gain the greatest ascendency in the party of Cæsar's friends. The contest for this ascendency was, in fact, protracted for two or three years, and led to a vast complication of intrigues, and maneuvers, and civil wars, which can not, however, be here particularly detailed.

The other competitor which Antony had to contend with was a distinguished Roman general named Lepidus. Lepidus was an officer of the army, in very high command at the time of Cæsar's death. He was present in the senate chamber on the day of the

assassination. He stole secretly away when he saw that the deed was done, and repaired to the camp of the army without the city and immediately assumed the command of the forces. This gave him great power, and in the course of the contests which subsequently ensued between Antony and Octavius, he took an active part, and held in some measure the balance between them. At length the contest was finally closed by a coalition of the three rivals. Finding that they could not either of them gain a decided victory over the others, they combined together, and formed the celebrated _triumvirate_, which continued afterward for some time to wield the supreme command in the Roman world. In forming this league of reconciliation, the three rivals held their conference on an island situated in one of the branches of the Po, in the north of Italy. They manifested extreme jealousy and suspicion of each other in coming to this interview. Two bridges were built leading to the island, one from each bank of the stream. The army of Antony was drawn up upon one side of the river, and that of Octavius upon the other. Lepidus went first to the island by one of the bridges. After examining the ground carefully, to make himself sure that it contained no ambuscade, he made a signal to the other generals, who then came over, each advancing by his own bridge, and accompanied by three hundred guards, who remained upon the bridge to secure a retreat for their master in case of treachery. The conference lasted three days, at the expiration of which time the articles were all agreed upon and signed.

This league being formed, the three confederates turned their united force against the party of the conspirators. Of this party Brutus and Cassius were still at the head.

The scene of the contests between Octavius, Antony, and Lepidus had been chiefly Italy and the other central countries of Europe. Brutus and Cassius, on the other hand, had gone across the Adriatic Sea into the East immediately after Cæsar's assassination. They were now in Asia Minor, and were employed in concentrating their forces, forming alliances with the various Eastern powers, raising troops, bringing over to their side the Roman legions which were stationed in that quarter of the world, seizing magazines, and exacting contributions from all who could be induced to favor their cause. Among other embassages which they sent, one went to Egypt to demand aid from Cleopatra. Cleopatra, however, was resolved to join the other side in the contest. It was natural that she should feel grateful to Cæsar for his efforts and sacrifices in her behalf, and that she should be inclined to favor the cause of his friends. Accordingly, instead of sending troops to aid Brutus and Cassius, as they had desired her to do, she immediately fitted out an expedition to proceed to the coast of Asia, with a view of rendering all the aid in her power to Antony's cause.

Cassius, on his part, finding that Cleopatra was determined on joining his enemies, immediately resolved on proceeding at once to Egypt and taking possession of the country. He also stationed a military force at Tænarus, the southern promontory of Greece, to watch for and intercept the fleet of Cleopatra as soon as it should appear on the European shores. All these plans, however--both those which Cleopatra formed against Cassius, and those which Cassius formed against her--failed of accomplishment. Cleopatra's fleet encountered a terrible storm, which dispersed and destroyed it. A small remnant was driven upon the coast of Africa, but nothing could be saved which could be made available for the purpose intended. As for Cassius's intended expedition to Egypt, it was not carried into effect. The dangers which began now to threaten him from the direction of Italy and Rome were so imminent, that, at Brutus's urgent request, he gave up the Egyptian plan, and the two generals concentrated their forces to meet the armies of the triumvirate which were now rapidly advancing to attack them. They passed for this purpose across the Hellespont from Sestos to Abydos, and entered Thrace.[7]

After various marches and countermarches, and a long succession of those maneuvers by which two powerful armies, approaching a contest, endeavor each to gain some position of advantage against the other, the various bodies of troops belonging, respectively, to the two powers, came into the vicinity of each other near Philippi. Brutus and Cassius arrived here first. There was a plain in the neighborhood of the city, with a rising ground in a certain portion of it. Brutus took possession of this elevation, and intrenched himself there. Cassius posted his forces about three miles distant, near the sea. There was a line of intrenchments between the two camps, which formed a chain of communication by which the positions of the two commanders were connected. The armies were thus very advantageously posted. They had the River Strymon and a marsh on the left of the ground that they occupied, while the plain was before them, and the sea behind. Here they awaited the arrival of their foes.

Antony, who was at this time at Amphipolis, a city not far distant from Philippi, learning that Brutus and Cassius had taken their positions in anticipation of an attack, advanced immediately and encamped upon the plain. Octavius was detained by sickness at the city of Dyrrachium, not very far distant. Antony waited for him. It was ten days before he came. At length he arrived, though in coming he had to be borne upon a litter, being still too sick to travel in any other way. Antony approached, and established his camp opposite to that of Cassius, near the sea, while Octavius took post opposite to Brutus. The four armies then paused, contemplating the probable results of the engagement that was about to ensue.

The forces on the two sides were nearly equal; but on the Republican side, that is, on the part of Brutus and Cassius, there was great inconvenience and suffering for want of a sufficient supply of provisions and stores. There was some difference of opinion between Brutus and Cassius in respect to what it was best for them to do. Brutus was inclined to give the enemy battle. Cassius was reluctant to do so, since, under the circumstances in which they were placed, he considered it unwise to hazard, as they necessarily must do, the whole success of their cause to the chances of a single battle. A council of war was convened, and the various officers were asked to give their opinions. In this conference, one of the officers having recommended to postpone the conflict to the next winter, Brutus asked him what advantage he hoped to attain by such delay. "If I gain nothing else," replied the officer, "I shall live so much the longer." This answer touched Cassius's pride and military sense of honor. Rather than concur in a counsel which was thus, on the part of one of its advocates at least, dictated by what he considered an inglorious love of life, he preferred to retract his opinion. It was agreed by the council that the army should maintain its ground and give the enemy battle. The officers then repaired to their respective camps.

Brutus was greatly pleased at this decision. To fight the battle had been his original desire, and as his counsels had prevailed, he was, of course, gratified with the prospect for the morrow. He arranged a sumptuous entertainment in his tent, and invited all the officers of his division of the army to sup with him. The party spent the night in convivial pleasures, and in mutual congratulations at the prospect of the victory which, as they believed, awaited them on the morrow. Brutus entertained his guests with brilliant conversation all the evening, and inspired them with his own confident anticipations of success in the conflict which was to ensue.

Cassius, on the other hand, in his camp by the sea, was silent and desponding. He supped privately with a few intimate friends. On rising from the table, he took one of his officers aside, and, pressing his hand, said to him that he felt great misgivings in respect to the result of the contest. "It is against my judgment," said he, "that we thus hazard the liberty of Rome on the event of one battle, fought under such circumstances as these. Whatever is the result, I wish you to bear me witness hereafter that I was forced into this measure by circumstances that I could not control. I suppose, however, that I ought to take courage, notwithstanding the reasons that I have for these gloomy forebodings. Let us, therefore, hope for the best; and come and sup with me again to-morrow night. To-morrow is my birth-day."

The next morning, the scarlet mantle--the customary signal displayed in Roman camps on the morning of a day of battle--was seen at the tops of the tents of the two commanding generals, waving there in the air like a banner. While the troops, in obedience to this signal, were preparing themselves for the conflict, the two generals went to meet each other at a point midway between their two encampments, for a final consultation and agreement in respect to the arrangements of the day. When this business was concluded, and they were about to separate, in order to proceed each to his own sphere of duty, Cassius asked Brutus what he intended to do in case the day should go against them. "We hope for the best," said he, "and pray that the gods may grant us the victory in this most momentous crisis. But we must remember that it is the greatest and the most momentous of human affairs that are always the most uncertain, and we can not foresee what is to-day to be the result of the battle. If it goes against us, what do you intend to do? Do you intend to escape, or to die?"

"When I was a young man," said Brutus, in reply, "and looked at this subject only as a question of theory, I thought it wrong for a man ever to take his own life. However great the evils that threatened him, and however desperate his condition, I considered it his duty to live, and to wait patiently for better times. But now, placed in the position in which I am, I see the subject in a different light. If we do not gain the battle this day, I shall consider all hope and possibility of saving our country forever gone, and I shall not leave the field of battle alive."

Cassius, in his despondency, had made the same resolution for himself before, and he was rejoiced to hear Brutus utter these sentiments. He grasped his colleague's hand with a countenance expressive of the greatest animation and pleasure, and bade him farewell, saying, "We will go out boldly to face the enemy. For we are certain either that we shall conquer them, or that we shall have nothing to fear from their victory over us."

Cassius's dejection, and the tendency of his mind to take a despairing view of the prospects of the cause in which he was engaged, were owing, in some measure, to certain unfavorable omens which he had observed. These omens, though really frivolous and wholly unworthy of attention, seem to have had great influence upon him, notwithstanding his general intelligence, and the remarkable strength and energy of his character. They were as follows:

In offering certain sacrifices, he was to wear, according to the usage prescribed on such occasions, a garland of flowers, and it happened that the officer who brought the garland, by mistake or accident, presented it wrong side before. Again, in some

procession which was formed, and in which a certain image of gold, made in honor of him, was borne, the bearer of it stumbled and fell, and the image was thrown upon the ground. This was a very dark presage of impending calamity. Then a great number of vultures and other birds of prey were seen, for a number of days before the battle, hovering over the Roman army; and several swarms of bees were found within the precincts of the camp. So alarming was this last indication, that the officers altered the line of the intrenchments so as to shut out the ill-omened spot from the camp. These and other such things had great influence upon the mind of Cassius, in convincing him that some great disaster was impending over him.

Nor was Brutus himself without warnings of this character, though they seem to have had less power to produce any serious impression upon his mind than in the case of Cassius. The most extraordinary warning which Brutus received, according to the story of his ancient historians, was by a supernatural apparition which he saw, some time before, while he was in Asia Minor. He was encamped near the city of Sardis at that time. He was always accustomed to sleep very little, and would often, it was said, when all his officers had retired, and the camp was still, sit alone in his tent, sometimes reading, and sometimes revolving the anxious cares which were always pressing upon his mind. One night he was thus alone in his tent, with a small lamp burning before him, sitting lost in thought, when he suddenly heard a movement as of some one entering the tent. He looked up, and saw a strange, unearthly, and monstrous shape, which appeared to have just entered the door and was coming toward him. The spirit gazed upon him as it advanced, but it did not speak.

Brutus, who was not much accustomed to fear, boldly demanded of the apparition who and what it was, and what had brought it there. "I am your evil spirit," said the apparition. "I shall meet you at Philippi." "Then, it seems," said Brutus, "that, at any rate, I shall see you again." The spirit made no reply to this, but immediately vanished.

Brutus arose, went to the door of his tent, summoned the sentinels, and awakened the soldiers that were sleeping near. The sentinels had seen nothing; and, after the most diligent search, no trace of the mysterious visitor could be found.

The next morning Brutus related to Cassius the occurrence which he had witnessed. Cassius, though very sensitive, it seems, to the influence of omens affecting himself, was quite philosophical in his views in respect to those of other men. He argued very rationally with Brutus to convince him that the vision which he had seen was only a phantom of sleep, taking its form and character from the ideas and images which the situation in which Brutus was then placed, and the fatigue and anxiety which he had endured, would naturally impress upon his mind.

But to return to the battle. Brutus fought against Octavius; while Cassius, two or three miles distant, encountered Antony, that having been, as will be recollected, the disposition of the respective armies and their encampments upon the plain. Brutus was triumphantly successful in his part of the field. His troops defeated the army of Octavius, and got possession of his camp. The men forced their way into Octavius's tent, and pierced the litter in which they supposed that the sick general was lying through and through with their spears. But the object of their desperate hostility was not there. He had been borne away by his guards a few minutes before, and no one knew what had become of him.

The result of the battle was, however, unfortunately for those whose adventures we are now more particularly following, very different in Cassius's part of the field. When Brutus, after completing the conquest of his own immediate foes, returned to his elevated camp, he looked toward the camp of Cassius, and was surprised to find that the tents had disappeared. Some of the officers around perceived weapons glancing and glittering in the sun in the place where Cassius's tents ought to appear. Brutus now suspected the truth, which was, that Cassius had been defeated, and his camp had fallen into the hands of the enemy. He immediately collected together as large a force as he could command, and marched to the relief of his colleague. He found him, at last, posted with a small body of guards and attendants upon the top of a small elevation to which he had fled for safety. Cassius saw the troop of horsemen which Brutus sent forward coming toward him, and supposed that it was a detachment from Antony's army advancing to capture him. He, however, sent a messenger forward to meet them, and ascertain whether they were friends or foes. The messenger, whose name was Titinius, rode down. The horsemen recognized Titinius, and, riding up eagerly around him, they dismounted from their horses to congratulate him on his safety, and to press him with inquiries in respect to the result of the battle and the fate of his master.

Cassius, seeing all this, but not seeing it very distinctly, supposed that the troop of horsemen were enemies, and that they had surrounded Titinius, and had cut him down or made him prisoner. He considered it certain, therefore, that all was now finally lost. Accordingly, in execution of a plan which he had previously formed, he called a servant, named Pindarus, whom he directed to follow him, and went into a tent which was near. When Brutus and his horsemen came up, they entered the tent. They found no

living person within; but the dead body of Cassius was there, the head being totally dissevered from it. Pindarus was never afterward to be found.

Brutus was overwhelmed with grief at the death of his colleague; he was also oppressed by it with a double burden of responsibility and care, since now the whole conduct of affairs devolved upon him alone. He found himself surrounded with difficulties which became more and more embarrassing every day. At length he was compelled to fight a second battle. The details of the contest itself we can not give, but the result of it was, that, notwithstanding the most unparalleled and desperate exertions made by Brutus to keep his men to the work, and to maintain his ground, his troops were borne down and overwhelmed by the irresistible onsets of his enemies, and his cause was irretrievably and hopelessly ruined.

When Brutus found that all was lost, he allowed himself to be conducted off the field by a small body of guards, who, in their retreat, broke through the ranks of the enemy on a side where they saw that they should meet with the least resistance. They were, however, pursued by a squadron of horse, the horsemen being eager to make Brutus a prisoner. In this emergency, one of Brutus's friends, named Lucilius, conceived the design of pretending to be Brutus, and, as such, surrendering himself a prisoner. This plan he carried into effect. When the troop came up, he called out for quarter, said that he was Brutus, and begged them to spare his life, and to take him to Antony. The men did so, rejoiced at having, as they imagined, secured so invaluable a prize.

In the mean time, the real Brutus pressed on to make his escape. He crossed a brook which came in his way, and entered into a little dell, which promised to afford a hiding-place, since it was encumbered with precipitous rocks and shaded with trees. A few friends and officers accompanied Brutus in his flight. Night soon came on, and he lay down in a little recess under a shelving rock, exhausted with fatigue and suffering. Then, raising his eyes to heaven, he imprecated, in lines quoted from a Greek poet, the just judgment of God upon the foes who were at that hour triumphing in what he considered the ruin of his country.

He then, in his anguish and despair, enumerated by name the several friends and companions whom he had seen fall that day in battle, mourning the loss of each with bitter grief. In the mean time, night was coming on, and the party, concealed thus in the wild dell, were destitute and unsheltered. Hungry and thirsty, and spent with fatigue as they were, there seemed to be no prospect for them of either rest or refreshment. Finally they sent one of their number to steal softly back to the rivulet which they had crossed in their retreat, to bring them some water. The soldier took his helmet to bring the water in, for want of any other vessel. While Brutus was drinking the water which they brought, a noise was heard in the opposite direction. Two of the officers were sent to ascertain the cause. They came back soon, reporting that there was a party of the enemy in that quarter. They asked where the water was which had been brought. Brutus told them that it had all been drank, but that he would send immediately for more. The messenger went accordingly to the brook again, but he came back very soon, wounded and bleeding, and reported that the enemy was close upon them on that side too, and that he had narrowly escaped with his life. The apprehensions of Brutus's party were greatly increased by these tidings: it was evident that all hope of being able to remain long concealed where they were must fast disappear.

One of the officers, named Statilius, then proposed to make the attempt to find his way out of the snare in which they had become involved. He would go, he said, as cautiously as possible, avoiding all parties of the enemy, and being favored by the darkness of the night, he hoped to find some way of retreat. If he succeeded, he would display a torch on a distant elevation which he designated, so that the party in the glen, on seeing the light, might be assured of his safety. He would then return and guide them all through the danger, by the way which he should have discovered.

This plan was approved, and Statilius accordingly departed. In due time the light was seen burning at the place which had been pointed out, and indicating that Statilius had accomplished his undertaking. Brutus and his party were greatly cheered by the new hope which this result awakened. They began to watch and listen for their messenger's return. They watched and waited long, but he did not come. On the way back he was intercepted and slain.

When at length all hope that he would return was finally abandoned, some of the party, in the course of the despairing consultations which the unhappy fugitives held with one another, said that they _must not_ remain any longer where they were, but must make their escape from that spot at all hazards. "Yes," said Brutus, "we must indeed make our escape from our present situation, but we must do it with our hands, and not with our feet." He meant by this that the only means now left to them to evade their enemies was self-destruction. When his friends understood that this was his meaning, and that he was resolved to put this design into execution in his own case, they were overwhelmed with sorrow. Brutus took them, one by one, by the hand and bade them farewell. He thanked them for their fidelity in adhering to his cause to the last, and said that it was a source of great comfort and satisfaction to

him that all his friends had proved so faithful and true. "I do not complain of my hard fate," he added, "so far as I myself am concerned. I mourn only for my unhappy country. As to myself, I think that my condition even now is better than that of my enemies; for, though I die, posterity will do me justice, and I shall enjoy forever the honor which virtue and integrity deserve; while they, though they live, live only to reap the bitter fruits of injustice and of tyranny.

"After I am gone," he continued, addressing his friends, as before, "think no longer of me, but take care of yourselves. Antony, I am sure, will be satisfied with Cassius's death and mine. He will not be disposed to pursue you vindictively any longer. Make peace with him on the best terms that you can."

Brutus then asked first one and then another of his friends to aid him in the last duty, as he seems to have considered it, of destroying his life; but one after another declared that they could not do any thing to assist him in carrying into effect so dreadful a determination. Finally, he took with him an old and long-tried friend named Strato, and went away a little, apart from the rest. Here he solicited once more the favor which had been refused him before--begging that Strato would hold out his sword. Strato still refused. Brutus then called one of his slaves. Upon this Strato declared that he would do any thing rather than that Brutus should die by the hand of a slave. He took the sword, and with his right hand held it extended in the air. With the left hand he covered his eyes, that he might not witness the horrible spectacle. Brutus rushed upon the point of the weapon with such fatal force that he fell and immediately expired.

Thus ended the great and famous battle of Philippi, celebrated in history as marking the termination of the great conflict between the friends and the enemies of Cæsar, which agitated the world so deeply after the conqueror's death. This battle established the ascendency of Antony, and made him for a time the most conspicuous man, as Cleopatra was the most conspicuous woman, in the world.

CHAPTER X.

CLEOPATRA AND ANTONY.

How far Cleopatra was influenced, in her determination to espouse the cause of Antony rather than that of Brutus and Cassius, in the civil war described in the last chapter, by gratitude to Cæsar, and how far, on the other hand, by personal interest in Antony, the reader must judge. Cleopatra had seen Antony, it will be recollected, some years before, during his visit to Egypt, when she was a young girl. She was doubtless well acquainted with his character. It was a character peculiarly fitted, in some respects, to captivate the imagination of a woman so ardent, and impulsive, and bold as Cleopatra was fast becoming.

Antony had, in fact, made himself an object of universal interest throughout the world, by his wild and eccentric manners and reckless conduct, and by the very extraordinary vicissitudes which had marked his career. In moral character he was as utterly abandoned and depraved as it was possible to be. In early life, as has already been stated, he plunged into such a course of dissipation and extravagance that he became utterly and hopelessly ruined; or, rather, he would have been so, had he not, by the influence of that magic power of fascination which such characters often possess, succeeded in gaining a great ascendency over a young man of immense fortune, named Curio, who for a time upheld him by becoming surety for his debts. This resource, however, soon failed, and Antony was compelled to abandon Rome, and to live for some years as a fugitive and exile, in dissolute wretchedness and want. During all the subsequent vicissitudes through which he passed in the course of his career, the same habits of lavish expenditure continued, whenever he had funds at his command. This trait in his character took the form sometimes of a noble generosity. In his campaigns, the plunder which he acquired he usually divided among his soldiers, reserving nothing for himself. This made his men enthusiastically devoted to him, and led them to consider his prodigality as a virtue, even when they did not themselves derive any direct advantage from it. A thousand stories were always in circulation in camp of acts on his part illustrating his reckless disregard of the value of money, some ludicrous, and all eccentric and strange.

In his personal habits, too, he was as different as possible from other men. He prided himself on being descended from Hercules, and he affected a style of dress and a general air and manner in accordance with the savage character of this his pretended ancestor. His features were sharp, his nose was arched and prominent, and he wore his hair and beard very long--as long, in fact, as he could make them grow. These peculiarities imparted to his countenance a very wild and ferocious expression. He adopted a style of dress, too, which, judged of with reference to the prevailing fashions of the time, gave to his whole appearance a rough, savage, and reckless air. His manner and demeanor corresponded with his dress and appearance. He lived in habits of the most unreserved familiarity with his soldiers. He associated freely with them, ate and drank with them in the open air, and joined in their

noisy mirth and rude and boisterous hilarity. His commanding powers of mind, and the desperate recklessness of his courage, enabled him to do all this without danger. These qualities inspired in the minds of the soldiers a feeling of profound respect for their commander; and this good opinion he was enabled to retain, notwithstanding such habits of familiarity with his inferiors as would have been fatal to the influence of an ordinary man.

In the most prosperous portion of Antony's career--for example, during the period immediately preceding the death of Cæsar--he addicted himself to vicious indulgences of the most open, public, and shameless character. He had around him a sort of court, formed of jesters, tumblers, mountebanks, play-actors, and other similar characters of the lowest and most disreputable class. Many of these companions were singing and dancing girls, very beautiful, and very highly accomplished in the arts of their respective professions, but all totally corrupt and depraved. Public sentiment, even in that age and nation, strongly condemned this conduct. The people were pagans, it is true, but it is a mistake to suppose that the formation of a moral sentiment in the community against such vices as these is a work which Christianity alone can perform. There is a law of nature, in the form of an instinct universal in the race, imperiously enjoining that the connection of the sexes shall consist of the union of one man with one woman, and that woman his wife, and very sternly prohibiting every other. So that there has probably never been a community in the world so corrupt, that a man could practice in it such vices as those of Antony, without not only violating his own sense of right and wrong, but also bringing upon himself the general condemnation of those around him.

Still, the world are prone to be very tolerant in respect to the vices of the great. Such exalted personages as Antony seem to be judged by a different standard from common men. Even in the countries where those who occupy high stations of trust or of power are actually selected, for the purpose of being placed there, by the voices of their fellow-men, all inquiry into the personal character of a candidate is often suppressed, such inquiry being condemned as wholly irrelevant and improper, and they who succeed in attaining to power enjoy immunities in their elevation which are denied to common men.

But, notwithstanding the influence of Antony's rank and power in shielding him from public censure, he carried his excesses to such an extreme that his conduct was very loudly and very generally condemned. He would spend all the night in carousals, and then, the next day, would appear in public, staggering in the streets. Sometimes he would enter the tribunals for the transaction of business when he was so intoxicated that it would be necessary for friends to come to his assistance to conduct him away. In some of his journeys in the neighborhood of Rome, he would take a troop of companions with him of the worst possible character, and travel with them openly and without shame. There was a certain actress, named Cytheride, whom he made his companion on one such occasion. She was borne upon a litter in his train, and he carried about with him a vast collection of gold and silver plate, and of splendid table furniture, together with an endless supply of luxurious articles of food and of wine, to provide for the entertainments and banquets which he was to celebrate with her on the journey. He would sometimes stop by the road side, pitch his tents, establish his kitchens, set his cooks at work to prepare a feast, spread his tables, and make a sumptuous banquet of the most costly, complete, and ceremonious character--all to make men wonder at the abundance and perfection of the means of luxury which he could carry with him wherever he might go. In fact, he always seemed to feel a special pleasure in doing strange and extraordinary things in order to excite surprise. Once on a journey he had lions harnessed to his carts to draw his baggage, in order to create a sensation.

Notwithstanding the heedlessness with which Antony abandoned himself to these luxurious pleasures when at Rome, no man could endure exposure and hardship better when in camp or on the field. In fact, he rushed with as much headlong precipitation into difficulty and danger when abroad, as into expense and dissipation when at home. During his contests with Octavius and Lepidus, after Cæsar's death, he once had occasion to pass the Alps, which, with his customary recklessness, he attempted to traverse without any proper supplies of stores or means of transportation. He was reduced, on the passage, together with the troops under his command, to the most extreme destitution and distress. They had to feed on roots and herbs, and finally on the bark of trees; and they barely preserved themselves, by these means, from actual starvation. Antony seemed, however, to care nothing for all this, but pressed on through the difficulty and danger, manifesting the same daring and determined unconcern to the end. In the same campaign he found himself at one time reduced to extreme destitution in respect to men. His troops had been gradually wasted away until his situation had become very desperate. He conceived, under these circumstances, the most extraordinary idea of going over alone to the camp of Lepidus and enticing away his rival's troops from under the very eyes of their commander. This bold design was successfully executed. Antony advanced alone, clothed in wretched garments, and with his matted hair and beard hanging about his breast and shoulders, up to Lepidus's lines. The men, who knew him well, received him with acclamations; and pitying the sad condition to which they saw that he was reduced, began to listen to what he had to say. Lepidus, who could not attack him, since he and Antony were not at that time in open hostility to each other, but were only rival

commanders in the same army, ordered the trumpeters to sound, in order to make a noise which should prevent the words of Antony from being heard. This interrupted the negotiation; but the men immediately disguised two of their number in female apparel, and sent them to Antony to make arrangements with him for putting themselves under his command, and offering, at the same time, to murder Lepidus, if he would but speak the word. Antony charged them to do Lepidus no injury. He, however, went over and took possession of the camp, and assumed the command of the army. He treated Lepidus himself, personally, with extreme politeness, and retained him as a subordinate under his command.

Not far from the time of Cæsar's death, Antony was married. The name of the lady was Fulvia. She was a widow at the time of her marriage with Antony, and was a woman of very marked and decided character. She had led a wild and irregular life previous to this time, but she conceived a very strong attachment to her new husband, and devoted herself to him from the time of her marriage with the most constant fidelity. She soon acquired a very great ascendency over him, and was the means of effecting a very considerable reform in his conduct and character. She was an ambitious and aspiring woman, and made many very efficient and successful efforts to promote the elevation and aggrandizement of her husband. She appeared, also, to take a great pride and pleasure in exercising over him, herself, a great personal control. She succeeded in these attempts in a manner that surprised every body. It seemed astonishing to all mankind that such a tiger as he had been could be subdued by any human power. Nor was it by gentleness and mildness that Fulvia gained such power over her husband. She was of a very stern and masculine character, and she seems to have mastered Antony by surpassing him in the use of his own weapons. In fact, instead of attempting to soothe and mollify him, she reduced him, it seems, to the necessity of resorting to various contrivances to soften and propitiate her. Once, for example, on his return from a campaign in which he had been exposed to great dangers, he disguised himself and came home at night in the garb of a courier bearing dispatches. He caused himself to be ushered, muffled and disguised as he was, into Fulvia's apartments, where he handed her some pretended letters, which, he said, were from her husband; and while Fulvia was opening them in great excitement and trepidation, he threw off his disguise, and revealed himself to her by clasping her in his arms and kissing her in the midst of her amazement.

Antony's marriage with Fulvia, besides being the means of reforming his morals in some degree, softened and civilized him in respect to his manners. His dress and appearance now assumed a different character. In fact, his political elevation after Cæsar's death soon became very exalted, and the various democratic arts by which he had sought to raise himself to it, being now no longer necessary, were, as usual in such cases, gradually discarded. He lived in great style and splendor when at Rome, and when absent from home, on his military campaigns, he began to exhibit the same pomp and parade in his equipage and in his arrangements as were usual in the camps of other Roman generals.

After the battle of Philippi, described in the last chapter, Antony--who, with all his faults, was sometimes a very generous foe--as soon as the tidings of Brutus's death were brought to him, repaired immediately to the spot, and appeared to be quite shocked and concerned at the sight of the body. He took off his own military cloak or mantle--which was a very magnificent and costly garment, being enriched with many expensive ornaments--and spread it over the corpse. He then gave directions to one of the officers of his household to make arrangements for funeral ceremonies of a very imposing character, as a testimony of his respect for the memory of the deceased. In these ceremonies it was the duty of the officer to have burned the military cloak which Antony had appropriated to the purpose of a pall, with the body. He did not, however, do so. The cloak being very valuable, he reserved it; and he withheld, also, a considerable part of the money which had been given him for the expenses of the funeral. He supposed that Antony would probably not inquire very closely into the details of the arrangements made for the funeral of his most inveterate enemy. Antony, however, did inquire into them, and when he learned what the officer had done, he ordered him to be killed.

The various political changes which occurred, and the movements which took place among the several armies after the battle of Philippi, can not be here detailed. It is sufficient to say that Antony proceeded to the eastward through Asia Minor, and in the course of the following year came into Cilicia. From this place he sent a messenger to Egypt to Cleopatra, summoning her to appear before him. There were charges, he said, against her, of having aided Cassius and Brutus in the late war instead of rendering assistance to him. Whether there really were any such charges, or whether they were only fabricated by Antony as pretexts for seeing Cleopatra, the fame of whose beauty was very widely extended, does not certainly appear. However this may be, he sent to summon the queen to come to him. The name of the messenger whom Antony dispatched on this errand was Dellius. Fulvia, Antony's wife, was not with him at this time. She had been left behind at Rome.

Dellius proceeded to Egypt and appeared at Cleopatra's court. The queen was at this time about twenty-eight years old, but more beautiful, as was said, than ever before. Dellius was very much struck with her beauty, and with a certain fascination in her voice and conversation, of which her ancient biographers often speak as one of the most irresistible of her charms. He told her that she

need have no fear of Antony. It was of no consequence, he said, what charges there might be against her. She would find that, in a very few days after she had entered into Antony's presence, she would be in great favor. She might rely, in fact, he said, on gaining, very speedily, an unbounded ascendency over the general. He advised her, therefore, to proceed to Cilicia without fear, and to present herself before Antony in as much pomp and magnificence as she could command. He would answer, he said, for the result.

Cleopatra determined to follow this advice. In fact, her ardent and impulsive imagination was fired with the idea of making, a second time, the conquest of the greatest general and highest potentate in the world. She began immediately to make provision for the voyage. She employed all the resources of her kingdom in procuring for herself the most magnificent means of display, such as expensive and splendid dresses, rich services of plate, ornaments of precious stones and of gold, and presents in great variety and of the most costly description for Antony. She appointed, also, a numerous retinue of attendants to accompany her, and, in a word, made all the arrangements complete for an expedition of the most imposing and magnificent character. While these preparations were going forward, she received new and frequent communications from Antony, urging her to hasten her departure; but she paid very little attention to them. It was evident that she felt quite independent, and was intending to take her own time.

At length, however, all was ready, and Cleopatra set sail. She crossed the Mediterranean Sea, and entered the mouth of the River Cydnus. Antony was at Tarsus, a city upon the Cydnus, a small distance above its mouth. When Cleopatra's fleet had entered the river, she embarked on board a most magnificent barge which she had constructed for the occasion, and had brought with her across the sea. This barge was the most magnificent and highly-ornamented vessel that had ever been built. It was adorned with carvings and decorations of the finest workmanship, and elaborately gilded. The sails were of purple, and the oars were inlaid and tipped with silver. Upon the deck of this barge Queen Cleopatra appeared, under a canopy of cloth of gold. She was dressed very magnificently in the costume in which Venus, the goddess of Beauty, was then generally represented. She was surrounded by a company of beautiful boys, who attended upon her in the form of Cupids, and fanned her with their wings, and by a group of young girls representing the Nymphs and the Graces. There was a band of musicians stationed upon the deck. This music guided the oarsmen, as they kept time to it in their rowing; and, soft as the melody was, the strains were heard far and wide over the water and along the shores, as the beautiful vessel advanced on its way. The performers were provided with flutes, lyres, viols, and all the other instruments customarily used in those times to produce music of a gentle and voluptuous kind.

In fact, the whole spectacle seemed like a vision of enchantment. Tidings of the approach of the barge spread rapidly around, and the people of the country came down in crowds to the shores of the river to gaze upon it in admiration as it glided slowly along. At the time of its arrival at Tarsus, Antony was engaged in giving a public audience at some tribunal in his palace, but every body ran to see Cleopatra and the barge, and the great triumvir was left consequently alone, or, at least, with only a few official attendants near him. Cleopatra, on arriving at the city, landed, and began to pitch her tents on the shores. Antony sent a messenger to bid her welcome, and to invite her to come and sup with him. She declined the invitation, saying that it was more proper that he should come and sup with her. She would accordingly expect him to come, she said, and her tents would be ready at the proper hour. Antony complied with her proposal, and came to her entertainment. He was received with a magnificence and splendor which amazed him. The tents and pavilions where the entertainment was made were illuminated with an immense number of lamps. These lamps were arranged in a very ingenious and beautiful manner, so as to produce an illumination of the most surprising brilliancy and beauty. The immense number and variety, too, of the meats and wines, and of the vessels of gold and silver, with which the tables were loaded, and the magnificence and splendor of the dresses worn by Cleopatra and her attendants, combined to render the whole scene one of bewildering enchantment.

[Illustration: THE ENTERTAINMENTS AT TARSUS.]

The next day, Antony invited Cleopatra to come and return his visit; but, though he made every possible effort to provide a banquet as sumptuous and as sumptuously served as hers, he failed entirely in this attempt, and acknowledged himself completely outdone. Antony was, moreover, at these interviews, perfectly fascinated with Cleopatra's charms. Her beauty, her wit, her thousand accomplishments, and, above all, the tact, and adroitness, and self-possession which she displayed in assuming at once so boldly, and carrying out so adroitly, the idea of her social superiority over him, that he yielded his heart almost immediately to her undisputed sway.

The first use which Cleopatra made of her power was to ask Antony, for her sake, to order her sister Arsinoë to be slain. Arsinoë had gone, it will be recollected, to Rome, to grace Cæsar's triumph there, and had afterward retired to Asia, where she was now living an exile. Cleopatra, either from a sentiment of past revenge, or else from some apprehensions of future danger, now desired

that her sister should die. Antony readily acceded to her request. He sent an officer in search of the unhappy princess. The officer slew her where he found her, within the precincts of a temple to which she had fled, supposing it a sanctuary which no degree of hostility, however extreme, would have dared to violate.

Cleopatra remained at Tarsus for some time, revolving in an incessant round of gayety and pleasure, and living in habits of unrestrained intimacy with Antony. She was accustomed to spend whole days and nights with him in feasting and revelry. The immense magnificence of these entertainments, especially on Cleopatra's part, were the wonder of the world. She seems to have taken special pleasure in exciting Antony's surprise by the display of her wealth and the boundless extravagance in which she indulged. At one of her banquets, Antony was expressing his astonishment at the vast number of gold cups, enriched with jewels, that were displayed on all sides. "Oh," said she, "they are nothing; if you like them, you shall have them all." So saying, she ordered her servants to carry them to Antony's house. The next day she invited Antony again, with a large number of the chief officers of his army and court. The table was spread with a new service of gold and silver vessels, more extensive and splendid than that of the preceding day; and at the close of the supper, when the company was about to depart, Cleopatra distributed all these treasures among the guests that had been present at the entertainment. At another of these feasts, she carried her ostentation and display to the astonishing extreme of taking off from one of her ear-rings a pearl of immense value and dissolving it in a cup of vinegar,[8] which she afterward made into a drink, such as was customarily used in those days, and then drank it. She was proceeding to do the same with the other pearl, when some of the company arrested the proceeding, and took the remaining pearl away.

In the mean time, while Antony was thus wasting his time in luxury and pleasure with Cleopatra, his public duties were neglected, and every thing was getting into confusion. Fulvia remained in Italy. Her position and her character gave her a commanding political influence, and she exerted herself in a very energetic manner to sustain, in that quarter of the world, the interests of her husband's cause. She was surrounded with difficulties and dangers, the details of which can not, however, be here particularly described. She wrote continually to Antony, urgently entreating him to come to Rome, and displaying in her letters all those marks of agitation and distress which a wife would naturally feel under the circumstances in which she was placed. The thought that her husband had been so completely drawn away from her by the guilty arts of such a woman, and led by her to abandon his wife and his family, and leave in neglect and confusion concerns of such momentous magnitude as those which demanded his attention at home, produced an excitement in her mind bordering upon phrensy. Antony was at length so far influenced by the urgency of the case that he determined to return. He broke up his quarters at Tarsus and moved south toward Tyre, which was a great naval port and station in those days. Cleopatra went with him. They were to separate at Tyre. She was to embark there for Egypt, and he for Rome.

At least that was Antony's plan, but it was not Cleopatra's. She had determined that Antony should go with her to Alexandria. As might have been expected, when the time came for the decision, the woman gained the day. Her flatteries, her arts, her caresses, her tears, prevailed. After a brief struggle between the sentiment of love on the one hand and those of ambition and of duty combined on the other, Antony gave up the contest. Abandoning every thing else, he surrendered himself wholly to Cleopatra's control, and went with her to Alexandria. He spent the winter there, giving himself up with her to every species of sensual indulgence that the most remorseless license could tolerate, and the most unbounded wealth procure.

There seemed, in fact, to be no bounds to the extravagance and infatuation which Antony displayed during the winter in Alexandria. Cleopatra devoted herself to him incessantly, day and night, filling up every moment of time with some new form of pleasure, in order that he might have no time to think of his absent wife, or to listen to the reproaches of his conscience. Antony, on his part, surrendered himself a willing victim to these wiles, and entered with all his heart into the thousand plans of gayety and merry-making which Cleopatra devised. They had each a separate establishment in the city, which was maintained at an enormous cost, and they made a regular arrangement by which each was the guest of the other on alternate days. These visits were spent in games, sports, spectacles, feasting, drinking, and in every species of riot, irregularity, and excess.

A curious instance is afforded of the accidental manner in which intelligence in respect to the scenes and incidents of private life in those ancient days is sometimes obtained, in a circumstance which occurred at this time at Antony's court. It seems that there was a young medical student at Alexandria that winter, named Philotas, who happened, in some way or other, to have formed an acquaintance with one of Antony's domestics, a cook. Under the guidance of this cook, Philotas went one day into the palace to see what was to be seen. The cook took his friend into the kitchens, where, to Philotas's great surprise, he saw, among an infinite number and variety of other preparations, eight wild boars roasting before the fires, some being more and some less advanced in the process. Philotas asked what great company was to dine there that day. The cook smiled at this question, and replied that there was to be no company at all, other than Antony's ordinary party. "But," said the cook, in explanation, "we are obliged always to prepare several suppers, and to have them ready in succession at different hours, for no one can tell at what time they will order the

entertainment to be served. Sometimes, when the supper has been actually carried in, Antony and Cleopatra will get engaged in some new turn of their diversions, and conclude not to sit down just then to the table, and so we have to take the supper away, and presently bring in another."

Antony had a son with him at Alexandria at this time, the child of his wife Fulvia. The name of the son, as well as that of the father, was Antony. He was old enough to feel some sense of shame at his father's dereliction from duty, and to manifest some respectful regard for the rights and the honor of his mother. Instead of this, however, he imitated his father's example, and, in his own way, was as reckless and as extravagant as he. The same Philotas who is above referred to was, after a time, appointed to some office or other in the young Antony's household, so that he was accustomed to sit at his table and share in his convivial enjoyments. He relates that once, while they were feasting together, there was a guest present, a physician, who was a very vain and conceited man, and so talkative that no one else had any opportunity to speak. All the pleasure of conversation was spoiled by his excessive garrulity. Philotas, however, at length puzzled him so completely with a question of logic--of a kind similar to those often discussed with great interest in ancient days--as to silence him for a time; and young Antony was so much delighted with this feat, that he gave Philotas all the gold and silver plate that there was upon the table, and sent all the articles home to him, after the entertainment was over, telling him to put his mark and stamp upon them, and lock them up.

The question with which Philotas puzzled the self-conceited physician was this. It must be premised, however, that in those days it was considered that cold water in an intermittent fever was extremely dangerous, except in some peculiar cases, and in those the effect was good. Philotas then argued as follows: "In cases of a certain kind it is best to give water to a patient in an ague. All cases of ague are cases of a certain kind. Therefore it is best in all cases to give the patient water." Philotas having propounded his argument in this way, challenged the physician to point out the fallacy of it; and while the physician sat perplexed and puzzled in his attempts to unravel the intricacy of it, the company enjoyed a temporary respite from his excessive loquacity.

Philotas adds, in his account of this affair, that he sent the gold and silver plate back to young Antony again, being afraid to keep them. Antony said that perhaps it was as well that this should be done, since many of the vessels were of great value on account of their rare and antique workmanship, and his father might possibly miss them and wish to know what had become of them.

As there were no limits, on the one hand, to the loftiness and grandeur of the pleasures to which Antony and Cleopatra addicted themselves, so there were none to the low and debasing tendencies which characterized them on the other. Sometimes, at midnight, after having been spending many hours in mirth and revelry in the palace, Antony would disguise himself in the dress of a slave, and sally forth into the streets, excited with wine, in search of adventures. In many cases, Cleopatra herself, similarly disguised, would go out with him. On these excursions Antony would take pleasure in involving himself in all sorts of difficulties and dangers--in street riots, drunken brawls, and desperate quarrels with the populace--all for Cleopatra's amusement and his own. Stories of these adventures would circulate afterward among the people, some of whom would admire the free and jovial character of their eccentric visitor, and others would despise him as a prince degrading himself to the level of a brute.

Some of the amusements and pleasures which Antony and Cleopatra pursued were innocent in themselves, though wholly unworthy to be made the serious business of life by personages on whom such exalted duties rightfully devolved. They made various excursions upon the Nile, and arranged parties of pleasure to go out on the water in the harbor, and to various rural retreats in the environs of the city. Once they went out on a fishing-party, in boats, in the port. Antony was unsuccessful; and feeling chagrined that Cleopatra should witness his ill luck, he made a secret arrangement with some of the fishermen to dive down, where they could do so unobserved, and fasten fishes to his hook under the water. By this plan he caught very large and fine fish very fast. Cleopatra, however, was too wary to be easily deceived by such a stratagem as this. She observed the maneuver, but pretended not to observe it; she expressed, on the other hand, the greatest surprise and delight at Antony's good luck, and the extraordinary skill which it indicated.

The next day she wished to go a fishing again, and a party was accordingly made as on the day before. She had, however, secretly instructed another fisherman to procure a dried and salted fish from the market, and, watching his opportunity, to get down into the water under the boats and attach it to the hook, before Antony's divers could get there. This plan succeeded, and Antony, in the midst of a large and gay party that were looking on, pulled out an excellent fish, cured and dried, such as was known to every one as an imported article, bought in the market. It was a fish of a kind that was brought originally from Asia Minor. The boats, and the water all around them, resounded with the shouts of merriment and laughter which this incident occasioned.

* * * * *

In the mean time, while Antony was thus spending his time in low and ignoble pursuits and in guilty pleasures at Alexandria, his wife Fulvia, after exhausting all other means of inducing her husband to return to her, became desperate, and took measures for fomenting an open war, which she thought would compel him to return. The extraordinary energy, influence, and talent which Fulvia possessed, enabled her to do this in an effectual manner. She organized an army, formed a camp, placed herself at the head of the troops, and sent such tidings to Antony of the dangers which threatened his cause as greatly alarmed him. At the same time news came of great disasters in Asia Minor, and of alarming insurrections among the provinces which had been committed to his charge there. Antony saw that he must arouse himself from the spell which had enchanted him and break away from Cleopatra, or that he would be wholly and irretrievably ruined. He made, accordingly, a desperate effort to get free. He bade the queen farewell, embarked hastily in a fleet of galleys, and sailed away to Tyre, leaving Cleopatra in her palace, vexed, disappointed, and chagrined.

CHAPTER XI.

THE BATTLE OF ACTIUM.

Cleopatra, in parting with Antony as described in the last chapter, lost him for two or three years. During this time Antony himself was involved in a great variety of difficulties and dangers, and passed through many eventful scenes, which, however, can not here be described in detail. His life, during this period, was full of vicissitude and excitement, and was spent probably in alternations of remorse for the past and anxiety for the future. On landing at Tyre, he was at first extremely perplexed whether to go to Asia Minor or to Rome. His presence was imperiously demanded in both places. The war which Fulvia had fomented was caused, in part, by the rivalry of Octavius, and the collision of his interests with those of her husband. Antony was very angry with her for having managed his affairs in such a way as to bring about a war. After a time Antony and Fulvia met at Athens. Fulvia had retreated to that city, and was very seriously sick there, either from bodily disease, or from the influence of long-continued anxiety, vexation, and distress. They had a stormy meeting. Neither party was disposed to exercise any mercy toward the other. Antony left his wife rudely and roughly, after loading her with reproaches. A short time afterward, she sank down in sorrow to the grave.

The death of Fulvia was an event which proved to be of advantage to Antony. It opened the way to a reconciliation between him and Octavius. Fulvia had been extremely active in opposing Octavius's designs, and in organizing plans for resisting him. He felt, therefore, a special hostility against her, and, through her, against Antony. Now, however, that she was dead, the way seemed to be in some sense opened for a reconciliation.

Octavius had a sister, Octavia, who had been the wife of a Roman general named Marcellus. She was a very beautiful and a very accomplished woman, and of a spirit very different from that of Fulvia. She was gentle, affectionate, and kind, a lover of peace and harmony, and not at all disposed, like Fulvia, to assert and maintain her influence over others by an overbearing and violent demeanor. Octavia's husband died about this time, and, in the course of the movements and negotiations between Antony and Octavius, the plan was proposed of a marriage between Antony and Octavia, which, it was thought, would ratify and confirm the reconciliation. This proposal was finally agreed upon. Antony was glad to find so easy a mode of settling his difficulties. The people of Rome, too, and the authorities there, knowing that the peace of the world depended upon the terms on which these two men stood with regard to each other, were extremely desirous that this arrangement should be carried into effect. There was a law of the commonwealth forbidding the marriage of a widow within a specified period after the death of her husband. That period had not, in Octavia's case, yet expired. There was, however, so strong a desire that no obstacle should be allowed to prevent this proposed union, or even to occasion delay, that the law was altered expressly for this case, and Antony and Octavia were married. The empire was divided between Octavius and Antony, Octavius receiving the western portion as his share, while the eastern was assigned to Antony.

It is not probable that Antony felt any very strong affection for his new wife, beautiful and gentle as she was. A man, in fact, who had led such a life as his had been, must have become by this time incapable of any strong and pure attachment. He, however, was pleased with the novelty of his acquisition, and seemed to forget for a time the loss of Cleopatra. He remained with Octavia a year. After that he went away on certain military enterprises which kept him some time from her. He returned again, and again he went away. All this time Octavia's influence over him and over her brother was of the most salutary and excellent character. She soothed their animosities, quieted their suspicions and jealousies, and at one time, when they were on the brink of open war, she effected a reconciliation between them by the most courageous and energetic, and at the same time, gentle and unassuming efforts. At the time of this danger she was with her husband in Greece; but she persuaded him to send her to her brother at Rome,

saying that she was confident that she could arrange a settlement of the difficulties impending. Antony allowed her to go. She proceeded to Rome, and procured an interview with her brother in the presence of his two principal officers of state. Here she pleaded her husband's cause with tears in her eyes; she defended his conduct, explained what seemed to be against him, and entreated her brother not to take such a course as should cast her down from being the happiest of women to being the most miserable. "Consider the circumstances of my case," said she. "The eyes of the world are upon me. Of the two most powerful men in the world, I am the wife of one and the sister of another. If you allow rash counsels to go on and war to ensue, I am hopelessly ruined; for, whichever is conquered, my husband or my brother, my own happiness will be for ever gone."

Octavius sincerely loved his sister, and he was so far softened by her entreaties that he consented to appoint an interview with Antony in order to see if their difficulties could be settled. This interview was accordingly held. The two generals came to a river, where, at the opposite banks, each embarked in a boat, and, being rowed out toward each other, they met in the middle of the stream. A conference ensued, at which all the questions at issue were, for a time at least, very happily arranged.

Antony, however, after a time, began to become tired of his wife, and to sigh for Cleopatra once more. He left Octavia at Rome and proceeded to the eastward, under pretense of attending to the affairs of that portion of the empire; but, instead of doing this, he went to Alexandria, and there renewed again his former intimacy with the Egyptian queen.

Octavius was very indignant at this. His former hostility to Antony, which had been in a measure appeased by the kind influence of Octavia, now broke forth anew, and was heightened by the feeling of resentment naturally awakened by his sister's wrongs. Public sentiment in Rome, too, was setting very strongly against Antony. Lampoons were written against him to ridicule him and Cleopatra, and the most decided censures were passed upon his conduct. Octavia was universally beloved, and the sympathy which was every where felt for her increased and heightened very much the popular indignation which was felt against the man who could wrong so deeply such sweetness, and gentleness, and affectionate fidelity as hers.

After remaining for some time in Alexandria, and renewing his connection and intimacy with Cleopatra, Antony went away again, crossing the sea into Asia, with the intention of prosecuting certain military undertakings there which imperiously demanded his attention. His plan was to return as soon as possible to Egypt after the object of his expedition should be accomplished. He found, however, that he could not bear even a temporary absence from Cleopatra. His mind dwelled so much upon her, and upon the pleasures which he had enjoyed with her in Egypt, and he longed so much to see her again, that he was wholly unfit for the discharge of his duties in the camp. He became timid, inefficient, and remiss, and almost every thing that he undertook ended disastrously. The army, who understood perfectly well the reason of their commander's remissness and consequent ill fortune, were extremely indignant at his conduct, and the camp was filled with suppressed murmurs and complaints. Antony, however, like other persons in his situation, was blind to all these indications of dissatisfaction; probably he would have disregarded them if he had observed them. At length, finding that he could bear his absence from his mistress no longer, he set out to march across the country, in the depth of the winter, to the sea-shore, to a point where he had sent for Cleopatra to come to join him. The army endured incredible hardships and exposures in this march. When Antony had once commenced the journey, he was so impatient to get forward that he compelled his troops to advance with a rapidity greater than their strength would bear. They were, besides, not provided with proper tents or with proper supplies of provision. They were often obliged, therefore, after a long and fatiguing march during the day, to bivouac at night in the open air among the mountains, with scanty means of appeasing their hunger, and very little shelter from the cold rain, or from the storms of driving snow. Eight thousand men died on this march, from cold, fatigue, and exposure; a greater sacrifice, perhaps, than had ever been made before to the mere ardor and impatience of a lover.

When Antony reached the shore, he advanced to a certain sea-port, near Sidon, where Cleopatra was to land. At the time of his arrival but a small part of his army was left, and the few men that survived were in a miserably destitute condition. Antony's eagerness to see Cleopatra became more and more excited as the time drew nigh. She did not come so soon as he had expected, and during the delay he seemed to pine away under the influence of love and sorrow. He was silent, absent-minded, and sad. He had no thoughts for any thing but the coming of Cleopatra, and felt no interest in any other plans. He watched for her incessantly, and would sometimes leave his place at the table, in the midst of the supper, and go down alone to the shore, where he would stand gazing out upon the sea, and saying mournfully to himself, "Why does not she come?" The animosity and the ridicule which these things awakened against him, on the part of the army, were extreme; but he was so utterly infatuated that he disregarded all the manifestations of public sentiment around him, and continued to allow his mind to be wholly engrossed with the single idea of Cleopatra's coming.

She arrived at last. She brought a great supply of clothes and other necessaries for the use of Antony's army, so that her coming not only gratified his love, but afforded him, also, a very essential relief, in respect to the military difficulties in which he was involved.

After some time spent in the enjoyment of the pleasure which being thus reunited to Cleopatra afforded him, Antony began again to think of the affairs of his government, which every month more and more imperiously demanded his attention. He began to receive urgent calls from various quarters, urging him to action. In the mean time, Octavia--who had been all this while waiting in distress and anxiety at Rome, hearing continually the most gloomy accounts of her husband's affairs, and the most humiliating tidings in respect to his infatuated devotion to Cleopatra--resolved to make one more effort to save him. She interceded with her brother to allow her to raise troops and to collect supplies, and then proceed to the eastward to re-enforce him. Octavius consented to this. He, in fact, assisted Octavia in making her preparations. It is said, however, that he was influenced in this plan by his confident belief that this noble attempt of his sister to reclaim her husband would fail, and that, by the failure of it, Antony would be put in the wrong, in the estimation of the Roman people, more absolutely and hopelessly than ever, and that the way would thus be prepared for his complete and final destruction.

Octavia was rejoiced to obtain her brother's aid to her undertaking, whatever the motive might be which induced him to afford it. She accordingly levied a considerable body of troops, raised a large sum of money, provided clothes, and tents, and military stores for the army; and when all was ready, she left Italy and put to sea, having previously dispatched a messenger to her husband to inform him that she was coming.

Cleopatra began now to be afraid that she was to lose Antony again, and she at once began to resort to the usual artifices employed in such cases, in order to retain her power over him. She said nothing, but assumed the appearance of one pining under the influence of some secret suffering or sorrow. She contrived to be often surprised in tears. In such cases she would hastily brush her tears away, and assume a countenance of smiles and good humor, as if making every effort to be happy, though really oppressed with a heavy burden of anxiety and grief. When Antony was near her she would seem overjoyed at his presence, and gaze upon him with an expression of the most devoted fondness. When absent from him, she spent her time alone, always silent and dejected, and often in tears; and she took care that the secret sorrows and sufferings that she endured should be duly made known to Antony, and that he should understand that they were all occasioned by her love for him, and by the danger which she apprehended that he was about to leave her.

The friends and secret agents of Cleopatra, who reported these things to Antony, made, moreover, direct representations to him, for the purpose of inclining his mind in her favor. They had, in fact, the astonishing audacity to argue that Cleopatra's claims upon Antony for a continuance of his love were paramount to those of Octavia. She, that is, Octavia, had been his wife, they said, only for a very short time. Cleopatra had been most devotedly attached to him for many years. Octavia was married to him, they alleged, not under the impulse of love, but from political considerations alone, to please her brother, and to ratify and confirm a political league made with him. Cleopatra, on the other hand, had given herself up to him in the most absolute and unconditional manner, under the influence solely of a personal affection which she could not control. She had surrendered and sacrificed every thing to him. For him she had lost her good name, alienated the affections of her subjects, made herself the object of reproach and censure to all mankind, and now she had left her native land to come and join him in his adverse fortunes. Considering how much she had done, and suffered, and sacrificed for his sake, it would be extreme and unjustifiable cruelty in him to forsake her now. She never would survive such an abandonment. Her whole soul was so wrapped up in him, that she would pine away and die if he were now to forsake her.

Antony was distressed and agitated beyond measure by the entanglements in which he found that he was involved. His duty, his inclination perhaps, certainly his ambition, and every dictate of prudence and policy, required that he should break away from these snares at once and go to meet Octavia. But the spell that bound him was too mighty to be dissolved. He yielded to Cleopatra's sorrows and tears. He dispatched a messenger to Octavia, who had by this time reached Athens, in Greece, directing her not to come any farther. Octavia, who seemed incapable of resentment or anger against her husband, sent back to ask what she should do with the troops, and money, and the military stores which she was bringing. Antony directed her to leave them in Greece. Octavia did so, and mournfully returned to her home.

As soon as she arrived at Rome, Octavius, her brother, whose indignation was now thoroughly aroused at the baseness of Antony, sent to his sister to say that she must leave Antony's house and come to him. A proper self-respect, he said, forbade her remaining any longer under the roof of such a man. Octavia replied that she would not leave her husband's house. That house was her post of

duty, whatever her husband might do, and there she would remain. She accordingly retired within the precincts of her old home, and devoted herself in patient and uncomplaining sorrow to the care of the family and the children. Among these children was one young son of Antony's, born during his marriage with her predecessor Fulvia. In the mean time, while Octavia was thus faithfully though mournfully fulfilling her duties as wife and mother, in her husband's house at Rome, Antony himself had gone with Cleopatra to Alexandria, and was abandoning himself once more to a life of guilty pleasure there. The greatness of mind which this beautiful and devoted wife thus displayed, attracted the admiration of all mankind. It produced, however, one other effect, which Octavia must have greatly deprecated. It aroused a strong and universal feeling of indignation against the unworthy object toward whom this extraordinary magnanimity was displayed.

In the mean time, Antony gave himself up wholly to Cleopatra's influence and control, and managed all the affairs of the Roman empire in the East in the way best fitted to promote her aggrandizement and honor. He made Alexandria his capital, celebrated triumphs there, arranged ostentatious expeditions into Asia and Syria with Cleopatra and her train, gave her whole provinces as presents, and exalted her two sons, Alexander and Ptolemy, children born during the period of his first acquaintance with her, to positions of the highest rank and station, as his own acknowledged sons. The consequences of these and similar measures at Rome were fatal to Antony's character and standing. Octavius reported every thing to the Roman senate and people, and made Antony's misgovernment and his various misdemeanors the ground of the heaviest accusations against him. Antony, hearing of these things, sent his agents to Rome and made accusations against Octavius; but these counter accusations were of no avail. Public sentiment was very strong and decided against him at the capital, and Octavius began to prepare for war.

Antony perceived that he must prepare to defend himself. Cleopatra entered into the plans which he formed for this purpose with great ardor. Antony began to levy troops, and collect and equip galleys and ships of war, and to make requisitions of money and military stores from all the eastern provinces and kingdoms. Cleopatra put all the resources of Egypt at his disposal. She furnished him with immense sums of money, and with an inexhaustible supply of corn, which she procured for this purpose from her dominions in the valley of the Nile. The various divisions of the immense armament which was thus provided for were ordered to rendezvous at Ephesus, where Antony and Cleopatra were awaiting to receive them, having proceeded there when their arrangements in Egypt were completed, and they were ready to commence the campaign.

When all was ready for the expedition to set sail from Ephesus, it was Antony's judgment that it would be best for Cleopatra to return to Egypt, and leave him to go forth with the fleet to meet Octavius alone. Cleopatra was, however, determined not to go away. She did not dare to leave Antony at all to himself, for fear that in some way or other a peace would be effected between himself and Octavius, which would result in his returning to Octavia and abandoning _her_. She accordingly contrived to persuade Antony to retain her with him, by bribing his chief counselor to advise him to do so. His counselor's name was Canidius. Canidius, having received Cleopatra's money, while yet he pretended to be wholly disinterested in his advice, represented to Antony that it would not be reasonable to send Cleopatra away, and deprive her of all participation in the glory of the war, when she was defraying so large a part of the expense of it. Besides, a large portion of the army consisted of Egyptian troops, who would feel discouraged and disheartened if Cleopatra were to leave them, and would probably act far less efficiently in the conflict than they would do if animated by the presence of their queen. Then, moreover, such a woman as Cleopatra was not to be considered, as many women would be, an embarrassment and a source of care to a military expedition which she might join, but a very efficient counselor and aid to it. She was, he said, a very sagacious, energetic, and powerful queen, accustomed to the command of armies and to the management of affairs of state, and her aid in the conduct of the expedition might be expected to conduce very materially to its success.

Antony was easily won by such persuasions as these, and it was at length decided that Cleopatra should accompany him.

Antony then ordered the fleet to move forward to the island of Samos.[9] Here it was brought to anchor and remained for some time, waiting for the coming in of new re-enforcements, and for the completion of the other arrangements. Antony, as if becoming more and more infatuated as he approached the brink of his ruin, spent his time while the expedition remained at Samos, not in maturing his plans and perfecting his arrangements for the tremendous conflict which was approaching, but in festivities, games, revelings, and every species of riot and dissolute excess. This, however, is not surprising. Men almost always, when in a situation analogous to his, fly to similar means of protecting themselves, in some small degree, from the pangs of remorse, and from the forebodings which stand ready to terrify and torment them at every instant in which these gloomy specters are not driven away by intoxication and revelry. At least Antony found it so. Accordingly, an immense company of players, tumblers, fools, jesters, and mountebanks were ordered to assemble at Samos, and to devote themselves with all zeal to the amusement of Antony's court. The island was one universal scene of riot and revelry. People were astonished at such celebrations and displays, wholly unsuitable, as

they considered them, to the occasion. If such are the rejoicings, said they, which Antony celebrates before going into the battle, what festivities will he contrive on his return, joyous enough to express his pleasure if he shall gain the victory?

After a time, Antony and Cleopatra, with a magnificent train of attendants, left Samos, and, passing across the Ægean Sea, landed in Greece, and advanced to Athens; while the fleet, proceeding westward from Samos, passed around Tænarus, the southern promontory of Greece, and then moved northward along the western coast of the peninsula. Cleopatra wished to go to Athens for a special reason. It was there that Octavia had stopped on her journey toward her husband with re-enforcements and aid; and while she was there, the people of Athens, pitying her sad condition, and admiring the noble spirit of mind which she displayed in her misfortunes, had paid her great attention, and during her stay among them had bestowed upon her many honors. Cleopatra now wished to go to the same place, and to triumph over her rival there, by making so great a display of her wealth and magnificence, and of her ascendency over the mind of Antony, as should entirely transcend and outshine the more unassuming pretensions of Octavia. She was not willing, it seems, to leave to the unhappy wife whom she had so cruelly wronged even the possession of a place in the hearts of the people of this foreign city, but must go and enviously strive to efface the impression which injured innocence had made, by an ostentatious exhibition of the triumphant prosperity of her own shameless wickedness. She succeeded well in her plans. The people of Athens were amazed and bewildered at the immense magnificence that Cleopatra exhibited before them. She distributed vast sums of money among the people. The city, in return, decreed to her the most exalted honors. They sent a solemn embassy to her to present her with these decrees. Antony himself, in the character of a citizen of Athens, was one of the embassadors. Cleopatra received the deputation at her palace. The reception was attended with the most splendid and imposing ceremonies.

One would have supposed that Cleopatra's cruel and unnatural hostility to Octavia might now have been satisfied; but it was not. Antony, while he was at Athens, and doubtless at Cleopatra's instigation, sent a messenger to Rome with a notice of divorcement to Octavia, and with an order that she should leave his house. Octavia obeyed. She went forth from her home, taking the children with her, and bitterly lamenting her cruel destiny.

In the mean time, while all these events had been transpiring in the East, Octavius had been making his preparations for the coming crisis, and was now advancing with a powerful fleet across the sea. He was armed with authority from the Roman senate and people, for he had obtained from them a decree deposing Antony from his power. The charges made against him all related to misdemeanors and offenses arising out of his connection with Cleopatra. Octavius contrived to get possession of a will which Antony had written before leaving Rome, and which he had placed there in what he supposed a very sacred place of deposit. The custodians who had it in charge replied to Octavius, when he demanded it, that they would not give it to him, but if he wished to take it they would not hinder him. Octavius then took the will, and read it to the Roman senate. It provided, among other things, that at his death, if his death should happen at Rome, his body should be sent to Alexandria to be given to Cleopatra; and it evinced in other ways a degree of subserviency and devotedness to the Egyptian queen which was considered wholly unworthy of a Roman chief magistrate. Antony was accused, too, of having plundered cities and provinces to make presents to Cleopatra; of having sent a library of two hundred thousand volumes to her from Pergamus, to replace the one which Julius Cæsar had accidentally burned; of having raised her sons, ignoble as their birth was, to high places of trust and power in the Roman government, and of having in many ways compromised the dignity of a Roman officer by his unworthy conduct in reference to her. He used, for example, when presiding at a judicial tribunal, to receive love-letters sent him from Cleopatra, and then at once turn off his attention from the proceedings going forward before him to read the letters.[10] Sometimes he did this when sitting in the chair of state, giving audience to embassadors and princes. Cleopatra probably sent these letters in at such times under the influence of a wanton disposition to show her power. At one time, as Octavius said in his arguments before the Roman senate, Antony was hearing a cause of the greatest importance, and during a time in the progress of the cause when one of the principal orators of the city was addressing him, Cleopatra came passing by, when Antony suddenly arose, and, leaving the court without any ceremony, ran out to follow her. These and a thousand similar tales exhibited Antony in so odious a light, that his friends forsook his cause, and his enemies gained a complete triumph. The decree was passed against him, and Octavius was authorized to carry it into effect; and accordingly, while Antony, with his fleet and army, was moving westward from Samos and the Ægean Sea, Octavius was coming eastward and southward down the Adriatic to meet him.

In process of time, after various maneuvers and delays, the two armaments came into the vicinity of each other at a place called Actium, which will be found upon the map on the western coast of Epirus, north of Greece. Both of the commanders had powerful fleets at sea, and both had great armies upon the land. Antony was strongest in land troops, but his fleet was inferior to that of Octavius, and he was himself inclined to remain on the land and fight the principal battle there. But Cleopatra would not consent to

this. She urged him to give Octavius battle at sea. The motive which induced her to do this has been supposed to be her wish to provide a more sure way of escape in case of an unfavorable issue to the conflict. She thought that in her galleys she could make sail at once across the sea to Alexandria in case of defeat, whereas she knew not what would become of her if beaten at the head of an army on the land. The ablest counselors and chief officers in the army urged Antony very strongly not to trust himself to the sea. To all their arguments and remonstrances, however, Antony turned a deaf ear. Cleopatra must be allowed to have her way.

On the morning of the battle, when the ships were drawn up in array, Cleopatra held the command of a division of fifty or sixty Egyptian vessels, which were all completely manned, and well equipped with masts and sails. She took good care to have every thing in perfect order for flight, in case flight should prove to be necessary. With these ships she took a station in reserve, and for a time remained there a quiet witness of the battle. The ships of Octavius advanced to the attack of those of Antony, and the men fought from deck to deck with spears, boarding-pikes, flaming darts, and every other destructive missile which the military art had then devised. Antony's ships had to contend against great disadvantages. They were not only outnumbered by those of Octavius, but were far surpassed by them in the efficiency with which they were manned and armed. Still, it was a very obstinate conflict. Cleopatra, however, did not wait to see how it was to be finally decided. As Antony's forces did not immediately gain the victory, she soon began to yield to her fears in respect to the result, and, finally, fell into a panic and resolved to fly. She ordered the oars to be manned and the sails to be hoisted, and then forcing her way through a portion of the fleet that was engaged in the contest, and throwing the vessels into confusion as she passed, she succeeded in getting to sea, and then pressed on, under full sail, down the coast to the southward. Antony, as soon as he perceived that she was going, abandoning every other thought, and impelled by his insane devotedness to her, hastily called up a galley of five banks of oars, and, leaping on board of it, ordered the oarsmen to pull with all their force after Cleopatra's flying squadron.

Cleopatra, looking back from the deck of her vessel, saw this swift galley pressing on toward her. She raised a signal at the stern of the vessel which she was in, that Antony might know for which of the fifty flying ships he was to steer. Guided by the signal, Antony came up to the vessel, and the sailors hoisted him up the side and helped him in. Cleopatra had, however, disappeared. Overcome with shame and confusion, she did not dare, it seems, to meet the look of the wretched victim of her arts whom she had now irretrievably ruined. Antony did not seek her. He did not speak a word. He went forward to the prow of the ship, and, throwing himself down there alone, pressed his head between his hands, and seemed stunned and stupefied, and utterly overwhelmed with horror and despair.

He was, however, soon aroused from his stupor by an alarm raised on board his galley that they were pursued. He rose from his seat, seized a spear, and, on ascending to the quarter-deck, saw that there were a number of small light boats, full of men and of arms, coming up behind them, and gaining rapidly upon his galley. Antony, now free for a moment from his enchantress's sway, and acting under the impulse of his own indomitable boldness and decision, instead of urging the oarsmen to press forward more rapidly in order to make good their escape, ordered the helm to be put about, and thus, turning the galley around, he faced his pursuers, and drove his ship into the midst of them. A violent conflict ensued, the din and confusion of which was increased by the shocks and collisions between the boats and the galley. In the end, the boats were beaten off, all excepting one: that one kept still hovering near, and the commander of it, who stood upon the deck, poising his spear with an aim at Antony, and seeking eagerly an opportunity to throw it, seemed by his attitude and the expression of his countenance to be animated by some peculiarly bitter feeling of hostility and hate. Antony asked him who he was, that dared so fiercely to threaten _him_. The man replied by giving his name, and saying that he came to avenge the death of his father. It proved that he was the son of a man whom Antony had at a previous time, on some account or other, caused to be beheaded.

There followed an obstinate contest between Antony and this fierce assailant, in the end of which the latter was beaten off. The boats then, having succeeded in making some prizes from Antony's fleet, though they had failed in capturing Antony himself, gave up the pursuit and returned. Antony then went back to his place, sat down in the prow, buried his face in his hands, and sank into the same condition of hopeless distress and anguish as before.

When husband and wife are overwhelmed with misfortune and suffering, each instinctively seeks a refuge in the sympathy and support of the other. It is, however, far otherwise with such connections as that of Antony and Cleopatra. Conscience, which remains calm and quiet in prosperity and sunshine, rises up with sudden and unexpected violence as soon as the hour of calamity comes; and thus, instead of mutual comfort and help, each finds in the thoughts of the other only the means of adding the horrors of remorse to the anguish of disappointment and despair. So extreme was Antony's distress, that for three days he and Cleopatra neither saw nor spoke to each other. She was overwhelmed with confusion and chagrin, and he was in such a condition of mental excitement that she did not dare to approach him. In a word, reason seemed to have wholly lost its sway--his mind, in the

alternations of his insanity, rising sometimes to fearful excitement, in paroxysms of uncontrollable rage, and then sinking again for a time into the stupor of despair.

In the mean time, the ships were passing down as rapidly as possible on the western coast of Greece. When they reached Tænarus, the southern promontory of the peninsula, it was necessary to pause and consider what was to be done. Cleopatra's women went to Antony and attempted to quiet and calm him. They brought him food. They persuaded him to see Cleopatra. A great number of merchant ships from the ports along the coast gathered around Antony's little fleet and offered their services. His cause, they said, was by no means desperate. The army on the land had not been beaten. It was not even certain that his fleet had been conquered. They endeavored thus to revive the ruined commander's sinking courage, and to urge him to make a new effort to retrieve his fortunes. But all was in vain. Antony was sunk in a hopeless despondency. Cleopatra was determined on going to Egypt, and he must go too. He distributed what treasure remained at his disposal among his immediate followers and friends, and gave them advice about the means of concealing themselves until they could make peace with Octavius. Then, giving up all as lost, he followed Cleopatra across the sea to Alexandria.

CHAPTER XII.

THE END OF CLEOPATRA.

The case of Mark Antony affords one of the most extraordinary examples of the power of unlawful love to lead its deluded and infatuated victim into the very jaws of open and recognized destruction that history records. Cases similar in character occur by thousands in common life; but Antony's, though perhaps not more striking in itself than a great multitude of others have been, is the most conspicuous instance that has ever been held up to the observation of mankind.

In early life, Antony was remarkable, as we have already seen, for a certain savage ruggedness of character, and for a stern and indomitable recklessness of will, so great that it seemed impossible that any thing human should be able to tame him. He was under the control, too, of an ambition so lofty and aspiring that it appeared to know no bounds; and yet we find him taken possession of, in the very midst of his career, and in the height of his prosperity and success, by a woman, and so subdued by her arts and fascinations as to yield himself wholly to her guidance, and allow himself to be led about by her entirely at her will. She displaces whatever there might have been that was noble and generous in his heart, and substitutes therefor her own principles of malice and cruelty. She extinguishes all the fires of his ambition, originally so magnificent in its aims that the world seemed hardly large enough to afford it scope, and instead of this lofty passion, fills his soul with a love of the lowest, vilest, and most ignoble pleasures. She leads him to betray every public trust, to alienate from himself all the affections of his countrymen, to repel most cruelly the kindness and devotedness of a beautiful and faithful wife, and, finally, to expel this wife and all of his own legitimate family from his house; and now, at last, she conducts him away in a most cowardly and ignoble flight from the field of his duty as a soldier--he knowing, all the time, that she is hurrying him to disgrace and destruction, and yet utterly without power to break from the control of his invisible chains.

* * * * *

The indignation which Antony's base abandonment of his fleet and army at the battle of Actium excited, over all that part of the empire which had been under his command, was extreme. There was not the slightest possible excuse for such a flight. His army, in which his greatest strength lay, remained unharmed, and even his fleet was not defeated. The ships continued the combat until night, notwithstanding the betrayal of their cause by their commander. They were at length, however, subdued. The army, also, being discouraged, and losing all motive for resistance, yielded too. In a very short time the whole country went over to Octavius's side.

In the mean time, Cleopatra and Antony, on their first return to Egypt, were completely beside themselves with terror. Cleopatra formed a plan for having all the treasures that she could save, and a certain number of galleys sufficient for the transportation of these treasures and a small company of friends, carried across the isthmus of Suez and launched upon the Red Sea, in order that she might escape in that direction, and find some remote hiding-place and safe retreat on the shores of Arabia or India, beyond the reach of Octavius's dreaded power. She actually commenced this undertaking, and sent one or two of her galleys across the isthmus; but the Arabs seized them as soon as they reached their place of destination, and killed or captured the men that had them in charge, so that this desperate scheme was soon abandoned. She and Antony then finally concluded to establish themselves at Alexandria, and made preparation, as well as they could, for defending themselves against Octavius there.

Antony, when the first effects of his panic subsided, began to grow mad with vexation and resentment against all mankind. He determined that he would have nothing to do with Cleopatra or with any of her friends, but went off in a fit of sullen rage, and built a hermitage in a lonely place on the island of Pharos, where he lived for a time, cursing his folly and his wretched fate, and uttering the bitterest invectives against all who had been concerned in it. Here tidings came continually in, informing him of the defection of one after another of his armies, of the fall of his provinces in Greece and Asia Minor, and of the irresistible progress which Octavius was now making toward universal dominion. The tidings of these disasters coming incessantly upon him kept him in a continual fever of resentment and rage.

At last he became tired of his misanthropic solitude, a sort of reconciliation ensued between himself and Cleopatra, and he went back again to the city. Here he joined himself once more to Cleopatra, and, collecting together what remained of their joint resources, they plunged again into a life of dissipation and vice, with the vain attempt to drown in mirth and wine the bitter regrets and the anxious forebodings which filled their souls. They joined with them a company of revelers as abandoned as themselves, and strove very hard to disguise and conceal their cares in their forced and unnatural gayety. They could not, however, accomplish this purpose. Octavius was gradually advancing in his progress, and they knew very well that the time of his dreadful reckoning with them must soon come; nor was there any place on earth in which they could look with any hope of finding a refuge in it from his vindictive hostility.

Cleopatra, warned by dreadful presentiments of what would probably at last be her fate, amused herself in studying the nature of poisons--not theoretically, but practically--making experiments with them on wretched prisoners and captives whom she compelled to take them, in order that she and Antony might see the effects which they produced. She made a collection of all the poisons which she could procure, and administered portions of them all, that she might see which were sudden and which were slow in their effects, and also learn which produced the greatest distress and suffering, and which, on the other hand, only benumbed and stupefied the faculties, and thus extinguished life with the least infliction of pain. These experiments were not confined to such vegetable and mineral poisons as could be mingled with the food or administered in a potion. Cleopatra took an equal interest in the effects of the bite of venomous serpents and reptiles. She procured specimens of all these animals, and tried them upon her prisoners, causing the men to be stung and bitten by them, and then watching the effects. These investigations were made, not directly with a view to any practical use which she was to make of the knowledge thus acquired, but rather as an agreeable occupation, to divert her mind, and to amuse Antony and her guests. The variety in the forms and expressions which the agony of her poisoned victims assumed--their writhings, their cries, their convulsions, and the distortions of their features when struggling with death, furnished exactly the kind and degree of excitement which she needed to occupy and amuse her mind.

Antony was not entirely at ease, however, during the progress of these terrible experiments. His foolish and childish fondness for Cleopatra was mingled with jealousy, suspicion, and distrust; and he was so afraid that Cleopatra might secretly poison him, that he would never take any food or wine without requiring that she should taste it before him. At length, one day, Cleopatra caused the petals of some flowers to be poisoned, and then had the flowers woven into the chaplet which Antony was to wear at supper. In the midst of the feast, she pulled off the leaves of the flowers from her own chaplet and put them playfully into her wine, and then proposed that Antony should do the same with his chaplet, and that they should then drink the wine, tinctured, as it would be, with the color and the perfume of the flowers. Antony entered very readily into this proposal, and when he was about to drink the wine, she arrested his hand, and told him that it was poisoned. "You see now," said she, "how vain it is for you to watch against me. If it were possible for me to live without you, how easy it would be for me to devise ways and means to kill you." Then, to prove that her words were true, she ordered one of the servants to drink Antony's wine. He did so, and died before their sight in dreadful agony.

The experiments which Cleopatra thus made on the nature and effects of poison were not, however, wholly without practical result. Cleopatra learned from them, it is said, that the bite of the asp was the easiest and least painful mode of death. The effect of the venom of that animal appeared to her to be the lulling of the sensorium into a lethargy or stupor, which soon ended in death, without the intervention of pain. This knowledge she seems to have laid up in her mind for future use.

The thoughts of Cleopatra appear, in fact, to have been much disposed, at this time, to flow in gloomy channels, for she occupied herself a great deal in building for herself a sepulchral monument in a certain sacred portion of the city. This monument had, in fact, been commenced many years ago, in accordance with a custom prevailing among Egyptian sovereigns, of expending a portion of their revenues during their life-time in building and decorating their own tombs. Cleopatra now turned her mind with new interest to her own mausoleum. She finished it, provided it with the strongest possible bolts and bars, and, in a word, seemed to be preparing it in all respects for occupation.

In the mean time, Octavius, having made himself master of all the countries which had formerly been under Antony's sway, now advanced, meeting none to oppose him, from Asia Minor into Syria, and from Syria toward Egypt. Antony and Cleopatra made one attempt, while he was thus advancing toward Alexandria, to avert the storm which was impending over them, by sending an embassage to ask for some terms of peace. Antony proposed, in this embassage, to give up every thing to his conqueror on condition that he might be permitted to retire unmolested with Cleopatra to Athens, and allowed to spend the remainder of their days there in peace; and that the kingdom of Egypt might descend to their children. Octavius replied that he could not make any terms with Antony, though he was willing to consent to any thing that was reasonable in behalf of Cleopatra. The messenger who came back from Octavius with this reply spent some time in private interviews with Cleopatra. This aroused Antony's jealousy and anger. He accordingly ordered the unfortunate messenger to be scourged and then sent back to Octavius, all lacerated with wounds, with orders to say to Octavius that if it displeased him to have one of his servants thus punished, he might revenge himself by scourging a servant of Antony's, who was then, as it happened, in Octavius's power.

The news at length suddenly arrived at Alexandria that Octavius had appeared before Pelusium, and that the city had fallen into his hands. The next thing Antony and Cleopatra well knew would be, that they should see him at the gates of Alexandria. Neither Antony nor Cleopatra had any means of resisting his progress, and there was no place to which they could fly. Nothing was to be done but to await, in consternation and terror, the sure and inevitable doom which was now so near.

Cleopatra gathered together all her treasures and sent them to her tomb. These treasures consisted of great and valuable stores of gold, silver, precious stones, garments of the highest cost, and weapons, and vessels of exquisite workmanship and great value, the hereditary possessions of the Egyptian kings. She also sent to the mausoleum an immense quantity of flax, tow, torches, and other combustibles. These she stored in the lower apartments of the monument, with the desperate determination of burning herself and her treasures together rather than to fall into the hands of the Romans.

In the mean time, the army of Octavius steadily continued its march across the desert from Pelusium to Alexandria. On the way, Octavius learned, through the agents in communication with him from within the city, what were the arrangements which Cleopatra had made for the destruction of her treasure whenever the danger should become imminent of its falling into his hands. He was extremely unwilling that this treasure should be lost. Besides its intrinsic value, it was an object of immense importance to him to get possession of it for the purpose of carrying it to Rome as a trophy of his triumph. He accordingly sent secret messengers to Cleopatra, endeavoring to separate her from Antony, and to amuse her mind with the profession that he felt only friendship for her, and did not mean to do her any injury, being in pursuit of Antony only. These negotiations were continued from day to day while Octavius was advancing. At last the Roman army reached Alexandria, and invested it on every side.

As soon as Octavius was established in his camp under the walls of the city, Antony planned a sally, and he executed it, in fact, with considerable energy and success. He issued suddenly from the gates, at the head of as strong a force as he could command, and attacked a body of Octavius's horsemen. He succeeded in driving these horsemen away from their position, but he was soon driven back in his turn, and compelled to retreat to the city, fighting as he fled, to beat back his pursuers. He was extremely elated at the success of this skirmish. He came to Cleopatra with a countenance full of animation and pleasure, took her in his arms and kissed her, all accoutered for battle as he was, and boasted greatly of the exploit which he had performed. He praised, too, in the highest terms, the valor of one of the officers who had gone out with him to the fight, and whom he had now brought to the palace to present to Cleopatra. Cleopatra rewarded the faithful captain's prowess with a magnificent suit of armor made of gold. Notwithstanding this reward, however, the man deserted Antony that very night, and went over to the enemy. Almost all of Antony's adherents were in the same state of mind. They would have gladly gone over to the camp of Octavius, if they could have found an opportunity to do so.

In fact, when the final battle was fought, the fate of it was decided by a grand defection in the fleet, which went over in a body to the side of Octavius. Antony was planning the operations of the day, and reconnoitering the movements of the enemy from an eminence which he occupied at the head of a body of foot soldiers--all the land forces that now remained to him--and looking off from the eminence on which he stood toward the harbor, he observed a movement among the galleys. They were going out to meet the ships of Octavius, which were lying at anchor not very far from them. Antony supposed that his vessels were going to attack those of the enemy, and he looked to see what exploits they would perform. They advanced toward Octavius's ships, and when they met them, Antony observed, to his utter amazement, that, instead of the furious combat that he had expected to see, the ships only exchanged friendly salutations, by the use of the customary naval signals; and then his ships, passing quietly round, took their positions in the lines of the other fleet. The two fleets had thus become merged and mingled into one.

Antony immediately decided that this was Cleopatra's treason. She had made peace with Octavius, he thought, and surrendered the fleet to him as one of the conditions of it. Antony ran through the city, crying out that he was betrayed, and in a phrensy of rage sought the palace. Cleopatra fled to her tomb. She took in with her one or two attendants, and bolted and barred the doors, securing the fastenings with the heavy catches and springs that she had previously made ready. She then directed her women to call out through the door that she had killed herself within the tomb.

The tidings of her death were borne to Antony. It changed his anger to grief and despair. His mind, in fact, was now wholly lost to all balance and control, and it passed from the dominion of one stormy passion to another with the most capricious facility. He cried out with the most bitter expressions of sorrow, mourning, he said, not so much Cleopatra's death, for he should soon follow and join her, as the fact that she had proved herself so superior to him in courage at last, in having thus anticipated him in the work of self-destruction.

He was at this time in one of the chambers of the palace, whither he had fled in his despair, and was standing by a fire, for the morning was cold. He had a favorite servant named Eros, whom he greatly trusted, and whom he had made to take an oath long before, that whenever it should become necessary for him to die, Eros should kill him. This Eros he now called to him, and telling him that the time was come, ordered him to take the sword and strike the blow.

Eros took the sword while Antony stood up before him. Eros turned his head aside as if wishing that his eyes should not see the deed which his hands were about to perform. Instead, however, of piercing his master with it, he plunged it into his own breast, fell down at Antony's feet, and died.

Antony gazed a moment at the shocking spectacle, and then said, "I thank thee for this, noble Eros. Thou hast set me an example. I must do for myself what thou couldst not do for me." So saying, he took the sword from his servant's hands, plunged it into his body, and staggering to a little bed that was near, fell over upon it in a swoon. He had received a mortal wound.

The pressure, however, which was produced by the position in which he lay upon the bed, stanched the wound a little and stopped the flow of blood. Antony came presently to himself again, and then began to beg and implore those around him to take the sword and put him out of his misery. But no one would do it. He lay for a time suffering great pain, and moaning incessantly, until, at length, an officer came into the apartment and told him that the story which he had heard of Cleopatra's death was not true; that she was still alive, shut up in her monument, and that she desired to see him there. This intelligence was the source of new excitement and agitation. Antony implored the by-standers to carry him to Cleopatra, that he might see her once more before he died. They shrank from the attempt; but, after some hesitation and delay, they concluded to undertake to remove him. So, taking him in their arms, they bore him along, faint and dying, and marking their track with his blood, toward the tomb.

Cleopatra would not open the gates to let the party in. The city was all in uproar and confusion through the terror of the assault which Octavius was making upon it, and she did not know what treachery might be intended. She therefore went up to a window above, and letting down ropes and chains, she directed those below to fasten the dying body to them, that she and the two women with her might draw it up. This was done. Those who witnessed it said that it was a most piteous sight to behold--Cleopatra and her women above exhausting their strength in drawing the wounded and bleeding sufferer up the wall, while he, when he approached the window, feebly raised his arms to them, that they might lift him in. The women had hardly strength sufficient to draw the body up. At one time it seemed that the attempt would have to be abandoned; but Cleopatra reached down from the window as far as she could to get hold of Antony's arms, and thus, by dint of great effort, they succeeded at last in taking him in. They bore him to a couch which was in the upper room from which the window opened, and laid him down, while Cleopatra wrung her hands, and tore her hair, and uttered the most piercing lamentations and cries. She leaned over the dying Antony, crying out incessantly with the most piteous exclamations of grief. She bathed his face, which was covered with blood, and vainly endeavored to stanch his wound.

Antony urged her to be calm, and not to mourn his fate. He asked for some wine. They brought it to him, and he drank it. He then entreated Cleopatra to save her life, if she possibly could do so, and to make some terms or other with Octavius, so as to continue to live. Very soon after this he expired.

[Illustration: THE RAISING OF ANTONY TO THE UPPER WINDOW OF THE TOMB]

In the mean time, Octavius had heard of the mortal wound which Antony had given himself; for one of the by-standers had seized the sword the moment that the deed was done, and had hastened to carry it to Octavius, and to announce to him the death of his

enemy. Octavius immediately desired to get Cleopatra into his power. He sent a messenger, therefore, to the tomb, who attempted to open a parley there with her. Cleopatra talked with the messenger through the keyholes or crevices, but could not be induced to open the door. The messenger reported these facts to Octavius. Octavius then sent another man with the messenger, and while one was engaging the attention of Cleopatra and her women at the door below, the other obtained ladders, and succeeded in gaining admission into the window above. Cleopatra was warned of the success of this stratagem by the shriek of her woman, who saw the officer coming down the stairs. She looked around, and observing at a glance that she was betrayed, and that the officer was coming to seize her, she drew a little dagger from her robe, and was about to plunge it into her breast, when the officer grasped her arm just in time to prevent the blow. He took the dagger from her, and then examined her clothes to see that there were no other secret weapons concealed there.

The capture of the queen being reported to Octavius, he appointed an officer to take her into close custody. This officer was charged to treat her with all possible courtesy, but to keep a close and constant watch over her, and particularly to guard against allowing her any possible means or opportunity for self-destruction.

In the mean time, Octavius took formal possession of the city, marching in at the head of his troops with the most imposing pomp and parade. A chair of state, magnificently decorated, was set up for him on a high elevation in a public square; and here he sat, with circles of guards around him, while the people of the city, assembled before him in the dress of suppliants, and kneeling upon the pavement, begged his forgiveness, and implored him to spare the city. These petitions the great conqueror graciously condescended to grant.

Many of the princes and generals who had served under Antony came next to beg the body of their commander, that they might give it an honorable burial. These requests, however, Octavius would not accede to, saying that he could not take the body away from Cleopatra. He, however, gave Cleopatra leave to make such arrangements for the obsequies as she thought fit, and allowed her to appropriate such sums of money from her treasures for this purpose as she desired. Cleopatra accordingly made the necessary arrangements, and superintended the execution of them; not, however, with any degree of calmness and composure, but in a state, on the contrary, of extreme agitation and distress. In fact, she had been living now so long under the unlimited and unrestrained dominion of caprice and passion, that reason was pretty effectually dethroned, and all self-control was gone. She was now nearly forty years of age, and, though traces of her inexpressible beauty remained, her bloom was faded, and her countenance was wan with the effects of weeping, anxiety, and despair. She was, in a word, both in body and mind, only the wreck and ruin of what she once had been.

When the burial ceremonies were performed, and she found that all was over--that Antony was forever gone, and she herself hopelessly and irremediably ruined--she gave herself up to a perfect phrensy of grief. She beat her breast, and scratched and tore her flesh so dreadfully, in the vain efforts which she made to kill herself, in the paroxysms of her despair, that she was soon covered with contusions and wounds, which, becoming inflamed and swelled, made her a shocking spectacle to see, and threw her into a fever. She then conceived the idea of pretending to be more sick than she was, and so refusing food and starving herself to death. She attempted to execute this design. She rejected every medical remedy that was offered her, and would not eat, and lived thus some days without food. Octavius, to whom every thing relating to his captive was minutely reported by her attendants, suspected her design. He was very unwilling that she should die, having set his heart on exhibiting her to the Roman people, on his return to the capital, in his triumphal procession. He accordingly sent her orders, requiring that she should submit to the treatment prescribed by the physician, and take her food, enforcing these his commands with a certain threat which he imagined might have some influence over her. And what threat does the reader imagine could possibly be devised to reach a mind so sunk, so desperate, so wretched as hers? Every thing seemed already lost but life, and life was only an insupportable burden. What interests, then, had she still remaining upon which a threat could take hold?

Octavius, in looking for some avenue by which he could reach her, reflected that she was a mother. Cæsarion, the son of Julius Cæsar, and Alexander, Cleopatra, and Ptolemy, Antony's children, were still alive. Octavius imagined that in the secret recesses of her wrecked and ruined soul there might be some lingering principle of maternal affection remaining which he could goad into life and action. He accordingly sent word to her that, if she did not yield to the physician and take her food, he would kill every one of her children.

The threat produced its effect. The crazed and frantic patient became calm. She received her food. She submitted to the physician. Under his treatment her wounds began to heal, the fever was allayed, and at length she appeared to be gradually recovering.

When Octavius learned that Cleopatra had become composed, and seemed to be in some sense convalescent, he resolved to pay her a visit. As he entered the room where she was confined, which seems to have been still the upper chamber of her tomb, he found her lying on a low and miserable bed, in a most wretched condition, and exhibiting such a spectacle of disease and wretchedness that he was shocked at beholding her. She appeared, in fact, almost wholly bereft of reason. When Octavius came in, she suddenly leaped out of the bed, half naked as she was, and covered with bruises and wounds, and crawled miserably along to her conqueror's feet in the attitude of a suppliant. Her hair was torn from her head, her limbs were swollen and disfigured, and great bandages appeared here and there, indicating that there were still worse injuries than these concealed. From the midst of all this squalidness and misery there still beamed from her sunken eyes a great portion of their former beauty, and her voice still possessed the same inexpressible charm that had characterized it so strongly in the days of her prime. Octavius made her go back to her bed again and lie down.

Cleopatra then began to talk and excuse herself for what she had done, attributing all the blame of her conduct to Antony. Octavius, however, interrupted her, and defended Antony from her criminations, saying to her that it was not his fault so much as hers. She then suddenly changed her tone, and acknowledging her sins, piteously implored mercy. She begged Octavius to pardon and spare her, as if now she were afraid of death and dreaded it, instead of desiring it as a boon. In a word, her mind, the victim and the prey alternately of the most dissimilar and inconsistent passions, was now overcome by fear. To propitiate Octavius, she brought out a list of all her private treasures, and delivered it to him as a complete inventory of all that she had. One of her treasurers, however, named Zeleucus, who was standing by, said to Octavius that that list was not complete. Cleopatra had, he alleged, reserved several things of great value, which she had not put down upon it.

This assertion, thus suddenly exposing her duplicity, threw Cleopatra into a violent rage. She sprang from her bed and assaulted her secretary in a most furious manner. Octavius and the others who were there interposed, and compelled Cleopatra to lie down again, which she did, uttering all the time the most grievous complaints at the wretched degradation to which she was reduced, to be insulted thus by her own servants at such a time. If she had reserved any thing, she said, of her private treasures, it was only for presents to some of her faithful friends, to induce them the more zealously to intercede with Octavius in her behalf. Octavius replied by urging her to feel no concern on the subject whatever. He freely gave her, he said, all that she had reserved, and he promised in other respects to treat her in the most honorable and courteous manner.

Octavius was much pleased at the result of this interview. It was obvious, as it appeared to him, that Cleopatra had ceased to desire to die; that she now, on the contrary, wished to live, and that he should accordingly succeed in his desire of taking her with him to grace his triumph at Rome. He accordingly made his arrangements for departure, and Cleopatra was notified that in three days she was to set out, together with her children, to go into Syria. Octavius said Syria, as he did not wish to alarm Cleopatra by speaking of Rome. She, however, understood well where the journey, if once commenced, would necessarily end, and she was fully determined in her own mind that she would never go there.

She asked to be allowed to pay one parting visit to Antony's tomb. This request was granted; and she went to the tomb with a few attendants, carrying with her chaplets and garlands of flowers. At the tomb her grief broke forth anew, and was as violent as ever. She bewailed her lover's death with loud cries and lamentations, uttered while she was placing the garlands upon the tomb, and offering the oblations and incense, which were customary in those days, as expressions of grief. "These," said she, as she made the offerings, "are the last tributes of affection that I can ever pay thee, my dearest, dearest lord. I can not join thee, for I am a captive and a prisoner, and they will not let me die. They watch me every hour, and are going to bear me far away, to exhibit me to thine enemies, as a badge and trophy of their triumph over thee. Oh intercede, dearest Antony, with the gods where thou art now, since those that reign here on earth have utterly forsaken me; implore them to save me from this fate, and let me die here in my native land, and be buried by thy side in this tomb."

When Cleopatra returned to her apartment again after this melancholy ceremony, she seemed to be more composed than she had been before. She went to the bath, and then she attired herself handsomely for supper. She had ordered supper that night to be very sumptuously served. She was at liberty to make these arrangements, for the restrictions upon her movements, which had been imposed at first, were now removed, her appearance and demeanor having been for some time such as to lead Octavius to suppose that there was no longer any danger that she would attempt self-destruction. Her entertainment was arranged, therefore, according to her directions, in a manner corresponding with the customs of her court when she had been a queen. She had many attendants, and among them were two of her own women. These women were long-tried and faithful servants and friends.

While she was at supper, a man came to the door with a basket, and wished to enter. The guards asked him what he had in his basket. He opened it to let them see; and, lifting up some green leaves which were laid over the top, he showed the soldiers that the basket was filled with figs. He said that they were for Cleopatra's supper. The soldiers admired the appearance of the figs, saying that they were very fine and beautiful. The man asked the soldiers to take some of them. This they declined, but allowed the man to pass in. When the supper was ended, Cleopatra sent all of her attendants away except the two women. They remained. After a little time, one of these women came out with a letter for Octavius, which Cleopatra had written, and which she wished to have immediately delivered. One of the soldiers from the guard stationed at the gates was accordingly dispatched to carry the letter. Octavius, when it was given to him, opened the envelope at once and read the letter, which was written, as was customary in those days, on a small tablet of metal. He found that it was a brief but urgent petition from Cleopatra, written evidently in agitation and excitement, praying that he would overlook her offense, and allow her to be buried with Antony. Octavius immediately inferred that she had destroyed herself. He sent off some messengers at once, with orders to go directly to her place of confinement and ascertain the truth, intending to follow them himself immediately.

The messengers, on their arrival at the gates, found the sentinels and soldiers quietly on guard before the door, as if all were well. On entering Cleopatra's room, however, they beheld a shocking spectacle. Cleopatra was lying dead upon a couch. One of her women was upon the floor, dead too. The other, whose name was Charmion, was sitting over the body of her mistress, fondly caressing her, arranging flowers in her hair, and adorning her diadem. The messengers of Octavius, on witnessing this spectacle, were overcome with amazement, and demanded of Charmion what it could mean. "It is all right," said Charmion. "Cleopatra has acted in a manner worthy of a princess descended from so noble a line of kings." As Charmion said this, she began to sink herself, fainting, upon the bed, and almost immediately expired.

The by-standers were not only shocked at the spectacle which was thus presented before them, but they were perplexed and confounded in their attempts to discover by what means Cleopatra and her women had succeeded in effecting their design. They examined the bodies, but no marks of violence were to be discovered. They looked all around the room, but no weapons, and no indication of any means of poison, were to be found. They discovered something that appeared like the slimy track of an animal on the wall, toward a window, which they thought might have been produced by an _asp_; but the animal itself was nowhere to be seen. They examined the body with great care, but no marks of any bite or sting were to be found, except that there were two very slight and scarcely-discernible punctures on the arm, which some persons fancied might have been so caused. The means and manner of her death seemed to be involved in impenetrable mystery.

There were various rumors on the subject subsequently in circulation both at Alexandria and at Rome, though the mystery was never fully solved. Some said that there was an asp concealed among the figs which the servant man brought in in the basket; that he brought it in that manner, by a preconcerted arrangement between him and Cleopatra, and that, when she received it, she placed the animal on her arm. Others say that she had a small steel instrument like a needle, with a poisoned point, which she had kept concealed in her hair, and that she killed herself with that, without producing any visible wound. Another story was, that she had an asp in a box somewhere in her apartment, which she had reserved for this occasion, and when the time finally came, that she pricked and teased it with a golden bodkin to make it angry, and then placed it upon her flesh and received its sting. Which of these stories, if either of them, were true, could never be known. It has, however, been generally believed among mankind that Cleopatra died in some way or other by the self-inflicted sting of the asp, and paintings and sculptures without number have been made to illustrate and commemorate the scene.

This supposition in respect to the mode of her death is, in fact, confirmed by the action of Octavius himself on his return to Rome, which furnishes a strong indication of his opinion of the manner in which his captive at last eluded him. Disappointed in not being able to exhibit the queen herself in his triumphal train, he caused a golden statue representing her to be made, with an image of an asp upon the arm of it, and this sculpture he caused to be borne conspicuously before him in his grand triumphal entry into the capital, as the token and trophy of the final downfall of the unhappy Egyptian queen.

THE END.

FOOTNOTES:

[1] See Map of the Delta of the Nile, page 29; also the View of Alexandria, page 162.

[2] See map; frontispiece.

[3] It will be sufficiently accurate for the general reader of history to consider the Greek talent, referred to in such transactions as these, as equal in English money to two hundred and fifty pounds, in American to a thousand dollars. It is curious to observe that, large as the total was that was paid for the liberation of these slaves, the amount paid for each individual was, after all, only a sum equal to about five dollars.

[4] For an account of one of these disasters, with an engraving illustrative of the scene, see the HISTORY OF CYRUS.

[5] For the position of this island in respect to Egypt and the neighboring countries, see map, frontispiece.

[6] This Octavius, on his subsequent elevation to imperial power, received the name of Augustus Cæsar, and it is by this name that he is generally known in history. He was, however, called Octavius at the commencement of his career, and, to avoid confusion, we shall continue to designate him by this name to the end of our narrative.

[7] See map, at the frontispiece.

[8] Pearls, being of the nature of _shell_ in their composition and structure, are soluble in certain acids.

[9] See map for the situation of Ephesus and of Samos.

[10] These letters, in accordance with the scale of expense and extravagance on which Cleopatra determined that every thing relating to herself and Antony should be done, were engraved on tablets made of onyx, or crystal, or other hard and precious stones.

IN PROFOUND REVERENCE THIS WORK IS DEDICATED BY THE EDITOR TO THE MEMORY OF

Alexander Wheelock Thayer and Dr. Hermann Deiters

ALSO IN GRATEFUL APPRECIATION TO THE BEETHOVEN ASSOCIATION

AND WITH A LARGE MEASURE OF GRATITUDE AND AFFECTION TO HIS FRIEND AND COLLEAGUE RICHARD ALDRICH

Introduction

If for no other reasons than because of the long time and monumental patience expended upon its preparation, the vicissitudes through which it has passed and the varied and arduous labors bestowed upon it by the author and his editors, the history of Alexander Wheelock Thayer's Life of Beethoven deserves to be set forth as an introduction to this work. His work it is, and his monument, though others have labored long and painstakingly upon it. There has been no considerable time since the middle of the last century when it has not occupied the minds of the author and those who have been associated with him in its creation. Between the conception of its plan and its execution there lies a period of more than two generations. Four men have labored zealously and affectionately upon its pages, and the fruits of more than four score men, stimulated to investigation by the first revelations made by the author, have been conserved in the ultimate form of the biography. It was seventeen years after Mr.

Thayer entered upon what proved to be his life-task before he gave the first volume to the world--and then in a foreign tongue; it was thirteen more before the third volume came from the press. This volume, moreover, left the work unfinished, and thirty-two years more had to elapse before it was completed. When this was done the patient and self-sacrificing investigator was dead; he did not live to finish it himself nor to see it finished by his faithful collaborator of many years, Dr. Deiters; neither did he live to look upon a single printed page in the language in which he had written that portion of the work published in his lifetime. It was left for another hand to prepare the English edition of an American writer's history of Germany's greatest tone-poet, and to write its concluding chapters, as he believes, in the spirit of the original author.

Under these circumstances there can be no vainglory in asserting that the appearance of this edition of Thayer's Life of Beethoven deserves to be set down as a significant occurrence in musical history. In it is told for the first time in the language of the great biographer the true story of the man Beethoven--his history stripped of the silly sentimental romance with which early writers and their later imitators and copyists invested it so thickly that the real humanity, the humanliness, of the composer has never been presented to the world. In this biography there appears the veritable Beethoven set down in his true environment of men and things--the man as he actually was, the man as he himself, like Cromwell, asked to be shown for the information of posterity. It is doubtful if any other great man's history has been so encrusted with fiction as Beethoven's. Except Thayer's, no biography of him has been written which presents him in his true light. The majority of the books which have been written of late years repeat many of the errors and falsehoods made current in the first books which were written about him. A great many of these errors and falsehoods are in the account of the composer's last sickness and death, and were either inventions or exaggerations designed by their utterers to add pathos to a narrative which in unadorned truth is a hundredfold more pathetic than any tale of fiction could possibly be. Other errors have concealed the truth in the story of Beethoven's guardianship of his nephew, his relations with his brothers, the origin and nature of his fatal illness, his dealings with his publishers and patrons, the generous attempt of the Philharmonic Society of London to extend help to him when upon his deathbed.

In many details the story of Beethoven's life as told here will be new to English and American readers; in a few cases the details will be new to the world, for the English edition of Thayer's biography is not a translation of the German work but a presentation of the original manuscript, so far as the discoveries made after the writing did not mar its integrity, supplemented by the knowledge acquired since the publication of the first German edition, and placed at the service of the present editor by the German revisers of the second edition. The editor of this English edition was not only in communication with Mr. Thayer during the last ten years of his life, but was also associated to some extent with his continuator and translator, Dr. Deiters. Not only the fruits of the labors of the German editors but the original manuscript of Thayer and the mass of material which he accumulated came into the hands of this writer, and they form the foundation on which the English "Thayer's Beethoven" rests. The work is a vastly different one from that which Thayer dreamed of when he first conceived the idea of bringing order and consistency into the fragmentary and highly colored accounts of the composer's life upon which he fed his mind and fancy as a student at college; but it is, even in that part of the story which he did not write, true to the conception of what Beethoven's biography should be. Knowledge of the composer's life has greatly increased since the time when Thayer set out upon his task. The first publication of some of the results of his investigations in his "Chronologisches Verzeichniss" in 1865, and the first volume of the biography which appeared a year later, stirred the critical historians into activity throughout Europe. For them he had opened up a hundred avenues of research, pointed out a hundred subjects for special study. At once collectors of autographs brought forth their treasures, old men opened up the books of their memories, librarians gave eager searchers access to their shelves, churches produced their archives, and hieroglyphic sketches which had been scattered all over Europe were deciphered by scholars and yielded up chronological information of inestimable value. To all these activities Thayer had pointed the way, and thus a great mass of facts was added to the already great mass which Thayer had accumulated. Nor did Thayer's labors in the field end with the first publication of his volumes. So long as he lived he gathered, ordered and sifted the new material which came under his observation and prepared it for incorporation into later editions and later volumes. After he was dead his editors continued the work.

Alexander Wheelock Thayer was born in South Natick, Massachusetts, on October 22nd, 1817, and received a liberal education at Harvard College, whence he was graduated in 1843. He probably felt that he was cut out for a literary career, for his first work after graduation was done in the library of his _Alma Mater_. There interest in the life of Beethoven took hold of him. With the plan in his mind of writing an account of that life on the basis of Schindler's biography as paraphrased by Moscheles, and bringing its statements and those contained in the "Biographische Notizen" of Wegeler and Ries and a few English accounts into harmony, he went to Europe in 1849 and spent two years in making researches in Bonn, Berlin, Prague and Vienna. He then returned to America and in 1852 became attached to the editorial staff of "The New York Tribune." It was in a double sense an attachment; illness compelled him to abandon journalism and sever his connection with the newspaper within two years, but he never gave up

his interest in it. He read it until the day of his death, and his acquaintance with the member of the Tribune's staff who was destined to have a part in the completion of his lifework began when, a little more than a generation after he had gone to Europe for the second time, he opened a correspondence with him on a topic suggested by one of this writer's criticisms. In 1854 he went to Europe again, still fired with the ambition to rid the life-history of Beethoven of the defects which marred it as told in the current books. Schindler had sold the _memorabilia_ which he had received from Beethoven and Beethoven's friend Stephan von Breuning to the Prussian Government, and the precious documents were safely housed in the Royal Library at Berlin. It was probably in studying them that Thayer realized fully that it was necessary to do more than rectify and harmonize current accounts of Beethoven's life if it were correctly to be told. He had already unearthed much precious ore at Bonn, but he lacked the money which alone would enable him to do the long and large work which now loomed before him. In 1856 he again came back to America and sought employment, finding it this time in South Orange, New Jersey, where Lowell Mason employed him to catalogue his musical library. Meanwhile Dr. Mason had become interested in his great project, and Mrs. Mehetabel Adams, of Cambridge, Massachusetts, also. Together they provided the funds which enabled him again to go to Europe, where he now took up a permanent residence. At first he spent his time in research-travels, visiting Berlin, Bonn, Cologne, Düsseldorf (where he found material of great value in the archives of the old Electoral Courts of Bonn and Cologne), Frankfort, Paris, Linz, Graz, Salzburg, London and Vienna. To support himself he took a small post in the Legation of the United States at Vienna, but exchanged this after a space for the U. S. Consulship at Trieste, to which office he was appointed by President Lincoln on the recommendation of Senator Sumner. In Trieste he remained till his death, although out of office after October 1st, 1882. To Sir George Grove he wrote under date June 1st, 1895: "I was compelled to resign my office because of utter inability longer to continue Beethoven work and official labor together." From Trieste, when his duties permitted, he went out on occasional exploring tours, and there he weighed his accumulations of evidence and wrote his volumes.

In his travels Thayer visited every person of importance then living who had been in any way associated with Beethoven or had personal recollection of him--Schindler, the composer's factotum and biographer; Anselm Hüttenbrenner, in whose arms he died; Caroline van Beethoven, widow of Nephew Karl; Charles Neate and Cipriani Potter, the English musicians who had been his pupils; Sir George Smart, who had visited him to learn the proper interpretation of the Ninth Symphony; Moscheles, who had been a professional associate in Vienna; Otto Jahn, who had undertaken a like task with his own, but abandoned it and turned over his gathered material to him; Mähler, an artist who had painted Beethoven's portrait; Gerhard von Breuning, son of Beethoven's most intimate friend, who as a lad of fourteen had been a cheery companion of the great man when he lay upon his fatal bed of sickness;--with all these and many others he talked, carefully recording their testimony in his note-books and piling up information with which to test the correctness of traditions and printed accounts and to amplify the veracious story of Beethoven's life. His industry, zeal, keen power of analysis, candor and fairmindedness won the confidence and help of all with whom he came in contact except the literary charlatans whose romances he was bent on destroying in the interest of the verities of history. The Royal Library at Berlin sent the books in which many of Beethoven's visitors had written down their part of the conversations which the composer could not hear, to him at Trieste so that he might transcribe and study them at his leisure.

In 1865, Thayer was ready with the manuscript for Volume I of the work, which contained a sketch of the Courts of the Electors of Cologne at Cologne and Bonn for over a century, told of the music cultivated at them and recorded the ancestry of Beethoven so far as it had been discovered. It also carried the history of the composer down to the year 1796. In Bonn, Thayer had made the acquaintance of Dr. Hermann Deiters, Court Councillor and enthusiastic musical littérateur, and to him he confided the task of editing and revising his manuscript and translating it into German. The reason which Thayer gave for not at once publishing his work in English was that he was unable to oversee the printing in his native land, where, moreover, it was not the custom to publish such works serially. He urged upon his collaborator that he practise literalness of translation in respect of his own utterances, but gave him full liberty to proceed according to his judgment in the presentation of documentary evidence. All of the material in the volume except the draughts from Wegeler, Ries and Schindler, with which he was frequently in conflict, was original discovery, the result of the labors begun in Bonn in 1849. His principles he set forth in these words: "I fight for no theories, and cherish no prejudices; my sole point of view is the truth.... I have resisted the temptation to discuss the character of his (Beethoven's) works and to make such a discussion the foundation of historical speculation, preferring to leave such matters to those who have a greater predilection for them. It appears to me that Beethoven the _composer_ is amply known through his works and in this assumption the long and wearisome labors of so many years were devoted to Beethoven the _man_." The plan to publish his work in German enabled Thayer to turn over all his documentary evidence to Deiters in its original shape, a circumstance which saved him great labor, but left it for his American editor and continuator. The first German volume appeared in 1866; its stimulative effect upon musical Europe has been indicated. Volume II came from the press in 1872, Volume III in 1879, both translated and

annotated by Deiters. They brought the story of Beethoven's life down to the end of the year 1816, leaving a little more than a decade still to be discussed.

The health of Thayer had never been robust, and the long and unintermittent application to the work of gathering and weighing evidence had greatly taxed his brain. He became subject to severe headaches and after the appearance of the third volume he found it impossible to apply himself for even a short time to work upon the biography. In July, 1890, he wrote a letter to Sir George Grove which the latter forwarded to this writer. In it he tells in words of pathetic gratitude of the unexpected honors showered upon him at Bonn when at the invitation of the Beethoven-Haus Verein he attended the exhibition and festival given in Beethoven's birthplace a short time before. Then he proceeds: "Of course the great question was on the lips of all: When will the fourth volume appear? I could only say: When the condition of my head allows it. No one could see or have from my general appearance the least suspicion that I was not in mental equal to my physical vigor. In fact, the extreme excitement of these three weeks took off for the time twenty years of my age and made me young again; but afterwards in Hamburg and in Berlin the reaction came. Spite of the delightful musical parties at Joachim's, Hausmann's, Mendelssohn's ... my head broke down more and more, and since my return hither, July 3rd, has as yet shown small signs of recuperation. The extreme importance of working out my fourth volume is more than ever impressed upon my mind and weighs upon me like an incubus. But as yet it is still utterly impossible for me to really work. Of course I only live for that great purpose and do not despair. My general health is such that I think the brain must in time recover something of its vigor and power of labor. What astonishes me and almost creates envy is to see this wonderful power of labor as exemplified by you and my neighbor, Burton. But from boyhood I have had head troubles, and what I went through with for thirty years in supporting myself and working on Beethoven is not to be described and excites my wonder that I did not succumb. Well, I will not yet despair." Thayer's mind, active enough in some things, refused to occupy itself with the Beethoven material; it needed distraction, and to give it that he turned to literary work of another character. He wrote a book against the Baconian authorship of Shakespeare's works; another on the Hebrews in Egypt and their Exodus (which Mr. E. S. Willcox, a friend of many years, published at his request in Peoria, Illinois). He also wrote essays and children's tales. Such writing he could do and also attend to his consular duties; but an hour or two of thought devoted to Beethoven, as he said in a letter to the present writer, brought on a racking headache and unfitted him for labor of any kind.

Meanwhile year after year passed by and the final volume of the biography was no nearer its completion than in 1880. In fact, beyond the selection and ordination of its material, it was scarcely begun. His friends and the lovers of Beethoven the world over grew seriously concerned at the prospect that it would never be completed. Sharing in this concern, the editor of the present edition developed a plan which he thought would enable Thayer to complete the work notwithstanding the disabilities under which he was laboring. He asked the coöperation of Novello, Ewer & Co., of London, and got them to promise to send a capable person to Trieste to act as a sort of literary secretary to Thayer. It was thought that, having all the material for the concluding volume on hand chronologically arranged, he might talk it over with the secretary, but without giving care to the manner of literary presentation. The secretary was then to give the material a proper setting and submit it to Thayer for leisurely revision. Very hopefully, and with feelings of deep gratitude to his friends, the English publishers, the American editor submitted his plan; but Thayer would have none of it. Though unable to work upon the biography for an hour continuously, he yet clung to the notion that some day he would not only finish it but also rewrite the whole for English and American readers. From one of the letters placed at my disposal by Sir George Grove, it appears that subsequently (in 1892) there was some correspondence between an English publisher and Mr. Thayer touching an English edition. The letter was written to Sir George on June 1st, 1895. In it he says: "I then hoped to be able to revise and prepare it (the Beethoven MS.) for publication myself, and was able to begin the labor and arrange with a typewriting woman to make the clean copy. How sadly I failed I wrote you. Since that time the subject has not been renewed between us. I am now compelled to relinquish all hope of ever being able to do the work. There are two great difficulties to be overcome: the one is that all letters and citations are in the original German as they were sent to Dr. Deiters; the other, there is much to be condensed, as I always intended should be for this reason: From the very first chapter to the end of Vol. III, I am continually in conflict with all previous writers and was compelled, therefore, to show in my text that I was right by so using my materials that the reader should be taken along step by step and compelled to see the truth for himself. Had all my arguments been given in notes nine readers out of ten would hardly have read them, and I should have been involved in numberless and endless controversies. Now the case is changed. A. W. T's novelties are now, with few if any exceptions, accepted as facts and can, in the English edition, be used as such. Besides this, there is much new matter to be inserted and some corrections to be made from the appendices of the three German volumes. The prospect now is that I may be able to do some of this work, or, at all events, go through my MS. page by page and do much to facilitate its preparation for publication in English. I have no expectation of ever receiving any pecuniary recompense for my 40 years of labor, for my many years of poverty arising from the costs of my extensive researches, for my--but

enough of this also." In explanation of the final sentence in this letter it may be added that Thayer told the present writer that he had never received a penny from his publisher for the three German volumes; nothing more, in fact, than a few books which he had ordered and for which the publisher made no charge.

Thus matters rested when Thayer died on July 15th, 1897. The thought that the fruits of his labor and great sacrifices should be lost to the world even in part was intolerable. Dr. Deiters, with undiminished zeal and enthusiasm, announced his willingness to revise the three published volumes for a second edition and write the concluding volume. Meanwhile all of Thayer's papers had been sent to Mrs. Jabez Fox of Cambridge, Massachusetts, the author's niece and one of his heirs. There was a large mass of material, and it became necessary to sift it in order that all that was needful for the work of revision and completion might be placed in the hands of Dr. Deiters. This work was done, at Mrs. Fox's request, by the present writer, who, also at Mrs. Fox's request, undertook the task of preparing this English edition. Dr. Deiters accomplished the work of revising Volume I, which was published by Weber, the original publisher of the German volumes, in 1891. He then decided that before taking up the revision of Volumes II and III he would bring the biography to a conclusion. He wrote, not the one volume which Thayer had hoped would suffice him, but two volumes, the mass of material bearing on the last decade of Beethoven's life having grown so large that it could not conveniently be comprehended in a single tome, especially since Dr. Deiters had determined to incorporate critical discussions of the composer's principal works in the new edition. The advance sheets of Volume IV were in Dr. Deiters's hands when, full of years and honors, he died on May 1st, 1907. Breitkopf and Härtel had meanwhile purchased the German copyright from Weber, and they chose Dr. Hugo Riemann to complete the work of revision. Under Dr. Riemann's supervision Volumes IV and V were brought out in 1908, and Volumes II and III in 1910-1911.

Not until this had been accomplished could the American collaborator go systematically to work on his difficult and voluminous task, for he had determined to use as much as possible of Thayer's original manuscript and adhere to Thayer's original purpose and that expressed in his letter to Sir George Grove. He also thought it wise to condense the work so as to bring it within three volumes and to seek to enhance its readableness in other ways. To this end he abolished the many appendices which swell the German volumes, and put their significant portions into the body of the narrative; he omitted many of the hundreds of foot-notes, especially the references to the works of the earlier biographers, believing that the special student would easily find the sources if he wished to do so, and the general reader would not care to verify the statements of one who has been accepted as the court of last resort in all matters of fact pertaining to Beethoven, the man; he also omitted many letters and presented the substance of others in his own words for the reason that they can all be consulted in the special volumes which contain the composer's correspondence; of the letters and other documents used in the pages which follow, he made translations for the sake of accuracy as well as to avoid conflict with the copyright privileges of the publishers of English versions. Being as free as the German editors in respect of the portion of the biography which did not come directly from the pen of Thayer, the editor of this English edition chose his own method of presentation touching the story of the last decade of Beethoven's life, keeping in view the greater clearness and rapidity of narrative which, he believed, would result from a grouping of material different from that followed by the German editors in their adherence to the strict chronological method established by Thayer.

A large number of variations from the text of the original German edition are explained in the body of this work or in foot-notes. In cases where the German editors were found to be in disagreement with the English manuscript in matters of opinion merely, the editor has chosen to let Mr. Thayer's arguments stand, though, as a rule, he has noted the adverse opinions of the German revisers also. A prominent instance of this kind is presented by the mysterious love-letter found secreted in Beethoven's desk after his death. Though a considerable literature has grown up around the "Immortal Beloved" since Thayer advanced the hypothesis that the lady was the Countess Therese Brunswick, the question touching her identity and the dates of the letters is still as much an open one as it was when Thayer, in his characteristic manner, subjected it to examination. This editor has, therefore, permitted Thayer not only to present his case in his own words, but helped him by bringing his scattered pleadings and briefs into sequence. He has also outlined in part the discussion which followed the promulgation of Thayer's theory, and advanced a few fugitive reflections of his own. The related incident of Beethoven's vain matrimonial project has been put into a different category by new evidence which came to light while Dr. Riemann was engaged in his revisory work. It became necessary, therefore, that the date of that incident be changed from 1807, where Thayer had put it, to 1810. By this important change Beethoven's relations to Therese Malfatti were made to take on a more serious attitude than Thayer was willing to accord them.

In this edition, finally, more importance is attached to the so-called Fischer Manuscript than Thayer was inclined to give it, although he, somewhat grudgingly we fear, consented that Dr. Deiters should print it with critical comments in the Appendix of his Vol. I. The manuscript, though known to Thayer, had come to the attention of Dr. Deiters too late for use in the narrative portion of the volume,

though it was thus used in the second edition. The story of the manuscript, which is now preserved in the museum of the Beethoven-Haus Verein in Bonn, is a curious one. Its author was Gottfried Fischer, whose ancestors for four generations had lived in the house in the Rheingasse which only a few years ago was still, though mendaciously, pointed out to strangers as the house in which Beethoven was born. Fischer, who lived till 1864, was born in the house which formerly stood on the site of the present building known as No. 934, ten years after Beethoven's eyes opened to the light in the Bonngasse. At the time of Fischer's birth the Beethoven family occupied a portion of the house and Fischer's father and the composer's father were friends and companions. There, too, had lived the composer's grandfather. Gottfried Fischer had a sister, Cäcilia Fischer, who was born eight years before Beethoven; she remained unmarried and lived to be 85 years old, dying on May 23rd, 1845. The festivities attending the unveiling of the Beethoven monument in 1838 brought many visitors to Bonn and a natural curiosity concerning the relics of the composer. Inquirers were referred to the house in the Rheingasse, then supposed to be the birthplace of the composer, where the Fischers, brother and sister, still lived. They told their story and were urged by eager listeners to put it into writing. This Gottfried did the same year, but, keeping the manuscript in hand, he added to it at intervals down to the year 1857 at least. He came to attach great value to his revelations and as time went on embellished his recital with a mass of notes, many of no value, many consisting of iterations and reiterations of incidents already recorded, and also with excerpts from books to which, in his simplicity, he thought that nobody but himself had access. He was an uneducated man, ignorant even of the correct use of the German language; it is, therefore, not surprising that much of his record is utterly worthless; but mixed with the dross there is much precious metal, especially in the spinster's recollection of the composer's father and grandfather, for while Gottfried grew senile his sister remained mentally vigorous to the end. Thayer examined the document and offered to buy it, but was dissuaded by the seemingly exorbitant price which the old man set upon it. It was finally purchased for the city's archives by the Oberbürgermeister and thus came to the notice of Dr. Deiters. His use of it has been followed by the present editor.

HENRY EDWARD KREHBIEL.

Postscript

The breaking out, in August, 1914, of the war between Austria and Servia which eventually involved nearly all the civilized nations of the world, led the publishers, who had originally undertaken to print this Work as brought to a conclusion by the American Editor, indefinitely to postpone its publication. In the spring of 1920 the Beethoven Association, composed of musicians of high rank, who had given a remarkably successful series of concerts of Beethoven's chamber-music in New York in the season 1919-20, at the suggestion of O. G. Sonneck and Harold Bauer resolved to devote the proceeds of the concerts to promoting the publication of Thayer's biography. To this act of artistic philanthropy the appearance of the work is due.

Contents of Volume I

PAGE

INTRODUCTION vii

CHAPTER I. Fall of the Ecclesiastical-Civil States in Germany--Character of Their Rulers--The Electors of Cologne in the Eighteenth Century--Joseph Clemens--Clemens August--Max Friedrich--Incidents and Achievements in Their Reigns--The Electoral Courts and Their Music--Earliest Records of the Beethovens in the Rhineland--Musical Culture in Bonn at the Time of Ludwig van Beethoven's Birth--Operatic Repertories--Christian Gottlob Neefe--Appearance of the City 1

CHAPTER II. Beethoven's Ancestors in Belgium--Louis van Beethoven, His Grandfather--He Leaves His Paternal Home--Tenor Singer at Louvain--His Removal to Bonn--Marriage--Activities as Bass Singer and Chapelmaster in the Electoral Chapel--Birth and Education of Johann van Beethoven, Father of the Composer--Domestic Afflictions--His Marriage--Appearance and Character of the Composer's Mother 42

CHAPTER III. Birth of Ludwig van Beethoven, the Composer-- Conflict of Dates--The House in Which He Was Born--Poverty of the Family--An Inebriate Grandmother and a Dissipated Father--The Composer's Scant Schooling--His First Music Teachers--Lessons on the Pianoforte, Organ and Violin--Neefe Instructs Him in Composition--A Visit to Holland 53

CHAPTER IV. Beethoven a Pupil of Neefe--Early Employment of His Talent and Skill--First Efforts at Composition--Assists Neefe at the Organ in the Orchestra of the Electoral Court--Is Appointed Assistant Court Organist--Johann van Beethoven's Family--Domestic Tribulations--Youthful Publications 67

CHAPTER V. Elector Max Franz--Appearance and Character of Maria Theresias's Youngest Son--His Career in Church and State--Musical Culture in the Austrian Imperial Family--The Elector's Admiration for Mozart and Mozart's Characterization of Him--His Court Music at Bonn 77

CHAPTER VI. Beethoven Again--His Studies Interrupted--A Period of Artistic Inactivity in Bonn--The Young Organist Indulges in a Prank--A Visit to Vienna--Mozart Hears the Youthful Beethoven Play--Sympathetic Acquaintances--Death of Beethoven's Mother--Association with the von Breuning Family--Some Questions of Chronology Discussed 85

CHAPTER VII. The Family von Breuning--Beethoven Brought Under Refining Influences--Count Waldstein--Beethoven's First Mæcenas--Time of the Count's Arrival in Bonn--Beethoven Forced to Become Head of His Father's Family 98

CHAPTER VIII. The National Theatre of Elector Max Franz--Beethoven's Associates in the Court Orchestra--Anton Reicha--Andreas and Bernhard Romberg--His Practical Experience in the Electoral Band--The Operatic Repertory of Five Years in the Court Theatre 105

CHAPTER IX. The Last Three Years of Beethoven's Life in Bonn--Gleanings of Fact and Anecdote--A Visit from Haydn--Merry Journey up the Rhine--Beethoven's Meeting with Abbé Sterkel--He Extemporizes--His Playing Described by Carl Ludwig Junker--He Shows a Cantata to Haydn--The Extent of Max Franz's Patronage of the Composer--Social and Artistic Life in Bonn--Madame von Breuning a Guardian Angel--The Circle of Companions--Friendships with Young Women--Jeannette d'Honrath--Fräulein Westerhold--Eleonore von Breuning--Beethoven Leaves Bonn Forever--The Parting with His Friends--Incidents of His Journey to Vienna 110

CHAPTER X. Beethoven's Creative Activity in Bonn--An Inquiry into the Genesis of Many Compositions--The Cantatas on the Death of Joseph II and the Elevation of Leopold II--Vicissitudes of These Compositions--A Group of Songs--The "Ritterballet" and Other Instrumental Works--Several Chamber Compositions--The String Trio, Op. 3, Carried to England--Manuscripts Taken by Beethoven from Bonn to Vienna 129

CHAPTER XI. Beethoven in Vienna--Care for His Personal Appearance--Death of His Father--Records of Minor Receipts and Expenditures--His Studies with Haydn--Clandestine Lessons in Composition with Johann Schenk--A Rupture with Haydn--Becomes a Pupil of Albrechtsberger and Salieri--Characteristics as a Pupil 146

CHAPTER XII. Music in Vienna at the Time of Beethoven's Arrival There--Theatre, Church and Concert-Room--Salieri and the Royal Imperial Opera--Schikaneder's Theater auf der Wieden--Composers and Conductors in the Imperial Capital--Paucity of Public Concerts--A Music-loving Nobility: The Esterhazys; Kinsky; Lichnowsky; von Kees; van Swieten--Private Orchestras--Composers: Haydn, Koželuch, Förster, Eberl, Vanhall--Private Theatres 163

CHAPTER XIII. Beethoven in Society--Success as a Virtuoso--The Trios, Op. 1--Tender Memories of Friends in Bonn--A Letter to Leonore von Breuning--Wegeler Comes to Vienna--His Reminiscences--A Quarrel and Petition for Reconciliation--Irksome Social Conventions--Affairs of the Heart--Variations for Simrock--First Public Appearance as Pianist and Composer--The Pianoforte Concertos in C and B-flat--The Trios, Op. 1, Revised--Sonatas Dedicated to Haydn--Dances for the Ridotto Room--Plays at Haydn's Concert 174

CHAPTER XIV. The Years 1796 and 1797--Success Achieved in the Austrian Capital--A Visit to Prague--The Scena: "Ah, perfido!"--Sojourn in Berlin--King Frederick William II--Prince Louis Ferdinand--Violoncello Sonatas--Relations with Himmel--Plays for the Singakademie--Fasch and Zelter--War-Songs--The Rombergs--A Forgotten Riding-Horse--Compositions and Publications of the Period--Matthisson and His "Adelaide"--Quintet for Strings, Op. 4--Pieces for Wind-instruments--The "Jena" Symphony--Dances 190

CHAPTER XV. General Bernadotte--The Fiction about His Connection with the “Sinfonia eroica”--Rival Pianists--Joseph Wölffl--Tomaschek Describes Beethoven’s Playing--Dragonetti--J. B. Cramer--Beethoven’s Demeanor in Society--Compositions of 1798 and 1799--The Trios, Op. 9--Pianoforte Concertos in C and B-flat--An Unfinished Rondo for Pianoforte and Orchestra--Several Pianoforte Sonatas--“Sonate pathétique”--Trio for Pianoforte, Clarinet and Violoncello--Origin of the First Symphony--Protest Against an Arrangement of it as a Quintet 212

CHAPTER XVI. Beethoven’s Social Life in Vienna--Vogl-- Kiesewetter--Zmeskall--Amenda--Count Lichnowsky--Eppinger--Krumpholz--Schuppanzigh and His Quartet--Johann Nepomuk Hummel--Friendships with Women--Magdalene Willmann-- Christine Gerhardi--Dedications to Pupils--Countess Keglevics--Countess Henriette Lichnowsky--Countess Giulietta Guicciardi--Countess Thun--Princess Liechtenstein--Baroness Braun 229

CHAPTER XVII. Beethoven’s Character and Personality--His Disposition--Evil Effects of Early Associations and Inadequate Intellectual Training--Sentimental Ideals not Realized in Conduct--Self-sufficiency and Pride--The Homage of Young Disciples--Love of Nature--Relations with Women--Conceptions of Virtue--Literary Tastes--His Letters--The Sketchbooks--His Manner of Compositions--Origin of His Deafness 245

CHAPTER XVIII. Beethoven’s Brothers--His First Concert on His Own Account--Septet and First Symphony Performed--Punto and the Sonata for Horn--The Charlatan Steibelt Confounded--Beethoven’s Homes in Vienna--Madame Grillparzer, the Poet’s Mother--Doležalek-- Hoffmeister--E. A. Förster--The Quartets, Op. 18--Prince Lichnowsky’s Gift of a Quartet of Viols--Publications of 1800 265

CHAPTER XIX. The Year 1801--Compositions offered to Hoffmeister--Concerts for Wounded Soldiers--Vigano and the Ballet “Prometheus”--Interest in the Publication of Bach’s Works and His Indigent Daughter--Stephan von Breuning--Summer Home in Hetzendorf--Composition of “The Mount of Olives”--Compositions and Publications of the Year--The Funeral March in the Sonata, Op. 26--The So-called “Moonlight” Sonata--Inspired by a Poem of Seume’s--Illicit Publication of the String Quintet, Op. 29 281

CHAPTER XX. Important Letters of 1801--Communications to Amenda, Hoffmeister and Wegeler--The Composer’s Ill Health--The Beginning of His Deafness--Early Symptoms Described by Himself--Thoughts of Marriage--Indignation Aroused by the Criticisms of the Allgemeine Musikalische Zeitung--The “Leipsic Oxen”--Gradual Recognition of Beethoven’s Genius--Anton Reicha--Von Breuning’s Relations with Beethoven--Lessons to Ferdinand Ries and Carl Czerny 297

CHAPTER XXI. Beethoven’s Love-Affairs--Countess Guicciardi--A Conversation with Schindler about Her Marriage--Schindler’s Contradictory Story--Countess Erdödy--Schindler’s Theory Disproved--The Letter to the “Immortal Beloved”--Critical Study of its Date--Countess Guicciardi Not the Woman Addressed--A Conjecture Concerning the Countess Therese von Brunswick--Other Candidates for the Honor of Being the Object of Beethoven’s Supreme Love--Magdalena Willmann--Amalia Sebald--The Arguments of Kalischer, Mariam Tenger and Marie Lipsins (La Mara) Set Forth by the Editor of this Biography--Statements of Relations and Descendants of the Countesses Guicciardi and von Brunswick--The Memoirs of the Countess Therese--Later French Investigations 317

CHAPTER XXII. The Year 1802--The Village of Heiligenstadt-- Beethoven’s Views on Transcriptions--His Despondency--The “Heiligenstadt Will”--Confession of His Deafness--The Second Symphony--Return to Vienna--Marches for the Pianoforte, Four Hands--A Defence of Brothers Johann and Karl Kaspar--Their Characters--Karl’s Management of Beethoven’s Business Affairs--The Bagatelles, Op. 33--The Songs, Op. 52--Compositions and Publications of 1802--Three Sonatas for Pianoforte and Violin--The Sonatas for Pianoforte, Op. 31--An Alteration by Nägeli--Finale of the Sonata in D minor--Beethoven on the Character of His Variations 348

Chapter I

Introductory--The Electors of Cologne in the Eighteenth Century--Joseph Clemens, Clemens August and Max Friedrich--The Electoral Courts and Their Music--Musical Culture in Bonn at the Time of Beethoven’s Birth--Appearance of the City in 1770.

One of the compensations for the horrors of the French Revolution was the sweeping away of many of the petty sovereignties into which Germany was divided, thereby rendering in our day a union of the German People and the rise of a German Nation possible. The first to fall were the numerous ecclesiastical-civil members of the old, loose confederation, some of which had played no ignoble nor unimportant part in the advance of civilization; but their day was past. The people of these states had in divers respects

enjoyed a better lot than those who were subjects of hereditary rulers, and the old German saying: “It is good to dwell under the crook,” had a basis of fact. At the least, they were not sold as mercenary troops; their blood was not shed on foreign fields to support their princes’ ostentatious splendor, to enable mistresses and ill-begotten children to live in luxury and riot. But the antiquated ideas to which the ecclesiastical rulers held with bigoted tenacity had become a barrier to progress, the exceptions being too few to render their farther existence desirable. These members of the empire, greatly differing in extent, population, wealth and political influence, were ruled with few or no exceptions by men who owed their positions to election by chapters or other church corporations, whose numbers were so limited as to give full play to every sort of intrigue; but they could not assume their functions until their titles were confirmed by the Pope as head of the church, and by the Emperor as head of the confederation. Thus the subject had no voice in the matter, and it hardly need be said that his welfare and prosperity were never included among the motives and considerations on which the elections turned.

The sees, by their charters and statutes, we think without exception, were bestowed upon men of noble birth. They were benefices and sinecures for younger sons of princely houses; estates set apart and consecrated to the use, emolument and enjoyment of German John Lacklands. In the long list of their incumbents, a name here and there appears, that calls up historic associations;--a man of letters who aided in the increase or diffusion of the cumbrous learning of his time; a warrior who exchanged his robes for a coat of mail; a politician who played a part more or less honorable or the reverse in the affairs and intrigues of the empire, and, very rarely, one whose daily walk and conversation reflected, in some measure, the life and principles of the founder of Christianity. In general, as they owed their places wholly to political and family influences, so they assumed the vows and garb of churchmen as necessary steps to the enjoyment of lives of affluence and pleasure. So late as far into the eighteenth century, travelling was slow, laborious and expensive. Hence, save for the few more wealthy and powerful, journeys, at long intervals, to a council, an imperial coronation or a diet of the empire, were the rare interruptions to the monotony of their daily existence. Not having the power to transmit their sees to their children, these ecclesiastics had the less inducement to rule with an eye to the welfare of their subjects: on the other hand, the temptation was very strong to augment their revenues for the benefit of relatives and dependents, and especially for the gratification of their own tastes and inclinations, among which the love of splendor and ostentatious display was a fruitful source of waste and extravagance.

Confined so largely to their own small capitals, with little intercourse except with their immediate neighbors, they were far more dependent upon their own resources for amusement than the hereditary princes: and what so obvious, so easily obtained and so satisfactory as music, the theatre and the dance! Thus every little court became a conservatory of these arts, and for generations most of the great names in them may be found recorded in the court calendars. One is therefore not surprised to learn how many of the more distinguished musical composers began life as singing boys in cathedral choirs of England and Germany. The secular princes, especially those of high rank, had, besides their civil administration, the stirring events of war, questions of public policy, schemes and intrigues for the advancement of family interests and the like, to engage their attention; but the ecclesiastic, leaving the civil administration, as a rule, in the hands of ministers, had little to occupy him officially but a tedious routine of religious forms and ceremonies; to him therefore the theatre, and music for the mass, the opera, the ball-room, and the salon, were matters of great moment--they filled a wide void and were cherished accordingly.

COLOGNE AND ITS ELECTORS

The three German ecclesiastical princes who possessed the greatest power and influence were the Archbishops of Mayence, Trèves and Cologne--Electors of the Empire and rulers of the fairest regions of the Rhine. Peace appears hardly to have been known between the city of Cologne and its earlier archbishops; and, in the thirteenth century, a long-continued and even bloody quarrel resulted in the victory of the city. It remained a free imperial town. The archbishops retained no civil or political power within its walls, not even the right to remain there more than three days at any one time. Thus it happened, that in the year 1257 Archbishop Engelbert selected Bonn for his residence, and formally made it the capital of the electorate, as it remained until elector and court were swept away in 1794.

Of the last four Electors of Cologne, the first was Joseph Clemens, a Bavarian prince, nephew of his predecessor Maximilian Heinrich. The choice of the chapter by a vote of thirteen to nine had been Cardinal Fürstenberg; but his known, or supposed, devotion to the interests of the French king had prevented the ratification of the election by either the Emperor or the Pope. A new one being ordered, resulted in favor of the Bavarian, then a youth of eighteen years. The Pope had ratified his election and appointed a bishop to perform his ecclesiastical functions _ad interim_, and the Emperor invested him with the electoral dignity December 1, 1689. Vehse says of him:

Like two of his predecessors he was the incumbent of five sees; he was Archbishop of Cologne, Bishop of Hildesheim, Liège, Ratisbon and Freisingen. His love for pomp and splendor was a passion which he gratified in the magnificence of his court. He delighted to draw thither beautiful and intellectual women. Madame de Raysbeck, and Countess Fugger, wife of his chief equerry, were his declared favorites. For seventeen years, that is, until the disastrous year 1706, when Fénelon consecrated him, he delayed assuming his vows. He held the opinion, universal in the courts of those days, that he might with a clear conscience enjoy life after the manner of secular princes. In pleasing the ladies, he was utterly regardless of expense, and for their amusement gave magnificent balls, splendid masquerades, musical and dramatic entertainments, and hunting parties.

St. Simon relates that several years of his exile were passed at Valenciennes, where, though a fugitive, he followed the same round of costly pleasures and amusements. He also records one of the Elector's jests which in effrontery surpasses anything related of his contemporary, Dean Swift. Some time after his consecration, he caused public notice to be given, that on the approaching first of April he would preach. At the appointed time he mounted the pulpit, bowed gravely, made the sign of the cross, shouted "Zum April!" (April fool!), and retired amid a flourish of trumpets and the rolling of drums.

Dr. Ennen labors energetically to prove that Joseph Clemens's fondness in later years for joining in all grand church ceremonies rested upon higher motives than the mere pleasure of displaying himself in his magnificent robes; and affirms that after assuming his priestly vows he led a life devoted to the church and worthy of his order; thenceforth never seeing Madame de Raysbeck, mother of his illegitimate children, except in the presence of a third person. It seems proper to say this much concerning a prince whose electorship is the point of departure for notices of music and musicians in Bonn during the eighteenth century; a prince whose fondness for the art led him at home and in exile to support both vocal and instrumental bands on a scale generous for that age; and who, moreover, made some pretensions to the title of composer himself, as we learn from a letter which under date of July 20, 1720, he wrote to a court councillor Rauch to accompany eleven of his motets. It is an amusingly frank letter, beginning with a confession that he was an _Ignorant_ who knew nothing about notes and had absolutely no knowledge of _musique_, wherefore he admits that his manner of composing is "very odd," being compelled to sing anything that came into his head to a composer whose duty it was to bring the ideas to paper. Nevertheless he is quite satisfied with himself, "At all events I must have a good ear and _gusto_, for the public that has heard has always approved. But the _methodum_ which I have adopted is that of the bees that draw and collect the honey from the sweetest flowers; so, also, I have taken all that I have composed from good masters whose _Musikalien_ pleased me. Thus I freely confess my pilfering, which others deny and try to appropriate what they have taken from others. Let no one, therefore, get angry if he hears old arias in it, for, as they are beautiful, the old is not deprived of its praise.... I ascribe everything to the grace of God who enlightened me, the unknowing, to do these things." Not all "composers," royal or mean, are as honest as the old Elector!

It is fortunate for the present purpose, that the portion of the electoral archives discovered after a lapse of nearly seventy years and now preserved at Düsseldorf, consists so largely of documents relating to the musical establishment of the court at Bonn during the last century of its existence. They rarely afford information upon the character of the music performed, but are sufficiently complete, when supplemented by the annual Court Calendars, to determine with reasonable correctness the number, character, position and condition of its members. The few petitions and decrees hereafter to be given in full because of their connection with the Beethovens, suffice for specimens of the long series of similar documents, uniform in character and generally of too little interest to be worth transcription.

In 1695 a decree issued at Liège by Joseph Clemens, then in that city as titular bishop, though not consecrated, adds three new names to the "Hoff-Musici," one of which, Van den Eeden, constantly reappears in the documents and calendars down to the year 1782. From a list of payments at Liège in the second quarter of 1696, we find that Henri Vandeneden (Heinrich Van den Eeden) was a bass singer, and that the aggregate of vocalists, instrumentists, with the organ-blower (_calcant_), was eighteen persons.

Returned to Bonn, Joseph Clemens resumed his plan of improving his music, and for those days of small orchestras and niggardly salaries he set it upon a rather generous foundation. A decree of April 1, 1698, put in force the next month, names 22 persons with salaries aggregating 8,890 florins.

POLITICAL VICISSITUDES OF THE ELECTORATE

After the death of Maximilian Heinrich the government passed into the hands of Cardinal Fürstenberg, his coadjutor, who owed the position to the intrigues of Louis XIV, and now used it by all possible means to promote French interests. The king's troops under French commanders, he admitted into the principal towns of the electorate, and, for his own protection, a French garrison of 10,000

men into Bonn. War was the consequence; an imperial army successfully invaded the province, and, advancing to the capital, subjected its unfortunate inhabitants to all the horrors of a relentless siege, that ended October 15, 1689, in the expulsion of the garrison, now reduced to some 3900 men, of whom 1500 were invalids. Yet in the war of the Spanish Succession which opened in 1701, notwithstanding the terrible lesson taught only eleven years before, the infatuated Joseph Clemens embraced the party of Louis. Emperor Leopold treated him with singular mildness, in vain. The Elector persisted. In 1702 he was therefore excluded from the civil government and fled from Bonn, the ecclesiastical authority in Cologne being empowered by the Emperor to rule in his stead. The next year, the great success of the French armies against the allies was celebrated by Joseph Clemens with all pomp in Namur, where he then was; but his triumph was short. John Churchill, then Earl of Marlborough, took the field as commander-in-chief of the armies of the allies. His foresight, energy and astonishing skill in action justified Addison's simile--whether sublime or only pompous--of the angel riding in the whirlwind and directing the storm. He was soon at Cologne, whence he despatched Cochorn to besiege Bonn. That great general executed his task with such skill and impetuosity, that on May 15 (1703) all was ready for storming the city, when d'Allègre, the French commander, offered to capitulate, and on the 19th was allowed to retire. "Now was Bonn for the third time wrested from the hands of the French and restored to the archbishopric, but alas, in a condition that aroused indignation, grief and compassion on all sides," says Müller.

Leopold was still kindly disposed toward Joseph Clemens, but he died May 5, 1705, and his successor, Joseph I, immediately declared him under the ban of the Empire. This deprived him of the means and opportunities, as Elector, for indulging his passion for pomp and display, while his neglect hitherto, under dispensations from the Pope, to take the vows necessary to the performance of ecclesiastical functions, was likewise fatal to that indulgence as archbishop. But this could be remedied; Fénelon, the famous Archbishop of Cambray, ordained him subdeacon August 15, 1706; the Bishop of Tournay made him deacon December 8, and priest on the 25th; on January 1, 1707, he read his first mass at Lille, and indulged his passion for parade to the full, as a pamphlet describing the incident, and silver and copper medals commemorating it, still evince. "Two years later, May 1, 1709, Joseph Clemens received from Fénelon in Ryssel (Lille) episcopal consecration and the pallium."--(Müller.) Upon the victory of Oudenarde by Marlborough, and the fall of Lille, he took refuge in Mons. The treaty of Rastadt, March, 1714, restored him to his electoral dignities and he returned to the Rhine; but Dutch troops continued to hold Bonn until December 11, 1715. On the morning of that day they evacuated the city and in the afternoon the Elector entered in a grand, solemn procession commemorated by an issue of silver medals.

During all these vicissitudes Joseph Clemens, from whatever source he derived the means, did not suffer his music to deteriorate and, returned to Bonn, no sooner was the public business regulated and restored to its former routine than he again turned his attention to its improvement.

Joseph Clemens died November 12, 1723, having previously secured the succession to his nephew Clemens August, last of the five Electors of Cologne of the Bavarian line. The new incumbent, third son of Maximilian Emanuel, Elector of Bavaria and his second wife, a daughter of the celebrated John Sobieski of Poland, was born August 17, 1700, at Brussels, where his father resided at the time as Governor General. From his fourth to his fifteenth year he had been held in captivity by the Austrians at Klagenfurt and Gratz; then, having been destined for the church, he spent several years at study in Rome. As a child in 1715 he had been appointed coadjutor to the Bishop of Regensburg; in 1719 he was elected to the two sees of Paderborn and Münster made vacant by the death of his brother Moritz, was chosen coadjutor to his uncle of Cologne in 1722, made his solemn entry into Bonn as elector May 15, 1724, was the same year also elected Bishop of Hildesheim, in 1725 Provost of the Cathedral at Liège, 1728 Bishop of Osnabrück, and, finally, in 1732 reached the dignity of Grand Master of the Teutonic Order.

THE RULE OF ELECTOR CLEMENS AUGUST

His rule is distinguished in the annals of the electorate for little else than the building, repairing, renewing and embellishing of palaces, hunting-seats, churches, convents, and other edifices. At Bonn he erected the huge pile the foundation of which had been laid by his uncle, now the seat of the university. The handsome City Hall was also his work; the villa at Poppelsdorf was enlarged by him into a small palace, Clemensruhe, now the University Museum of Natural History. In Brühl, the Augustusburg, now a Prussian royal palace, dates from his reign, and Münster, Mergentheim, Arnsberg and other places show similar monuments of his prodigality in the indulgence of his taste for splendor. "Monstrous were the sums," says Dr. Ennen, "squandered by him in the purchase of splendid ornaments, magnificent equipages, furniture costly for its variety, and of curious works of art; upon festivities, sleighing-parties, masquerades, operas, dramas and ballets; upon charlatans, swindlers, female vocalists, actors and dancers. His theatre and opera alone cost him 50,000 thalers annually and the magnificence of his masked balls, twice a week in winter, is proof sufficient that no small sums were lavished upon them."

The aggregate of the revenues derived from the several states of which Clemens August was the head nowhere appears; but the civil income of the electorate alone had, in his later years, risen from the million of florins of his predecessor to about the same number of thalers--an increase of some 40 per centum; added to this were large sums derived from the church, and subsidies from Austria, France and the sea-coast states amounting to at least 14,000,000 francs; indeed, during the Elector's last ten years the French subsidies alone made an aggregate of at least 7,300,000 francs; in 1728 Holland paid on account of the Clemens Canal 76,000 thalers. At the centennial opening of the strong-box of the Teutonic Order he obtained the fat accumulations of a hundred years; and 25 years later he opened it again. Yet, though during his rule peace was hardly interrupted in his part of Europe, he plunged ever deeper and more inextricably into debt, leaving one of large proportions as his legacy to his successor. He was a bad ruler, but a kindly, amiable and popular man. How should he know or feel the value of money or the necessity of prudence? His childhood had been spent in captivity, his student years in Rome, where, precisely at that period, poetry and music were cultivated, if not in very noble and manly forms, at least with a Medicean splendor. The society of the Arcadians was in full activity. True, both Clemens August and his brother were under the age which enabled them to be enrolled as "Shepherds," and consequently their names appear neither in Crescembini nor in Quadrio; but it is not to be supposed that two young princes, already bishops by election and certain of still higher dignities in the future, were excluded from the palaces of Ruspoli and Ottoboni, from those brilliant literary, artistic and luxurious circles in which, only half a dozen years before, their young countryman, the musician Handel, had found so cordial a welcome. Those were very expensive tastes, as the citation from Ennen shows, which the future elector brought with him from Rome. Italian palaces, Italian villas, churches, gardens, music, songstresses, mistresses, an Italian holy staircase on the Kreuzberg (leading to nothing); Italian pictures, mosaics and, what not? All these things cost money--but must he not have them?

This elector is perhaps the only archbishop on record to whose epitaph may truthfully be added: "He danced out of this world into some other";--which happened in this wise: Having, in the winter of 1760-61, by some unexpected stroke of good fortune, succeeded in obtaining from the usually prudent and careful bankers of Holland a loan of 80,000 thalers, he embraced the opportunity of making a long-desired visit to his family in Munich. Owing to a sudden attack of illness he was once on the point of turning back soon after leaving Bonn. He persevered, however, reached Coblenz and crossed over to the palace of the Elector of Trèves at Ehrenbreitstein, where he arrived at 4 P.M. February 5, 1761. At dinner an hour later he was unable to eat; but at the ball, which followed, he could not resist the fascination of the Baroness von Waldendorf--sister of His Transparency of Trèves--and danced with her "eight or nine turns." Of course he could not refuse a similar compliment to several other ladies. The physical exertion of dancing, joined to the excitement of the occasion and following a dreary winter-day's journey, was too much for the enfeebled constitution of a man of sixty years. He fainted in the ballroom, was carried to his chamber and died next day.

APPOINTMENTS IN THE ELECTORAL CHAPEL

It seems to have been the etiquette, that when an elector breathed his last, the musical chapel expired with him. At all events, no other explanation appears of the fact that so many of the petitions for membership, which are still preserved, should be signed by men who had already been named in the Court Calendars. It is also to be remarked that some of the petitioners receive appointments "without salary." These seem to have been appointments of the kind, which in later years were distinguished in the records and in the calendars by the term "accessist," and which, according to the best lights afforded by the archives, may be considered as having been provisional, until the incumbent had proved his skill and capacity, or until a vacancy occurred through the death or resignation of some old member. There are indications that the "accessists," though without fixed salary, received some small remuneration for their services; but this is by no means certain. It would seem that both vocalists and instrumentists who received salaries out of the state revenues were limited to a fixed number; that the amount of funds devoted to this object was also strictly limited and the costs incurred by the engagement of superior artists with extra salaries, or by an increase of the number, were defrayed from the Elector's privy purse; that the position of "accessist" was sought by young musicians as a stepping-stone to some future vacancy which, when acquired, insured a gradually increasing income during the years of service and a small pension when superannuated; that the etiquette of the court demanded, even in cases when the Elector expressly called some distinguished artist to Bonn, that the appointment should be apparently only in gracious answer to an humble petition, and that, with few exceptions, both singers and members of the orchestra were employed in the church, the theatre and the concert-room.

Clemens August made his formal entry into Bonn, May 15, 1724. A number of petitions are passed over, but one granted "without salary" on February 18, 1727, from Van den Eeden must be given in its entirety:

Supplique tres humble a S. A. S. E. de Cologne pour Gille Vandeneet. BONN, d. 18 Feb., 1727.

Prince Serenissime, Monsigneur.

Vandeneet vient avec tout le respect qui luy est possible se mettre aux pieds de V. A. S. E. luy representer qu'ayant eu l'honneur d'avoir estre second organiste de feu S. A. S. E. d'heureuse memoire, elle daigne luy vouloir faire la même grace ne demendant aucun gage si long tems qu'il plaira a V. A. S. E. promettant la servire avec soin et diligence.

Quoi faisant etc. etc.

On the same date Van den Eeden received his appointment as second court organist. June 8, 1728, a decree is issued granting him a salary of 100 florins. To a third petition the next year, signed Van den Enden, the answer is an increase of his salary to 200 thalers, and thus a future instructor of Ludwig van Beethoven becomes established in Bonn. The records need not concern us now until we reach the following, which forms part of the history of the grandfather of the subject of this biography:

March, 1733,

DECRETUM For Ludovicum van Beethoven as Electoral Court Musician.

Cl. A. Whereas His Serene Highness Elector of Cologne, Duke Clemens August in Upper and Lower Bavaria, etc. Our Gracious Lord having, on the humble petition of Ludovico van Beethoven, graciously declared and received him as Court Musician, and assigned him an annual salary of 400 florins Rhenish, the present decree under the gracious hand of His Serene Electoral Highness and the seal of the Privy Chancellor, is granted to him, and the Electoral Councillor and Paymaster Risack is herewith commanded to pay the said Beethoven the 400 fl. _quartaliter_ from the beginning of this year and to make a proper accounting thereof. B... March, 1733.

Thirteen years later we find this:

Allowance of an additional 100 Thalers annually to the Chamber Musician van Beethoven.

Inasmuch as His Serene Highness Elector of Cologne, Duke Clement August of Upper and Lower Bavaria, our most Gracious Lord has increased the salary of his Chamber Musician van Beethoven by the addition of 100 thalers annually which became due through the death of Joseph Kayser, instrument maker, the Court Chamber Councillor and Paymaster Risach is hereby informed and graciously commanded to pay to him the said Beethoven the 100 fl. a year in quarterly installments against voucher from the proper time and to make the proper accounting. Witness, etc. Poppelsdorf, August 22, 1746.

On May 2, 1747, Johann Ries became Court Trumpeter with a salary of 192 thalers. This is the first representative we have met of a name which afterwards rose to great distinction, not only in the orchestra of the Elector but also in the world at large. On March 5, 1754, he was formally appointed Court Musician (violinist) having set forth in his petition that instead of confining himself to the trumpet he had made himself serviceable in the chapel by singing and playing other instruments. Later he took ill and was sent to Cologne. We shall presently meet his two daughters and his son Franz Ries, the last of whom will figure prominently in the life-history of Beethoven. Under date March 27, 1756, occur several papers which have a double interest. They relate to the Beethoven family and are so complete as to exhibit the entire process of appointment to membership in the electoral chapel. The original documents are not calculated to give the reader a very exalted idea of the orthographical knowledge of the petitioner or the Chamber Music Director Gottwaldt; but that fault gives us the clue to the correct pronunciation of the name Beethoven--the English "Beet-garden."

JOHANN VAN BEETHOVEN BECOMES "ACCESSIST"

To His Electoral Serenity of Cologne, etc. My most Gracious Lord the humble petition and prayer of Joan van Biethoffen.

Most Reverend, most Serene Elector, Most Gracious Lord, Lord, etc.

May it please your Electoral Serenity graciously to hear the humble representations how in the absence of voices in Your Highness's Court Chapel my insignificant self took part in the music for at least four years without the good fortune of having allotted by Your Serene Electoral Highness a small _salario_.

I therefore pray Your Serene Electoral Highness most humbly that it graciously please you (in consideration of my father's faithful service for 23 years) to rejoice me with a decree as court musician, which high grace will infuse me with zeal to serve Your Serene

Highness with the greatest fidelity and zealousness.

Your Serene Electoral Highness's Most humble-obedient-faithful servant, Joan van Biethoffen.

To the Music Director Gottwaldt for a report of his humble judgment. Attestation by the most gracious sign manual and seal of the privy chancellary.

Bonn, March 19, 1756. (Signed) Clemens August (L.S.)

Most reverend, most serene Elector, Most gracious Lord, Lord, etc.

Your Serene Electoral Highness has referred to my humble judgment the petition of Joan van Piethoffen, the supplicant prays Your Electoral Highness for a gracious decree as accessist in the court music, he has indeed served for two years with his voice on the Duc Sall (doxal), hopes in time to deserve the good will of Your Serene Highness by his industry, and his father who enjoys the grace of serving Your Highness as bass singer prays his appointment, I pray most humbly and obediently for instruction concerning your Highness's good will in the matter, submit myself humbly and obediently to Your Serene Highness's grace and remain in greatest humility.

Your Serene and Electoral Highness's Most Humble and obedient servant Gottwaldt, Director of the Chamber Music.

A further report was made to the Elector as follows:

BONN, March 27, 1756. _Coloniensis gratiosa._

Chamber Music Director Gottwaldt _ad supplicam_ of Joan van Betthoffen has served two years on the docsal and hopes through his industry to serve further to the satisfaction of Your Electoral Highness, to which end his father who through Your Highness's grace serves as bass singer will seek completely to qualify him which may it please Your Serene Highness to allow.

Idem Gottwaldt _ad supplicam_ Ernest Haveckas, accessist in the court music, reports that suppliant, though not fully capable as yet hopes by special diligence to make himself worthy of Your Highness's service and would be encouraged and rejoiced in his efforts if Your Serene Highness would graciously deign to grant him a _decreto_, humbly praying to be informed as to Your Highness's wishes in the matter.

DECRETUM

Court Musician's Decree for Johan van Biethofen.

Clm. A. Whereas His Serene Electoral Highness of Cologne, Duke Clement August in Upper and Lower Bavaria etc. Our Gracious Lord on the humble petition of Johan van Biethofen and in consideration of his skill in the art of singing, also the experience in the same already gained, having graciously declared and accepted him as court musician, appoint and accept him by this writing; therefore the said Biethofen receives this decree with the gracious sign manual and seal of the Privy Chancellary, and those who are concerned to recognize him hereafter as an Electoral court musician and to pay him such respect as the position deserves.

Bonn, March 25, 1756.

Johann van Beethoven was 16 years old at this time. Why he should appear in the Court Calendar as an _accessist_ four years after the publication of this decree appointing him Court Musician does not appear.

THE DUTIES OF COURT CHAPELMASTERS

But slender success has rewarded the search for means of determining the character and quality of that opera and music, upon which, according to Ennen, Clemens August lavished such large sums. The period embraced in that elector's rule (1724-1761) was precisely that in which the _old_ Italian opera, the oratorio and the sacred cantata reached their extreme limits of development through the genius of Handel and J. S. Bach. It closes at the moment when Gluck, C. P. E. Bach and Joseph Haydn were laying the immovable foundations of a new operatic, orchestral and pianoforte music, and before the perfected sonata-form, that found universal adoption in all compositions of the better class, not vocal. Little music comparatively was issued from the press in those days, and consequently new forms and new styles made their way slowly into vogue. Another consequence was that the offices of composer for the chamber, the church, the comedy, or however they were named, were by no means sinecures--neither at the

imperial court of Maria Theresia, nor at the court of any petty prince or noble whose servants formed his orchestra. Composers had to furnish music on demand and as often as was necessary, as the hunter delivered game or the fisherman fish. What a volume of music was produced in this manner can be seen in the case of Joseph Haydn at Esterhaz, whose fruitfulness did not, in all probability, exceed that of many another of his contemporaries. The older Telemann furnished compositions to the courts of Bayreuth and Eisenach as well as the Gray Friars at Frankfort-on-the-Main, and also performed his duties as musical director and composer at Hamburg. He wrote music with such ease that, as Handel said, he could write for eight voices as rapidly as an ordinary man could write a letter. Under such conditions did the men write who are mentioned as official composers in our narrative. It is probable that not a note of theirs remains in existence, and equally probable that the loss is not at all deplorable except as it leaves the curiosity of an antiquary unsatisfied. A few text-books to vocal pieces performed on various occasions during this reign have been preserved, their titles being “Componimento per Musica,” music by Giuseppe dall’Abaco, Director of the Chamber Music (1740); “La Morte d’Abel” (no date is given, but “il Signor Biethoven” sang the part of _Adamo_); “Esther” (“From the Italian of S. F. A. Aubert,” the text partly in German, partly in Italian); “Anagilda” (_Drama per Musica_).

After the unlucky ball at Ehrenbreitstein the crook and sceptre of Cologne passed from the Bavarian family which had so long held them into the hands of Maximilian Friedrich of the Suabian line Königsegg- (or Königseck-) Rothenfels. For a century or more this house had enjoyed fat livings in the church at Cologne, in which city the new elector was born on May 13, 1708. He was the fourth of his race who had held the important office of Dean of the Cathedral, from which post he was elevated to the electorship on April 6, 1761, and to the ecclesiastical principality of Münster the next year; with which two sees he was fain to be content. He was by nature an easy, good-tempered, indolent, friendly man, of no great force of character--qualities which in the incumbent of a rich sinecure just completing his fifty-third year, would be too fully confirmed and developed by habit to change with any change of circumstances; and which, says Stramberg, made him unusually popular throughout the land despite the familiar little verse:

Bei Clemens August trug man blau und weiss, Da lebte man wie im Paradeis; Bei Max Friedrich trug man sich schwarz und roth, Da litt man Hunger wie die schwere Noth.

The condition of the finances had become such through the extravagant expenditures of Clemens August that very energetic measures were necessary, and to the effects of these, during the first few years of Max Friedrich’s rule, in throwing many persons out of employment, these doggerel lines doubtless owe their origin.

MAX FRIEDRICH AND HIS MINISTER

It was fortunate for the Elector’s subjects that his indolence was made good by the activity and energy of a prime minister who found his beau ideal of a statesman in Frederick II of Prussia, whom, in his domestic policy, he imitated as far as the character of the two governments allowed. This was equally if not more true in the principality of Münster. To the respect which one must feel for the memory of Belderbusch, the all-powerful minister at Bonn, is added, in the case of Fürstenberg, the equally powerful minister at Münster, admiration and regard for the man. The former was respected, feared, but not loved in the electorate; the latter was respected and very popular in the principality. To Kasper Anton von Belderbusch the new Elector owed his elevation; to his care he entrusted the state; to his skill and strength of character he was indebted for release from the pecuniary difficulties which beset him and for the satisfaction, as the years rolled by, of seeing his states numbered among the most prosperous and flourishing in Germany. Belderbusch’s first care was to reduce the expenditure. “He put a stop to building,” says Ennen, “dismissed a number of the actors, restricted the number of concerts and court balls, dispensed with the costly hunts, reduced the salaries of court officials, officers and domestics, lessened the _état_ for the kitchen, cellar and table of the prince, turned the property left by Clemens August into money and comforted the latter’s creditors with the hope of better times.” But though economy was the rule, still, where the Elector considered it due to his position, he could be lavish. Whatever opinions may be entertained as to the wisdom and expediency of clothing ecclesiastics with civil power, it would be unjust not to give the bright as well as the dark side of the picture. This is well put by Kaspar Risbeck in relation to the Rhenish states whose princes were churchmen, and his remarks are in place here, since they relate in part to that in which the childhood and youth of Beethoven were spent.

The whole stretch of the country from here to Mayence is one of the richest and most populous in Germany. Within this territory of 18 German miles there are 20 cities lying hard by the shore of the Rhine and dating, for the greater part, from the period of the Romans. It is still plainly to be seen that this portion of Germany was the first to be built up. Neither morasses nor heaths interrupt the evidences of cultivation which stretch with equal industry far from the shores of the river over the contiguous country. While many cities and castles built under Charlemagne and his successors, especially Henry I, in other parts of Germany have fallen into decay, all in this section have not only been preserved but many have been added to them.... The natural wealth of the soil in

comparison with that of other lands, and the easy disposition of its products by means of the Rhine, have no doubt contributed most to these results. Nevertheless, great as is the prejudice in Germany against the ecclesiastical governments, they have beyond doubt aided in the blooming development of these regions. In the three ecclesiastical electorates which make up the greater part of this tract of land nothing is known of those tax burdens under which the subjects of so many secular princes of Germany groan. These princes have exceeded the old assessments but slightly. Little is known in their countries of serfdom. The appanage of many princes and princesses do not force them to extortion. They have no inordinate military institution, and do not sell the sons of their farmers; and they have never taken so active a part in the domestic and foreign wars of Germany as the secular princes. Though they are not adept in encouraging their subjects in art culture, varied agriculture has been developed to a high degree of perfection throughout the region. Nature does of its own accord what laws and regulations seek to compel, as soon as the rocks of offence are removed from the path.[1]

Henry Swinburne, whose letters to his brother were published long after his death under the title of “The Courts of Europe,” writes under date of November 29, 1780:

Bonn is a pretty town, neatly built, and its streets tolerably well paved, all in black lava. It is situated in a flat near the river. The Elector of Cologne’s palace faces the South entry. It has no beauty of architecture and is all plain white without any pretensions.

We went to court and were invited to dine with the Elector (Königsegge). He is 73 years old, a little, hale, black man, very merry and affable. His table is none of the best; no dessert wines handed about, nor any foreign wines at all. He is easy and agreeable, having lived all his life in ladies’ company, which he is said to have liked better than his breviary. The captains of his guard and a few other people of the court form the company, amongst whom were his two great-nieces, Madame de Hatzfeld and Madame de Taxis. The palace is of immense size, the ball-room particularly large and low.... The Elector goes about to all the assemblies and plays at Tric-trac. He asked me to be of his party but I was not acquainted with their way of playing. There is every evening an assembly or play at court. The Elector seems very strong and healthy, and will, I think, hold the Archduke a good tug yet.

This Archduke was Max Franz, youngest son of Maria Theresia, whose acquaintance Swinburne had made in Vienna, and who had just been chosen coadjutor to Max Friedrich. A curious proof of the liberality, not to say laxity, of the Elector’s sentiments in one direction is given by Stramberg in his “Rheinischer Antiquarius,” to wit, the possession of a mistress in common by him and his minister Belderbusch--the latter fathering the children--and this mistress was the Countess Caroline von Satzenhofen, Abbess of Vilich!

CHAPELMASTER LUDWIG VAN BEETHOVEN

The reduction which was made by Belderbusch upon the accession of Max Friedrich in the expenses of the theatre and other amusements does not appear, except in the case of the chapelmaster, to have extended to the court music proper, nor to have been long continued in respect to the “operetta and comedy.” The first in order of the documents and notices discovered relating to the musical establishment of this Elector are of no common interest, being the petition of a candidate for the vacant office of chapelmaster and the decree appointing him to that position. They are as follows:

Very Reverend Archbishop and Elector most gracious Lord Lord!

May it please Your Electoral Grace to permit a representation of my faithfully and dutifully performed services for a considerable space as vocalist as well as, since the death of the chapelmaster, for more than a year his duties _in Dupplo_, that is to say by singing and wielding the baton concerning which my demand still remains _ad referendum_ much less have I been assured of the position. Inasmuch as because of particular _recommendation_ Dousmoulin was preferred over me, and indeed unjustly, I have been forced hitherto to submit to fate.

But now, gracious Elector and Lord, that because of the reduction in salaries Chapelmaster Dousmoulin has already asked his demission or will soon do so, and I at the command of Baron Belderbusch am to begin _de novo_ to fill his office, and the same must surely be replaced,--Therefore

There reaches Your Electoral Grace my humble petition that you may graciously be pleased (: inasmuch as the “Toxal” must be sufficiently supplied with _musique_, and I must at all events take the lead in the occurring church ceremonies _in puncto_ the chorales:) to grant me the justice of which I was deprived on the death of Your Highness’s _antecessori_ of blessed memory, and appoint me chapelmaster with some augmentation of my lessened salary because of my services performed in _Duplo_. For which highest grace I shall pour out my prayers to God for the long continuing health and government of your Electoral Grace, while in

deepest submission I throw myself at your feet.

Your Electoral Grace's most humble servant Ludwig van Beethoven "Passist."

M. F. Whereas We, Maximilian Friedrich, Elector of Cologne, on the demission of our former chapelmaster Touche Moulin, and the humble petition of our bass singer Ludwig van Beethoven have appointed the latter to be chapelmaster with the retention of his position as bass singer, and have added 97 rthlr. _species_ 40 alb. to his former salary of 292 rthlr. _species_ 40 alb. per annum divided in _quartalien_, which appointment is hereby made and payment ordered by our grace, our exchequer and all whom it may concern are called on to observe the fact and do what is required under the circumstances.

Attest, etc.

Bonn, July 16, 1761.

Next in order, at an interval of rather more than a year, is the following short paper in reply to a petition, not preserved, of the new chapelmaster's son:

Supplicanten is hereby graciously assured that in the event of a _vacatur_ of a court musician's salary he shall have special consideration. Attest our gracious sign manual and the impress of the seal of the Privy Chancellary.

Bonn, November 27, 1762.

Max Fried. Elector. v. Belderbusch, (:L. S.:)

About December, 1763, a singer, Madame Lentner, after some four and a half years of service, threw up her appointment, giving occasion, through the vacancy thus caused, for the following petition, report and decrees:

Most Reverend Elector, Most Gracious Lord, Lord.

Will Your Electoral Grace deign to receive the representation that by the acceptance of service elsewhere of Court Musician Dauber there has fallen to the disposition of Your Reverend Electoral Grace a salary of 1,050 rth., wherefore I, Joannes van Beethoven, having graciously been permitted for a considerable time to serve as court musician and have been graciously assured by decree of appointment to the first vacancy, and have always faithfully and diligently performed my duties and graciously been permitted to be in good voice, therefore my prayer is made to Your Reverend and Electoral Grace for a grant of the aforesaid 1,050 rth. or a gracious portion thereof, which act of highest grace I shall try to merit by fidelity and zeal in the performance of my duties.

Your Reverend Electoral Grace's most obedient servant Joannes van Beethoven, vocalist.

This petition was seconded by the father in the following manner:

Most Reverend Archbishop and Elector, Most gracious Lord, Lord.

Your Electoral Grace having graciously been pleased to submit for my humble report the humble petition of Your Highness's court musician Joann Ries that his daughter be appointed to the place in the court music of Your Highness made vacant by the discharged soprano Lentner _sub Litt. A._

Humbly obeying Your gracious command I submit an impartial report that for about a year the daughter of the court musician Ries has frequented the "Duc sahl" (doxal) and sung the soprano part and that to my satisfaction.

But now that my son Joannes van Beethoven has already for 13 years sung soprano, contralto and tenor in every emergency that has arisen on the "Duc sahl," is also capable on the violin, wherefore Your Reverend Electoral Grace _27 Novembris 1762_ granted the accompanying decree graciously bearing your own high sign manual _sub Litt. B._

My humble and obedient but not anticipatory opinion is that the court singer Lentner's vacated salary _ad_ 300 fl. (: who went away without the gracious permission of Your Highness over a quarter of a year ago and reported to me _in specie_ she was going without permission and would not return:) be graciously divided so that my son be decreed to receive 200 florins and the daughter of Court Musician Ries 100 fl.

Zu Ewr. Churfürst. gnaden beständige hulden und gnaden mich unterthänigst erlassendt in tieffester submission ersterbe.

Your Reverend Electoral Grace's most humble and obedient Ludwig van Beethoven, Chapel Master.

JOHANN VAN BEETHOVEN'S SALARY

Increase of salary of 100 rthr. for Court Musician Beethoven.

M. F.

Whereas We, Maximilian Friedrich, Elector of Cologne, on the humble petition of our court musician Johann van Beethoven, have shown him the grace to allow him 100 rthr. out of the salary vacated by the departure of the singer Lentner to be paid annually in _quartalien_ we hereby confirm the allowance; for which this decree is graciously promulgated to be observed by our Electoral exchequer which is to govern itself accordingly.

Attest p. Bonn, April 24, 1764.

Under the same date a decree was issued appointing Anna Maria Ries, daughter of Johann Ries, Court Singer, with a salary of 100 th. also out of that of the Lentner. A few days later the following action was taken:

M. F. E.

To the Electoral Exchequer touching the appointment of Court Musician Beethoven and the Singer Ries.

You are hereby graciously informed that our court musician Bethoven junior and the singer Ries will soon lay before you two decrees of appointment. Now inasmuch as with this the salary of the former singer Lentner is disposed of but since she received an advance of 37-1/2 rth. from our Master of Revenues and 18 rth. _spec._ was paid to her creditors we graciously command you herewith so to arrange the payment of the two salaries that the advance from the Revenues and then the payment to the creditors be covered from the Lentner's salary; and that until this is done the salaries of the beforementioned Ries and Bethoven do not begin.

We etc. Bonn, April 27, 1764.

On April 3, 1778, Anna Maria Ries received an additional 100 fl. A few more documents lead us to the family of Johann Peter Salomon:

ad Supplicam Philip Salomon.

To inform our chapelmaster van Betthoven appointed on his humble petition that we are not minded to grant the letter prayed for to the Prince v. Sulkowsky, but in case his son is not returned by the beginning of the coming month 8bris, we are graciously determined to make disposition of his place and salary.

Attest. Münster, August 8, 1764. Sent, the 22 _dito_.

In spite of this order on July 1, 1765, the Elector gave a document to the son, Johann Peter Salomon, certifying that he had served him faithfully and diligently and had "so conducted himself as to deserve to be recommended to every one according to his station."[2] On petition of Philipp Salomon, the father, he and his daughter were appointed Court Musicians by decree dated August 11, 1764.

Several papers, dated April 26, 1768, although upon matters of very small importance, have a certain interest as being in part official communications from the pen of Chapelmaster van Beethoven, and illustrating in some measure his position and duties. They show, too, that his path was not always one bordered with roses. Being self-explanatory they require no comment:

I.

Most Reverend Archbishop and Elector, Most Gracious Lord, Lord.

Will Your Electoral Grace deign to listen to the complaint that when Court Singer Schwachhofer was commanded in obedience to an order of His Excellency Baron von Belderbusch to alternate with Jacobina Salomon in the singing of the solos in the church music as is the custom, the said Schwachhofer in the presence of the entire chapel impertinently and literally answered me as follows: I will not accept your _ordre_ and you have no right to command me.

Your Electoral Grace will doubtless recall various _disordre_ on the part of the court chapel indicating that all respect and _ordonance_ is withheld from me, each member behaving as he sees fit, which is very painful to my sensibilities.

Wherefore my humble prayer reaches Your Electoral Highness that the public affront of the Schwachhofer be punished to my deserved _satisfaction_ and that a decree issue from Your Highness to the entire chapel that at the cost of Your Gracious displeasure or punishment according to the offence my _ordre_ shall not be evaded.

Your Electoral Grace's Humble and Most Obedient Servant Ludovicus van Beethoven.

II.

To Chapelmaster van Beethoven Concerning the Court Musicians. M. F. E.

Receive the accompanying Command to the end that its contents be conveyed to all of our court musicians or be posted on the "toxal."

We remain, etc. Bonn, April 26, 1768.

III.

Command respecting the Court Musicians.

Having learned with displeasure that several of our court musicians have tried to evade the _ordre_ issued by our Chapel Master or refused to receive them from him, and conduct themselves improperly amongst themselves, all of our court musicians are hereby earnestly commanded without contradiction to obey all the commands given by our Chapel Master in our name, and bear peaceful relations with each other, since we are determined to proceed with rigor against the guilty to the extent of dismissal in certain cases.

Sig. Bonn, April 26, 1768.

JOHANN VAN BEETHOVEN NEEDS MORE MONEY

On November 17, 1769, Johann van Beethoven submits a petition in which he exhibits anew his genius for devising methods for varying the spelling of his own name. That he could no longer live on 100 th. salary is evident when it is remembered that he has now been married two years; but as there were several applicants for the salary which had fallen to the disposal of the Elector, it was divided among the four most needy. Beethoven's memorial contains a fact or two in regard to his duties as Court Musician which are new:

To His Electoral Grace of Cologne, etc., etc.

The Humble Supplication and Prayer of Johann Bethof, Court Musician.

Most Reverend Archbishop and Elector, Most Gracious Lord, Lord.

May Your Most Reverend Electoral Grace, graciously permit the presentation of this humble _supplicando_, how for many years I have served Your Highness faithfully and industriously on the "Duc saahl" and the theatre, and also have given instruction in various _supjecta_ concerning the aforesaid service to the entire satisfaction of Your Electoral Grace, and am engaged now in study to perfect myself to this end.

My father also joins in this _supplic_ in his humble capacity of the _theatri_ and will participate in the gladness should Your Electoral Grace graciously grant the favor; as it is impossible for me to live on the salary of 100 th. graciously allowed me, I pray Your Electoral Grace to bestow upon me the 100 th. left at Your gracious disposal by the death of Your court musician Philip Haveck; to merit this high grace by faithful and diligent service shall be my greatest striving.

Your Electoral Grace's most humble Joannes Bethof, Court Musician.

In answer to this there came the following decree:

Whereas we, Max. Frid. p. on the death of Court Musician Philipp Haveck and the submissive petition of our court musician Philipp Salomon bestowed upon him the grace of adding 50 fl. for his two daughters to the salary which he already enjoys out of the salary

of the above mentioned Haveck per year; we confirm the act hereby; wherefore we have graciously issued, this decree, which our Electoral Court Exchequer will humbly observe and make all necessary provisions.

Attest, p. Münster, 17th 9bris 1769.

(On the margin:) “Gracious addition of 50 fl. for the court musician Philipp Salomon” and, besides Brandt and Meuris, also “_in simili_ for Court Musician Joann Bethoff 25 fl.”

There need be no apology for filling a few more pages with extracts from documents found in the Düsseldorf archives; for now a period has been reached in which the child Ludwig van Beethoven is growing up into youth and early manhood, and thrown into constant contact with those whose names will appear. Some of these names will come up many years later in Vienna; others will have their parts to play in the narrative of that child’s life. Omitting, for the present, a petition of Johann van Beethoven, we begin them with that of Joseph Demmer, of date January 23, 1773, which first secured him his appointment after a year’s service and three months’ instruction from “the young Mr. van Beethoven.”

Most Reverend Archbishop and Elector, Most Gracious Lord, etc., etc.

I have been accepted as chorister in the cathedral of this city at a salary of 80 th. per year, and have so practised myself in music that I humbly flatter myself of my ability to perform my task with the highest satisfaction.

It being graciously known that the bass singer van Beethoven is incapacitated and can no longer serve as such, and the contra-bassist Noisten can not adapt his voice: therefore this my submissive to Your Reverend Electoral Grace that you graciously be pleased to accept me as your bass singer with such gracious salary as may seem fit; I offer should it be demanded to attend the operettas also and qualify myself in a short time. It depends upon a mere hint from Your Electoral Grace alone; that it shall not be burdensome to the cantor’s office of the cathedral to save the loss of the 80 th. yearly which it has bestowed upon me.

I am in most dutiful reverence Your Electoral Grace’s most obedient Joseph Demmer.

Pro Memoria.

Cantor Demmer earned at the utmost 106 rth. per year if he neglected none of the greater or little _Horis_.

Pays the Chamber Chancellor Kügelgen for board, annually, 66 rth. for _quartier_ (lodging) 12 rth.

moreover, he must find himself in clothes and washing since his father, the sub-sacristan in Cologne, is still overburdened with 6 children.

He has paid 6 rth. to young Mr. Beethoven for 3 months.

JOSEPH DEMMER SUCCEEDS BEETHOVEN

In response to another petition after the death of L. van Beethoven the following decree was issued:

Decree as Court vocal bass for Joseph Demmer.

Whereas His Electoral Grace of Cologne, M. F. our most gracious Lord, on the humble petition of Joseph Demmer has graciously appointed and accepted him as His Highness’s vocal bass on the Electoral Toxal, with a yearly salary of 200 fl. divided in _quartalien_ to begin with the current time, the appointment is confirmed hereby and a decree granted to the same Demmer, of which, for purposes of payment, the Electoral Chancellary will take notice and all whom it may concern will respect and obey the same and otherwise do what is necessary in the premises. Attest, p. Bonn, May 29, 1774.

Two years later leave of absence, but without salary, was granted to Joseph Demmer to visit Amsterdam to complete his education in music. Further notes from documentary sources:

1774. May 26. Andreas Lucchesi appointed Court Chapelmaster in place of Ludwig van Beethoven, deceased, with a salary of 1,000 fl.

May 29. Salary of Anna Maria Ries raised from 230 fl. to 300 fl. On May 13, 1775, together with Ferdinand Trewer (Drewer), violinist, she receives leave of absence for four months, to begin in June with two quarters’ pay in advance. In the Court Calendar for 1775, which was printed about seven months in advance, she is already described as Madame Drewers, née Ries. She was

considered the best singer in the chapel.

November 23. Franz Anton Ries has granted him 25 th. payable quarterly.

1775. March 23. Nicolas Simrock appointed on petition “Court Hornist on the Electoral Toxal, in the cabinet and at table,” and a salary of 300 fl. was granted April 1. This is the first appearance in these records of a name which afterwards rose into prominence.

1777. April 20. B. J. Mäurer, violoncellist, “who has served in the court chapel from the beginning of the year till now on a promise of 100 th.,” prays for an appointment as court ’cellist at a salary of 400 th. Appointed at a salary of 200 th.; we shall have occasion to recur to him presently in connection with notices touching Beethoven.

Under date May 22, 1778, J. van Beethoven informs the Elector that “the singer Averdonck, who is to be sent to Chapelmaster Sales at Coblenz, is to pay 15 fl. per month for board and lodging but that only a _douceur_ is to be asked for her instruction and that to take her thither will cost 20 th.” There followed upon this the following document:

To the humble announcement of Court Musician Beethoven touching the singer Averdonck.

Electoral Councillor Forlivesi is to pay to the proper authorities for a year beginning next month, 15 fl. a month and for the travelling expenses 20 rth. once and for all as soon as the journey is begun.

Attest. p. Bonn, May 22, 1778.

This pupil of Johann van Beethoven, Johanna Helena Averdonk, born in Bonn on December 11, 1760, and brought forward by her teacher at a concert in Cologne, received 120 th. “as a special grace” on July 2, and was appointed Court Singer on November 18, 1780, with a salary of 200 th. She died nine years later, August 13, 1789.

The petitions sent in to the Elector were rarely dated and were not always immediately attended to; therefore the date of a _decretum_ is not to be taken as conclusive in regard to the date of facts mentioned in a petition. An illustration is afforded by a petition of Franz Ries. He has returned from a tour to Vienna and prays for a salary of 500 fl. “not the half of what he can earn elsewhere.” The petition is dated March 2. Two months passing without bringing him an answer, he petitions again and obtains a decree on May 2 that in addition to his salary of 28 th. 2 alb. 6, he shall receive “annoch so viel,”--again as much,--i. e., 400 fl.

1780. August. Court Organist Van den Eede prays that in consideration of his service of 54 years he be graciously and charitably given the salary vacated by the death of Court Musician Salomon. Eighteen others make the same prayer. The decision of the privy council is in these words: “To be divided between Huttenus and Esch. A decree as musical vocalist must first be given to the latter.”

1781. February 15. The name of C. G. Neefe is now met with for the first time. He petitions for appointment to the position of organist in succession to Van den Eede, obviously aged and infirm. A decree was issued “_placet et expediatur_ on the death of Organist Van den Eede,” and a salary of 400 fl. granted.

1782. May 16. Johann van Beethoven petitions for “the three measures (_Malter_) of corn.”

The archives of Düsseldorf furnish little more during the time of Max Frederick save certain papers relating to the Beethoven family, which are reserved for another place.

OPERA AT THE ELECTOR’S COURT

The search for means to form some correct idea of the character of the musical performances at the Elector’s court during this reign has been more successful than for the preceding; but much is left to be desired down to the year 1778, when the theatre was placed upon a different basis and its history is sufficiently recorded. Such notices, however, in relation to the operatic entertainments as have been found scattered, mostly in the newspapers of Bonn, in those years, are numerous enough to give an idea of their character; while the remarks upon the festivities of the court, connected with them, afford a pretty lively picture of social amusement in the highest circle. We make room for some of the most significant occurrences, in chronological order:

1764. January 3. Galuppi’s opera “Il Filosofo di Campagna,” given in the Electoral Theatre with great applause.

January 8. A grand assembly at the palace in the afternoon, a magnificent supper in the grand gallery at which many spectators were present, and finally a masked ball.

March 23. Second performance of “La buona Figliuola,” music by Piccini.

May 13. Elector's birthday; "Le Nozze," music by Galuppi, and two ballets.

May 20. "II Filosofo" again, the notice of which is followed by the remark that the Elector is about removing to Brühl for the summer but will visit Bonn twice a week "on the days when operas are performed."

September 21. "La Pastorella al Soglio" (composer not named, probably Latilla), and two ballets.

December 16. "La Calamità di cuori," by Galuppi, and two ballets. This was "the first performance by the Mingotti company under the direction of Rizzi and Romanini."

1765. January 6. "Le Aventure di Rodolfo" (Piccini?), given by the same company together with a pantomime, "L'Arlequino fortunato per la Maggia." After the play there was a grand supper at which the Pope's nuncio was a guest, and finally a masked ball kept up till 6 o'clock in the morning.

1767. May 13. The Archbishop's birthday. Here is the programme condensed from the long description of the festivities in the "Bonnischer Anzeiger": 1, Early in the morning three rounds from the cannon on the city walls; 2, The court and public graciously permitted to kiss His Transparency's hand; 3, solemn high mass with salvos of artillery; 4, Grand dinner in public, the pope's nuncio, the foreign ministers and the nobility being the guests and the eating being accompanied by "exquisite table-music"; 5, After dinner "a numerously attended assembly"; 6, "A serenata composed especially for this most joyful day" and a comic opera in the palace theatre; 7, Supper of 130 covers; 8, _Bal masqué_ until 5 a. m. The two dramatic pieces were "Serenata festivale, tra Bacco, Diana ed il Reno," the authors unnamed, and "Schiava finta," _drama giocoso dal celebre don Francesco Garzia_, _Spagnuolo_, the music probably by Piccini; "Giovanni van Beethoven" sang the part of _Dorindo_.

1768. May 16. "On the stage of the Court Theatre was performed with much applause a musical poem in German, specially written for the birthday of His Highness, and afterward an Italian intermezzo entitled 'La Nobiltà delusa.'"

1769. The festivities in honor of the birthday of the Elector took place May 17th, when, according to the "Anzeiger," "an Italian musical drama written expressly for this occasion was performed"--but the title suggests the possibility of a mistake; "II Riso d'Apolline," with music by Betz, had been heard in 1701.

1771. A single discovery only for this year has rewarded search, that of a text-book, one of particular interest: "Silvain," comédie en une acte, mélée d'ariettes, représentée, etc. Text by Marmontel, music by Grétry. _Dolmon père_, Mons. Louis van Beethoven, _Maître de Chapelle_; _Dolmon, fils ainé_, Jean van Beethoven, etc.

1772. February 27. "Le Donne sempre Donne," music by Andreas Lucchesi.

In March, on occasion of the opening of the Estates, "La Contadine in Corte," music by Sacchini.

The pieces given on the birthday this year were "Il Natal di Giove," music by Lucchesi, and "La buona Figliuola," music by Piccini. On the 17th the latter was repeated on the arrival of the French ambassador.

1773. May 30. The Elector's birthday; "L'Inganno scoperto, overo il Conte Caramella," music by Lucchesi, in which Ludovico van Beethoven sang the part of _Brunoro, contadino e tamburino_.

VERSATILITY OF THE COURT MUSICIANS

There are three more operettas which evidently belong to the succeeding winter when the Bonn company had the aid of two singers from the electoral court of Trèves. Their titles are "L'Improvvisata, o sia la Galanteria disturbata," by Lucchesi, "Li tre Amanti ridicoli," by Galuppi, and "La Moda," by Baroni. Ludwig van Beethoven did not sing in them. The means are still wanting to fill up the many gaps in the annals of this period or to carry them on during the next three years. Perhaps, however, the loss is not of much importance, for the materials collected are sufficient to warrant certain conclusions in regard to the general character of the court music. The musicians, both vocal and instrumental, were employed in the church, concert-room and theatre; their number remained without material change from the days of Christopher Petz to the close of Chapelmaster van Beethoven's life; places in this service were held to be a sort of heritage, and of right due to the children of old incumbents, when possessed of sufficient musical talent and knowledge; few if any names of distinguished virtuosos are found in the lists of the members, and, in all probability, the performances never rose above the respectable mediocrity of a small band used to playing together in the light and pleasing music of the day.

The dramatic performances appear to have been confined to the operetta; and the vocalists, who sang the Latin of the mass, seem to have been required to be equally at home in German, Italian and French in the theatre. Two visits of the Angelo Mingotti troupe are noted; and one attempt, at least, to place the opera upon a higher basis by the engagement of Italian songstresses, was evidently made in the time of Clemens August.; it may be concluded that no great improvement was made--it is certain that no permanent one was; for in the other case the Bonn theatrical revolution of 1778 had not been needed. This must be noticed in detail.

Chronologically the following sketch belongs to the biography of Ludwig van Beethoven, as it embraces a period which happens in his case to be of special interest, young as he was;--the period from his 8th to his 14th year. But the details given, though of great importance for the light which they throw upon the musical life in which he moved and acted, would hardly be of so much interest to most readers as to justify breaking with them the course of the future narrative.

It was a period of great awakening in theatrical matters. Princes and courts were beginning everywhere in Germany to patronize the drama of their mother tongue and the labors of Lessing, Gotter and other well-known names, in the original production of German, or in the translation of the best English, Italian and French plays, were justifying and giving ever new impulse to the change in taste. From the many itinerant troupes of players performing in booths, or, in the larger cities, in the play-houses, the better class of actors were slowly finding their way into permanent companies engaged and supported by the governments. True, many of the newly established court theatres had but a short and not always a very merry life; true, also, that the more common plan was merely to afford aid and protection to some itinerant troupe; still the idea of a permanent national theatre on the footing of the already long-existing court musical establishments had made way, and had already been carried out in various places before it was taken up by the elector at Bonn. It can hardly be supposed that the example of the imperial court at Vienna, with the immense means at its disposal, could exert any direct influence upon the small court at Bonn at the other extremity of Germany; but what the Duke of Gotha and the elector at Mannheim had undertaken in this direction, Max Friedrich may well have ventured and determined to imitate. But there was an example nearer home--in fact in his own capital of Münster, where he, the prince primate, usually spent the summer. In 1775, Dobbler's troupe, which had been for some time playing in that city, was broken up.

The Westhus brothers in Münster built up their own out of the ruins; but it endured only a short time. Thereupon, under the care of the minister, H. von Fürstenberg (one of those rare men whom heaven elects and equips with all necessary gifts to cultivate what is good and beautiful in the arts), a meeting of the lovers of the stage was arranged in May and a few gentlemen of the nobility and a few from the parterre formed a council which assumed the direction. The Elector makes a considerable contribution. The money otherwise received is to be applied to the improvement of the wardrobe and the theatre. The actors receive their honoraria every month.[3]

OPERA AND DRAMA AT BONN IN 1779

At Easter, 1777, Seyler, a manager famous in German theatrical annals, and then at Dresden, finding himself unable to compete with his rival, Bondini, left that city with his company to try his fortunes in Frankfort-on-the-Main, Mayence, and other cities in that quarter. The company was very large--the Theatre Lexicon (Article "Mainz") makes it, including its orchestra, amount to 230 individuals!--much too large, it seems, in spite of the assertion of the Theatre Lexicon, to be profitable. Be that as it may, after an experience of a year or more, two of the leading members, Grossmann and Helmuth, accepted an engagement from Max Friedrich to form and manage a company at Bonn in order that "the German art of acting might be raised to a school of morals and manners for his people." Taking with them a pretty large portion of Seyler's company, including several of the best members, the managers reached Bonn and were ready upon the Elector's return from Münster to open a season. "The opening of the theatre took place," says the Bonn "Dramaturgische Nachrichten," "on the 26th of November, 1778, with a prologue spoken by Madame Grossmann, 'Wilhelmine Blondheim,' tragedy in three acts by Grossmann, and 'Die grosse Batterie,' comedy in one act by Ayrenhofer." The same authority gives a list of all the performances of the season, which extended to the 30th of May, 1779, together with débuts, the dismissals and other matters pertaining to the actors. The number of the evenings on which the theatre was open was 50. A five-act play, as a rule, occupied the whole performance, but of shorter pieces usually two were given; and thus an opening was found occasionally for an operetta. Of musical dramas only seven came upon the stage and these somewhat of the lightest order except the first--the melodrama "Ariadne auf Naxos," music by Benda. The others were:

1779. February 21. "Julie," translated from the French by Grossmann, music by Desaides.

February 28. "Die Jäger und das Waldmädchen," operetta in one act, music by Duni.

March 21. “Der Hofschmied,” in two acts, music by Philidor.

April 9. “Röschen und Colas,” in one act, music by Monsigny.

May 5. “Der Fassbinder,” in one act, music by Oudinot.

May 14. A prologue “Dedicated to the Birthday Festivities of His Electoral Grace of Cologne, May 13, 1779, by J. A. Freyherrn vom Hagen.”

The selection of dramas was, on the whole, very creditable to the taste of the managers. Five of Lessing’s works, among them “Minna von Barnhelm” and “Emilia Galotti,” are in the list and some of the best productions of Bock, Gotter, Engel and their contemporaries; of translations there were Colman’s “Clandestine Marriage” and “Jealous Wife,” Garrick’s “Miss in her Teens,” Cumberland’s “West Indian,” Hoadly’s “Suspicious Husband,” Voltaire’s “Zaire” and “Jeannette,” Beaumarchais’s “Eugénie,” two or three of the works of Molière, and Goldoni, etc.;--in short, the list presents much variety and excellence.

Max Friedrich was evidently pleased with the company, for the “Nachrichten” has the following in the catalogue of performances: “On the 8th (of April) His Electoral Grace was pleased to give a splendid breakfast to the entire company in the theatre.... The company will occupy itself until the return of His Electoral Grace from Münster, which will be in the middle of November, with learning the newest and best pieces, among which are ‘Hamlet,’ ‘King Lear’ and ‘Macbeth,’ which are to be given also with much splendor of costume according to the designs of famous artists.”

It may be remarked here that the “Bonn Comedy House” (for painting the interior of which Clemens August paid 468 thalers in 1751, a date which seems to fix the time at which that end of the palace was completed), occupied that portion of the present University Archæological Museum room next the Coblenz Gate, with large doors opening from the stage into the passageway so that this space could be used as an extension of the stage in pieces requiring it for the production of grand scenic effects. Above the theatre was the “Redouten-Saal” of Max Franz’s time. The Elector had, of course, an entrance from the passages of the palace into his box. The door for the public, in an angle of the wall now built up, opened out upon the grove of horse-chestnuts. The auditorium was necessarily low, but spacious enough for several hundred spectators. Though much criticized by travellers as being unworthy so elegant a court, not to say shabby, it seems to have been a nice and snug little theatre.

Meanwhile affairs with Seyler were drawing to a crisis. He had returned with his company from Mannheim and reopened at Frankfort, August 3, 1779. On the evening of the 17th, to escape imprisonment as a bankrupt, whether through his own fault or that of another--the Theatre Lexicon affirms the latter case--he took his wife and fled to Mayence. The company was allowed by the magistrates to play a few weeks with a view of earning at least the means of leaving the city; but on October 4, its members began to separate; Benda and his wife went to Berlin, but C. G. Neefe, the music director, and Opitz, descended the Rhine to Bonn and joined the company there--Neefe assuming temporarily the direction of the music in the theatre--of which more in another place.

No record has been found of the repertory of the Bonn theatre for the season 1779-1780, except that the opening piece on December 3, on the evening after the Elector’s return from Münster, was a prologue, “Wir haben Ihn wieder!” text by Baron vom Hagen, with airs, recitatives and choruses composed by Neefe; that the “Déserteur” was in the list, and finally Hiller’s “Jagd.” In June, 1781, the season being over, the company migrated to Pyrmont, from Pyrmont to Cassel, and thence, in October, back to Bonn.

ANOTHER BUSY SEASON AT BONN

The season of 1781-’82 was a busy one; of musical dramas alone 17 are reported as newly rehearsed from September, 1781, to the same time in 1782, viz:

“Die Liebe unter den Handwerkern” (“L’Amore Artigiano”) Music by Gassmann “Robert und Calliste” „ „ Guglielmi “Der Alchymist” „ „ Schuster. “Das tartarische Gesetz” „ „ d’Antoine (of Bonn) “Der eifersüchtige Liebhaber” (“L’Amant jaloux”) „ „ Grétry “Der Hausfreund” (“L’Ami de la Maison”) „ „ Grétry “Die Freundschaft auf der Probe” (“L’Amitié à l’Épreuve”) „ „ Grétry “Heinrich und Lyda” „ „ Neefe “Die Apotheke” „ „ Neefe “Eigensinn und Launen der Liebe” „ „ Deler (Teller, Deller?) “Romeo und Julie” „ „ Benda “Sophonisba” (Deklamation mit Musik) „ „ Neefe “Lucille” „ „ Grétry “Milton und Elmire” „ „ Mihl (or Mühle) “Die Samnitische Vermählungsfeier” (“Le Marriage des Samnites”) „ „ Grétry “Ernst und Lucinde” „ „ Grétry “Günther von Schwarzburg” „ „ Holzbauer

It does not follow, however, that all these operas, operettas and plays with music were produced during the season in Bonn. The company followed the Elector to Münster in June, 1782, and removed thence to Frankfort-on-the-Main for its regular series of

performances at Michaelmas. It came back to Bonn in the Autumn.

The season 1782-'83 was as active as the preceding. Some of the newly rehearsed spoken dramas were "Sir John Falstaff," from the English, translations of Sheridan's "School for Scandal," Shakespeare's "Lear," and "Richard III," Mrs. Cowley's "Who's the Dupe?" and, of original German plays, Schiller's "Fiesco" and "Die Räuber," Lessing's "Miss Sara Sampson," Schroeder's "Testament," etc., etc. The number of newly rehearsed musical dramas--in which class are included such ballad operas as General Burgoyne's "Maid of the Oaks"--reached twenty, viz:

"Das Rosenfest" Music by Wolf (of Weimar) "Azalia" „ „ Johann Küchler (Bassoonist in the Bonn chapel) "Die Sklavin" (_La Schiava_) „ „ Piccini "Zémire et Azor" „ „ Grétry "Das Mädchen im Eichthale" ("Maid of the Oaks") „ „ d'Antoine (Captain in the army of the Elector of Cologne) "Der Kaufmann von Smyrna" „ „ J. A. Juste (Court Musician in The Hague) "Die seidenen Schuhe" „ „ Alexander Frizer (or Fridzeri) "Die Reue vor der That" „ „ Desaides "Der Aerndtetanz" „ „ J. A. Hiller "Die Olympischen Spiele" (_Olympiade_) „ „ Sacchini "Die Lügnerin aus Liebe" „ „ Salieri "Die Italienerin zu London" „ „ Cimarosa "Das gute Mädchen" (_La buona figliuola_) „ „ Piccini "Der Antiquitäten-Sammler" „ „ André "Die Entführung aus dem Serail" „ „ Mozart "Die Eifersucht auf der Probe" (_Il Geloso in Cimento_) „ „ Anfossi "Rangstreit und Eifersucht auf dem Lande" (_Le Gelosie villane_) „ „ Sarti "Unverhofft kommt oft" (_Les Évènements imprévus_) „ „ Grétry "Felix, oder der Findling" (_Félix ou l'Enfant trouvé_) „ „ Monsigny "Die Pilgrimme von Mekka" „ „ Gluck

But a still farther provision has been made for the Elector's amusement during the season of 1783-'84, by the engagement of a ballet corps of eighteen persons. The titles of five newly rehearsed ballets are given in the report from which the above particulars are taken, and which may be found in the theatrical calendar for 1784.

With an enlarged company and a more extensive repertory, preparations were made for opening the theatre upon the Elector's return, at the end of October, from Münster to Bonn. But the relations of the company to the court have been changed. Let the "Theater-Kalender" describe the new position in which the stage at Bonn was placed:

Bonn. His Electoral Grace, by a special condescension, had graciously determined to make the theatrical performances gratuitous and to that end has closed a contract with His Highness's Theatrical Director Grossmann according to which besides the theatre free of rent, the illumination and the orchestra he is to receive an annual subvention for the maintenance of the company. On His Highness's command there will be two or three performances weekly. By particular grace the director is permitted to spend several summer months in other places.

AN INFLUENCE ON THE BOY BEETHOVEN

The advantages of this plan for securing a good repertory, a good company and a zealous striving for improvement are obvious; and its practical working during this, its only, season, so far as can now be gathered from scanty records, was a great success. It will hereafter be seen that the boy Ludwig van Beethoven was often employed at the pianoforte at the rehearsals--possibly also at the performances of the company of which Neefe was the musical director. That a company consisting almost exclusively of performers who had passed the ordeal of frequent appearance on the stage and had been selected with full knowledge of the capacity of each, and which, moreover, had gained so much success at the Bonn court as to be put upon a permanent footing, must have been one of more than the ordinary, average excellence, at least in light opera, needs no argument. Nor need comments be made upon the influence which daily intercourse with it, and sharing in its labors, especially in the direction of opera, must have exerted upon the mind of a boy of twelve or thirteen years possessed of real musical genius.

The theatrical season, and with it the company, came to an untimely end. Belderbusch died in January, 1784. Madame Grossmann died in childbed on March 28, and on April 15 the Elector followed them to another world. After the death of the Elector Maximilian Friedrich the Court Theatre was closed for the official mourning and the company dismissed with four weeks' salary.

It is consonant to the plan of this introductory chapter that some space be devoted to sketches of some of the principal men whose names have already occurred and to some notes upon the musical amateurs of Bonn who are known, or may be supposed, to have been friends of the boy Beethoven. These notices make no claim to the credit of being the result of original research; they are, except that of Neefe, little more than extracts from a letter, dated March 2, 1783, written by Neefe and printed in Cramer's "Magazin der Musik" (Vol. I, pp. 337 _et seq._). At that time the "Capelldirector," as Neefe calls him, was Cajetano Mattioli, born at Venice, August 7, 1750, whose appointments were concertmaster and musical director in Bonn, made on May 26, 1774 and April 24, 1777.

He studied in Parma, says Neefe, with the first violinist Angelo Moriggi, a pupil of Tartini, and in Parma, Mantua and Bologna conducted grand operas like “Orfeo,” “Alceste,” etc., by the Chevalier Gluck with success. He owed much to the example set by Gluck in the matter of conducting. It must be admitted that he is a man full of fire, of lively temperament and fine feeling. He penetrates quickly into the intentions of a composer and knows how to convey them promptly and clearly to the entire orchestra. He was the first to introduce accentuation, instrumental declamation, careful attention to forte and piano, or all the degrees of light and shade in the orchestra of this place. In none of the qualifications of a leader is he second to the famed Cannabich of Mannheim. He surpasses him in musical enthusiasm, and, like him, insists upon discipline and order. Through his efforts the musical repertory of this court has been provided with a very considerable collection of good and admirable compositions, symphonies, masses and other works, to which he makes daily additions; in the same manner he is continually striving for the betterment of the orchestra. Just now he is engaged in a project for building a new organ for the court chapel. The former organ, a magnificent instrument, became a prey of the flames at the great conflagration in the palace in 1777. His salary is 1,000 fl.

The chapelmaster (appointed May 26, 1774) was Mr. Andrea Lucchesi, born May 28, 1741, at Motta in Venetian territory. His teachers in composition were, in the theatre style, Mr. Cocchi of Naples; in the church style, Father Paolucci, a pupil of Padre Martini at Bologna, and afterwards Mr. Seratelli, Chapelmaster of the Duke of Venice. He is a good organist and occupied himself profitably with the instrument in Italy. He came here with Mr. Mattioli as conductor of an Italian opera company in 1771. Taken altogether he is a light, pleasing and gay composer whose part-writing is cleaner than that of most of his countrymen. In his church-works he does not confine himself to the strict style affected by many to please amateurs. Neefe enumerates Lucchesi’s compositions as follows: 9 works for the theatre, among them the opera “L’Isola della Fortuna” (1765), “Il Marito geloso” (1766), “Le Donne sempre Donne,” “Il Matrimonio per astuzia” (1771) for Venice, and the two composed at Bonn, “Il Natal di Giove” and “L’inganno scoperto,” various intermezzi and cantatas; various masses, vespers and other compositions for the church; six sonatas for the pianoforte and violin; a pianoforte trio, four pianoforte quartets and several pianoforte concertos. His salary was 1,000 fl.

CHRISTIAN GOTTLOB NEEFE’S CAREER

The organist of the Court Chapel was Christian Gottlob Neefe, son of a poor tailor of Chemnitz in Saxony, where he was born February 5, 1748. He is one of the many instances in musical history in which the career of the man is determined by the beauty of his voice in childhood. At a very early age he became a chorister in the principal church, which position gave him the best school and musical instruction that the small city afforded--advantages so wisely improved as to enable him in early youth to gain a living by teaching. At the age of 21, with 20 thalers in his pocket and a stipend of 30 thalers per annum from the magistrates of Chemnitz, he removed to Leipsic to attend the lectures of the university, and at that institution in the course of time he passed his examination in jurisprudence. Upon this occasion he argued the negative of the question: “Has a father the right to disinherit a son for devoting himself to the theatre?” In Chemnitz Neefe’s teachers in music had been men of small talents and very limited acquirements, and even in Leipsic he owed more to his persevering study of the theoretical works of Marpurg and C. P. E. Bach than to any regular instructor. But there he had the very great advantage of forming an intimate acquaintance with, and becoming an object of special interest to, Johann Adam Hiller, the celebrated director of the Gewandhaus Concerts, the then popular and famous composer, the introducer of Handel’s “Messiah” to the German public, the industrious writer upon music, and finally a successor of Johann Sebastian Bach as Cantor of the Thomas School. Hiller gave him every encouragement in his power in his musical career; opened the columns of his musical “Wöchentliche Nachrichten” to his compositions and writings; called him to his assistance in operatic composition; gave him the results of his long experience in friendly advice; criticized his compositions, and at length, in 1777, gave him his own position as music director of Seyler’s theatrical company, then playing at the Linkische Bad in Dresden. Upon the departure of that troupe for Frankfort-on-the-Main, Neefe was persuaded to remain with it in the same capacity. He thus became acquainted with Fräulein Zinck, previously court singer at Gotha but now engaged for Seyler’s opera. The acquaintance ripened into a mutual affection and ended in marriage not long afterward. It is no slight testimony to the high reputation which he enjoyed that at the moment of Seyler’s flight from Frankfort (1779) Bondini, whose success had driven that rival from Dresden, was in correspondence with Neefe and making him proposals to resign his position under Seyler for a similar but better one in his service. Pending the result of these negotiations Neefe, taking his wife with him, temporarily joined Grossmann and Helmuth at Bonn in the same capacity. Those managers, who knew the value of his services from their previous experience as members of the Seyler troupe, paid a very strong, though involuntary, tribute to his talents and personal character by adopting such unfair measures as to compel the musician to remain in Bonn until Bondini was forced to fill his vacancy by another candidate. Having once got him, Grossmann was determined to keep him--and succeeded.

As long as the Grossmann company remained undivided Neefe accompanied it in its annual visits to Münster and other places;--thus the sketch of his life printed sixteen years later in the first volume of the “Allgemeine Musikzeitung” of Leipsic bears date “Frankfort-on-the-Main, September 30, 1782”; but from that period save, perhaps, for a short time in 1783, he seems not to have left Bonn at all.

There were others besides Grossmann and Helmuth who thought Neefe too valuable an acquisition to the musical circles of Bonn not to be secured. Less than a year and a half after his arrival there the minister Belderbusch and the countess Hatzfeld, niece of the Elector, secured to him, though a Protestant, an appointment to the place of court organist. The salary of 400 florins, together with the 700 florins from Grossmann, made his income equal to that of the court chapelmaster. It is difficult now to conceive of the forgotten name of C. G. Neefe as having once stood high in the list of the first North German composers; yet such was the case. Of Neefe’s published compositions, besides the short vocal and clavier pieces in Hiller’s periodical, there had already appeared operettas in vocal score, “Die Apotheke” (1772), “Amor’s Guckkasten” (1772), “Die Einsprüche” (1773) and “Heinrich und Lyda” (1777); also airs composed for Hiller’s “Dorf-Barbier” and one from his own republished opera “Zemire und Azor”; twelve odes of Klopstock--sharply criticized by Forkel in his “Musikalisch-Kritische Bibliothek,” much to the benefit of the second edition of them; and a pretty long series of songs. Of instrumental music he had printed twenty-four sonatas for pianoforte solo or with violin; and from Breitkopf and Härtel’s catalogues, 1772 and 1774, may be added the following works included neither in his own list nor that of Gerber: a partita for string quartet, 2 horns, 2 oboes, 2 flutes and 2 bassoons; another for the same instruments minus the flutes and bassoons; a third for the string quartet and 2 oboes only, and two symphonies for string quartet, 2 horns, 2 oboes and 2 flutes. The “Sophonisbe” music was also finished and twenty years later, after Mozart had given a new standard of criticism, it was warmly eulogized in the “Allgemeine Musikzeitung” of Leipsic. At the date of his letter to Cramer (March 2, 1783) he had added to his published works “Sechs Sonaten am Clavier zu singen,” “Vademecum für Liebhaber des Gesangs und Clavier,” the clavier score of “Sophonisbe,” and a concerto for clavier and orchestra. His manuscripts, he adds (Cramer’s “Magazine,” I; p. 382), consist of (a) the scores of the operettas which had appeared in pianoforte arrangements; (b) the score of his opera “Zemire und Azor”; (c) the score of his opera “Adelheit von Veltheim”; (d) the score of a bardic song for the tragedy “The Romans in Germany”; (e) the scores of theatrical between-acts music; (f) the score of a Latin “Pater noster”; (g) various other smaller works. He had in hand the composition of the operetta “Der neue Gutsherr,” the pianoforte score of which, as also that of “Adelheit von Veltheim,” was about to be published by Dyck in Leipsic. A year before at a concert for amateurs at the house of Mr. von Mastiaux he had produced an ode by Klopstock, “Dem Unendlichen,” for four chorus voices and a large orchestra, which was afterwards performed in Holy Week in the _Fräuleinstiftskirche_. In short, Neefe brought to Bonn a high-sounding reputation, talent, skill and culture both musical and literary, which made him invaluable to the managers when new French and Italian operas were to be prepared for the German stage; great facility in throwing off a new air, song, _entr’acte_ or what not to meet the exigencies of the moment; very great industry, a _cacoethes scribendi_ of the very highest value to the student of Bonn’s musical history in his time and a new element into the musical life there. This element may have seemed somewhat formal and pedantic, but it was solid, for it was drawn from the school of Handel and Bach.

MUSIC IN PRIVATE HOUSES OF BONN

Let us return to Neefe’s letter to Cramer again for some notices of music outside the electoral palace:

Belderbusch, the minister, retained a quintet of wind-instruments, 2 clarinets, 2 horns and a bassoon.

The Countess von Belderbusch, wife of a nephew of the minister, whose name will come up again, “plays skilfully upon the clavier.”

The Countess von Hatzfeld, niece of the Elector, was “trained in singing and clavier playing by the best masters of Vienna to whom, indeed, she does very much honor. She declaims recitatives admirably and it is a pleasure to listen to her sing arias _di parlante_. She plays the fortepiano brilliantly and in playing yields herself up completely to her emotions, wherefore one never hears any restlessness or uneveness of time in her _tempo rubato_. She is enthusiastically devoted to music and musicians.”[4]

Chancellor and Captain von Schall “plays clavier and violin. Though not adept on either instrument he has very correct musical feeling. He knows how to appreciate the true beauties of a composition, and how to judge them, and has large historical and literary knowledge of music.”

Frau Court Councillor von Belzer “plays the clavier and sings. She has a strong, masculine contralto of wide range, particularly downwards.”

Johann Gottfried von Mastiaux, of the Finance Department and incumbent of divers high offices, is a self-taught musician. He plays several instruments himself and has given his four sons and a daughter the best musical instruction possible in Bonn. All are pianists and so many of them performers on other instruments that the production of quintets is a common family enjoyment. He is a devoted admirer of Haydn, with whom he corresponds, and in his large collection of music there are already 80 symphonies, 30 quartets and 40 trios by that master. His rare and valuable instruments are so numerous “that he could almost equip a complete orchestra. Every musician is his friend and welcome to him.”

Count Altstädter: “in his house one may at times hear a very good quartet.”

Captain Dantoine, “a passionate admirer and knower of music; plays the violin and the clavier a little. He learned composition from the books of Marpurg, Kirnberger and Riepel. Formed his taste in Italy. In both respects the reading of scores by classical masters has been of great service to him.” Among his compositions are several operettas, symphonies and quartets “in Haydn’s style.”

The three Messrs. Facius, “sons of the Russian agent here, are soundly musical; the two elder play the flute and the youngest plays the violoncello.” (According to Fischer the members of this family were visitors at the house of the Beethovens.)

There are many more music-lovers here, but the majority of them are too much given to privacy, so far as their musical practice goes, to be mentioned here. Enough has been said to show that a stranger fond of music need never leave Bonn without nourishment. Nevertheless, a large public concert institution under the patronage of His Electoral Grace is still desirable. It would be one more ornament of the capital and a promoter of the good cause of music.

What with the theatre, the court music, the musical productions in the church and such opportunities in private it is plain that young talent in those days in Bonn was in no danger of starvation for want of what Neefe calls “musikalische Nahrung.”

So much upon the _dramatis personæ_, other than the principal figure and his family. Let an attempt follow to describe the little city as it appeared in 1770--in other words, to picture the scene. By an enumeration made in 1789, the population of Bonn was 9,560 souls, a number which probably for a long series of years had rarely varied beyond a few score, more or less--one, therefore, that must very nearly represent the aggregate in 1770. For the town had neither manufactures nor commerce beyond what its own wants supported; it was simply the residence of the Elector--the seat of the court, and the people depended more or less directly upon that court for subsistence--as a wag expressed it, “all Bonn was fed from the Elector’s kitchen.” The old city walls--(the “gar gute Fortification, dass der Churfürst sicher genug darinnen Hof halten kann” of Johann Hübner’s description)--were already partially destroyed. Within them the whole population seems to have lived. Outside the city gates it does not appear that, save by a chapel or two, the eye was impeded in its sweep across gardens and open fields to the surrounding villages which, then as now hidden in clusters of walnut and fruit trees, appeared, when looked upon from the neighboring hills, like islands rising upon the level surface of the plain. The great increase of wealth and population during the last 150 years in all this part of the Rhine valley under the influence of the wise national economy of the Prussian government, has produced corresponding changes in and about the towns and villages; but the grand features of the landscape are unchanged; the ruins upon the Drachenfels and Godesberg looked down, as now, upon the distant roofs and spires of Bonn; the castle of Siegburg rose above the plains away to the East; the chapel crowned the Petersberg, the church with the marble stairs the nearer Kreuzberg.

A PROSPECT OF BONN IN BEETHOVEN’S DAY

The fine landing place with its growing trees and seats for idlers, the villas, hotels, coffee-houses and dwellings outside the old walls, are all recent; but the huge ferryboat, the “flying bridge,” even then was ever swinging like a pendulum from shore to shore. Steam as a locomotive power was unknown, and the commerce of the Rhine floated by the town, gliding down with the current on rafts or in clumsy but rather picturesque boats, or impelled against the stream by the winds, by horses and even by men and women. The amount of traffic was not, however, too great to be amply provided for in this manner; for population was kept down by war, by the hard and rude life of the peasant class, and by the influences of all the false national-economic principles of that age, which restrained commerce by every device that could be made to yield present profit to the rulers of the Rhine lands. Passengers had, for generations, no longer been plundered by mail-clad robbers dwelling upon a hundred picturesque heights; but each petty state had gained from the Emperor’s weakness “vested rights” in all sorts of custom-levies and taxes. Risbeck (1780) found nine toll-stations between Mayence and Coblenz; and thence to the boundary of Holland, he declares there were at least sixteen, and that in the average each must have collected 30,000 Rhenish florins per annum.

To the stranger, coming down from Mayence, with its narrow dark lanes, or up from Cologne, whose confined and pestiferously dirty streets, emitting unnamed stenches, were but typical of the bigotry, superstition and moral filth of the population--all now happily changed, thanks to a long period of French and Prussian rule--little Bonn seemed a very picture of neatness and comfort. Even its ecclesiastical life seemed of another order. The men of high rank in the church were of high rank also by birth; they were men of the world and gentlemen; their manners were polished and their minds enlarged by intercourse with the world and with gentlemen; they were tolerant in their opinions and liberal in their views. Ecclesiastics of high and low degree were met at every corner as in other cities of the Rhine region; but absence of military men was a remarkable feature. Johann Hübner gives the reason for this in few and quaint words:--"In times of war much depends upon who is master of Bonn, because traffic on the Rhine can be blockaded at this pass. Therefore the place has its excellent fortification which enables the Elector to hold his court in ample security within its walls. But he need not maintain a garrison there in time of peace, and in time of war troops are garrisoned who have taken the oath to the Emperor and the empire. This was settled by the peace of Ryswick as well as Rastatt."

While the improvement in the appearance of the streets of Bonn has necessarily been great, through the refitting or rebuilding of a large portion of the dwelling-houses, the plan of the town, except in those parts lying near the wall, has undergone no essential change, the principal one being the open spaces, where in 1770 churches stood. On the small triangular Römer-Platz was the principal parish church of Bonn, that of St. Remigius, standing in such a position that its tall tower looked directly down the Acherstrasse. In 1800 this tower was set on fire by lightning and destroyed; six years later the church itself was demolished by the French and its stones removed to become a part of the fortifications at Wesel. On the small, round grass plot as one goes from the Münster church toward the neighboring city gate (Neuthor) stood another parish church--a rotunda in form--that of St. Martin, which fell in 1812 and was removed; and at the opposite end of the minster, separated from it only by a narrow passage, was still a third, the small structure dedicated to St. Gangolph. This, too, was pulled down in 1806. Only the fourth parish church, that of St. Peter in Dietkirchen, is still in existence and was, at a later date, considerably enlarged. After the demolition of these buildings a new division of the town into parishes was made (1806).

The city front of the electoral palace, now the university, was more imposing than now, and was adorned by a tall, handsome tower containing a carillon, with bells numerous enough to play, for instance, the overture to Monsigny's "Deserter." This part of the palace, with the tower and chapel, was destroyed by fire in 1777.

The town hall, erected by Clemens August, and the other churches were as now, but the large edifice facing the university library and museum of casts, now occupied by private dwellings and shops, was then the cloister and church of the Franciscan monks. A convent of Capuchin nuns stood upon the Kesselgasse; its garden is now a bleaching ground.

HOLIDAY TIMES IN THE LITTLE CITY

Let the fancy picture, upon a fine Easter or Pentecost morning in those years, the little city in its holiday attire and bustle. The bells in palace and church tower ringing; the peasants in coarse but picturesque garments, the women abounding in bright colors, come in from the surrounding villages, fill the market-place and crowd the churches at the early masses. The nobles and gentry--in broad-flapped coats, wide waistcoats and knee-breeches, the entire dress often of brilliant colored silks, satins and velvets, huge, white, flowing neckcloths, ruffles over the hands, buckles of silver or even of gold at the knees and upon the shoes, huge wigs becurled and bepowdered on the heads, and surmounted by the cocked hat, when not held under the arm, a sword at the side, and commonly a gold-headed cane in the hand (and if the morning be cold, a scarlet cloak thrown over the shoulders)--are daintily picking their way to the palace to kiss His Transparency's hand or dashing up to the gates in heavy carriages with white wigged and cocked-hatted coachmen and footmen. Their ladies wear long and narrow bodices, but their robes flow with a mighty sweep; their apparent stature is increased by very high-heeled shoes and by piling up their hair on lofty cushions; their sleeves are short, but long silk gloves cover the arms. The ecclesiastics, various in name and costume, dress as now, save in the matter of the flowing wig. The Elector's company of guards is out and at intervals the thunder of the artillery on the walls is heard. On all sides, strong and brilliant contrasts of color meet the eye, velvet and silk, purple and fine linen, gold and silver--such were the fashions of the time--costly, inconvenient in form, but imposing, magnificent and marking the differences of rank and class. Let the imagination picture all this, and it will have a scene familiar to the boy Beethoven, and one in which as he grew up to manhood he had his own small part to play.

FOOTNOTES:

[1] "Briefe," II. 354, 355.

[2] This was the beginning of the career of Salomon. He became concertmaster to Prince Henry of Prussia, played in Paris, and in 1781 took up a residence in London where, as violinist and conductor, he became brilliantly active and successful. He made repeated visits to Bonn, once in 1790, when he was on his way to London accompanied by Haydn.

[4] To her Beethoven dedicated his variations on “Venni Amore.”

Chapter II

The Ancestral van Beethoven Family in Belgium--Removal of the Grandfather to Bonn--His Activities as Singer and Chapelmaster--Birth and Education of Johann van Beethoven--The Parents of the Composer.

THE COMPOSER’S BELGIAN ANCESTRY

At the beginning of the seventeenth century a family named van Beethoven lived in a village of Belgium near Louvain. A member of it removed to and settled in Antwerp about 1650. A son of this Beethoven, named William, a wine dealer, married, September 11, 1680, Catherine Grandjean and had issue, eight children. One of them, baptized September 8, 1683, in the parish of Notre Dame, now received the name Henry Adelard, his sponsors being Henry van Beethoven, acting for Adelard de Redincq, Baron de Rocquigny, and Jacqueline Grandjean. This Henry Adelard Beethoven, having arrived at man’s estate, took to wife Maria Catherine de Herdt, who bore him twelve children--the third named Louis, the twelfth named Louis Joseph. The latter, baptized December 9, 1728, married, November 3, 1773, Maria Theresa Schuerweghs, and died November 11, 1808, at Oosterwyck. The second daughter, named like her mother Maria Theresa, married, September 6, 1808, Joseph Michael Jacobs and became the mother of Jacob Jacobs, in the middle of the nineteenth century a professor of painting in Antwerp, who supplied in part the materials for these notices of the Antwerp Beethovens, although the principal credit is due to M. Léon de Burbure of that city.[5]

The certificate of baptism of Louis van Beethoven, third son of Henry Adelard, is to this effect:

Antwerp, December 23, 1712--_Baptizatus_, Ludovicus.

Parents: Henricus van Beethoven and Maria Catherine de Hert.

Sponsors: Petrus Bellmaert and Dymphona van Beethoven.

It is a family tradition--Prof. Jacobs heard it from his mother--that this Louis van Beethoven, owing to some domestic difficulties (according to M. Burbure they were financial), secretly left his father’s house at an early age and never saw it again, although in later years an epistolary correspondence seems to have been established between the fugitive and his parents. Gifted with a good voice and well educated musically, he went to Louvain and applied for a vacant position as tenor to the chapter ad Sanctum Petrum, receiving it on November 2, 1731.[6] A few days later the young man of 18 years was appointed substitute for three months for the singing master (_Phonascus_), who had fallen ill, as is attested by the minutes of the Chapter, under date November 2, 1731.[7]

The young singer does not seem to have filled the place beyond the prescribed time. By a decree of Elector Clemens August, dated March, 1733 (the month of Joseph Haydn’s birth), he became Court Musician in Bonn with a salary of 400 florins, a large one for those days, particularly in the case of a young man who only three months before had completed his 20th year. Allowing the usual year of probation to which candidates for the court chapel were subjected, Beethoven must have come to Bonn in 1732. This corresponds to the time spent at Louvain as well as to a petition of 1774, to be given hereafter, in which Johann speaks of his father’s “42 years of service.” There is another paper of date 1784 which makes the elder Beethoven to have served about 46 years, but this is from another hand and of less authority than that written by the son.

OTHER BEETHOVEN FAMILIES IN BONN

What it was that persuaded Ludwig van Beethoven to go to Bonn is unknown. Gottfried Fischer, who owned the house in the Rheingasse in which two generations of Beethovens lived, professed to know that Elector Clemens August learned to know him as a good singer at Liège and for that reason called him to Bonn. That is not impossible, whether the Elector went to Louvain or Ludwig introduced himself to him at Liège. But it is significant that another branch of the Beethoven family was already represented at Bonn. Michael van Beethoven was born in Malines in February, 1684. He was a son of Cornelius van Beethoven and Catherine

Leempoel, and beyond doubt, as the later associations in Bonn prove, closely related to the Antwerp branch of the family. Michael van Beethoven married Maria Ludovica Stuykers (or Stuykens) on October 8, 1707. His eldest son also bore the name of Cornelius (born in September, 1708, in Malines) and there were four other sons born to him during his stay in Malines, among them two who were named Louis, up to 1715. At a date which is uncertain, this family removed to Bonn. There Cornelius, on February 20, 1734, married a widow named Helena de la Porte (née Calem), in the church of St. Gangolph, Ludwig van Beethoven, the young court singer, being one of the witnesses. In August of the same year Cornelius was proxy for his father (who, evidently, had not yet come to Bonn), as godfather for Ludwig's first child. Later, after his son had established a household, he removed to Bonn, for Michael van Beethoven died in June, 1749, in Bonn, and in December of the same year Maria Ludovica Stuykens (_sic_), "the Widow van Beethoven." Cornelius became a citizen of Bonn on January 17, 1736, on the ground that he had married the widow of a citizen, and in 1738 he stands alone as representative of the name in the list of Bonn's citizens. He seems to have been a merchant, and is probably the man who figures in the annual accounts of Clemens August as purveyor of candles. He lost his wife, and for a second married Anna Barbara Marx, _virgo_, on July 5, 1755, who bore him two daughters (1756 and 1759), both of whom died young and for both of whom Ludwig van Beethoven was sponsor. Cornelius died in 1764 and his wife in 1765, and with this the Malines branch of the family ended. Which one of the two cousins (for so we may in a general way consider them) came to Bonn, Ludwig or Cornelius, must be left to conjecture. There is evidence in favor of the former in the circumstance that Cornelius does not appear as witness at the marriage of Ludwig in 1733. If Ludwig was the earlier arrival, then the story of his call by the Elector may be true; he was not disappointed in his hope of being able to make his way by reason of his knowledge of music and singing.

The next recorded fact in his history may be seen in the ancient register of the parish of St. Remigius, now preserved in the town hall of Bonn. It is the marriage on September 7, 1733, of Ludwig van Beethoven and Maria Josepha Poll, the husband not yet 21 years of age, the wife 19. Then follows in the records of baptisms in the parish:

1734, August 8.

Parents:

Ludwig van Beethoven, Maria Josepha Poll.

Baptized:

Maria Bernardina Ludovica.

Sponsors:

Maria Bernardina Menz, Michael van Beethoven; in his place Cornelius van Beethoven.

The child Bernardina died in infancy, October 17, 1735. Her place was soon filled by a son, Marcus Josephus, baptized April 15, 1736, of whom the parents were doubtless early bereaved, for no other notice whatever has been found of him. After the lapse of some four years the childless pair again became parents, by the birth of a son, whose baptismal record has not been discovered. It is supposed that this child, Johann, was baptized in the Court Chapel, the records of which are not preserved in the archives of the town and seem to be lost; or that, possibly, he was born while the mother was absent from Bonn. An official report upon the condition and characters of the court musicians made in 1784, however, gives Johann van Beethoven _born in Bonn_ and aged forty-four--thus fixing the date of his birth towards the end of 1739 or the beginning of 1740.

The gradual improvement of the elder Beethoven's condition in respect of both emolument and social position, is creditable to him alike as a musician and as a man. Poorly as the musicians were paid, he was able in his last years to save a small portion of his earnings; his rise in social position is indicated in the public records;--thus, the first child is recorded as the son of L. v. Beethoven "musicus"; as sponsor to the eldest daughter of Cornelius van Beethoven, he appears as "Dominus" van Beethoven;--to the second as "Musicus Aulicus"; in 1761 he becomes "Herr Kapellmeister," and his name appears in the Court Calendar of the same year, third in a list of twenty-eight "Hommes de chambre honoraires." Of the elder Beethoven's appointment as head of the court music no other particulars have been obtained than those to be found in his petition and the accompanying decree printed in Chapter I. From these papers it appears that the bass singer has had the promise of the place from Clemens August as successor to Zudoli, but that the Elector, when the vacancy occurred, changed his mind and gave it to his favorite young violinist Touchemoulin, who held the position for so short a time, however, that his name never appears as chapelmaster in the Court Calendar, he having resigned on account of the reduction of his salary by Belderbusch, prime minister of the new Elector who just at that period succeeded Clemens August. The elevation of a singer to such a place was not a very uncommon event in those days, but that a

chapelmaster should still retain his place as singer probably was. Hasse and Graun began their careers as vocalists, but more to the point are the instances of Steffani, Handel's predecessor at the court of Hanover, and of Righini, successively chapelmaster at Mayence and Berlin. In all these cases the incumbents were distinguished and very successful composers. Beethoven was not. Wegeler's words, "the chapelmaster and bass singer had at an earlier date produced operas at the National Theatre established by the Elector," have been rather interpreted than quoted by Schindler and others thus: "it is thought that under the luxury-loving Elector Clemens August, he produced operas of his own composition"--a construction which is clearly forced and incorrect. Strange that so few writers can content themselves with exact citations! Not only is there no proof whatever, certainly none yet made public, that Chapelmaster van Beethoven was an author of operatic works, but the words in his own petition, "inasmuch as the Toxal must be sufficiently supplied with _musique_," can hardly be otherwise understood than as intended to meet a possible objection to his appointment on the ground of his not being a composer. Wegeler's words, then, would simply mean that he put upon the stage and conducted the operatic works produced, which were neither numerous nor of a very high order during his time. His labors were certainly onerous enough without adding musical composition. The records of the electoral court which have been described and in part reproduced in the preceding chapter, exhibit him conducting the music of chapel, theatre and "Toxal," examining candidates for admission into the electoral musical service, reporting upon questions referred to him by the privy council and the like, and all this in addition to his services as bass singer, a position which gave him the principal bass parts and solos to sing both in chapel and theatre. Wegeler records a tradition that in Gassmann's operetta "L'Amore Artigiano" and Monsigny's "Déserteur" he was "admirable and received the highest applause." If this be true it proves no small degree of enterprise on his part as chapelmaster and of well-conserved powers as a singer; for these two operas were first produced, the one in Vienna, the other in Paris, in 1769, when Beethoven had already entered his fifty-eighth year.

The words of Demmer in his petition of January 23, 1773, "the bass singer van Beethoven is incapacitated and can no longer serve as such," naturally suggest the thought that the old gentleman's appearance as _Brunoro_ in Lucchesi's "L'Inganno scoperto" in May, 1773, was a final compliment to his master, the Elector, upon his birthday. He did not live to celebrate another; the death of "Ludwig van Beethoven, Hoffkapellmeister," is recorded at Bonn under date of December 24, 1773--one day after the sixty-first anniversary of his baptism in Antwerp.

CHAPELMASTER VAN BEETHOVEN'S TRIALS

At home the good man had his cross to bear. His wife, Josepha, who with one exception had buried all her children, and possibly on that very account, became addicted to the indulgence of an appetite for strong drink, was at the date of her husband's death living as a boarder in a cloister at Cologne. How long she had been there does not appear, but doubtless for a considerable period. The son, too, was married, but though near was not in his father's house. The separation was brought about by his marriage, with which the father was not agreed. The house in which the chapelmaster died, and which he occupied certainly as early as 1765, was that next north of the so-called Gudenauer Hof, later the post-office in the neighboring Bonngasse, and bore the number 386. The chapelmaster appears, upon pretty good evidence, to have removed hither from the Fischer house in the Rheingasse, where he is said to have lived many years and even to have carried on a trade in wine, which change of dwelling may have taken place in 1767.

When one recalls the imposing style of dress at the era the short, muscular man, with dark complexion and very bright eyes, as Wegeler describes him[8] and as a painting by Courtpainter Radoux, still in possession of his descendants in Vienna, depicts him, presents quite an imposing picture to the imagination.

Of the early life of Johann van Beethoven there are no particulars preserved except such as are directly or indirectly conveyed in the official documents. Such of these papers as came from his own hand, if judged by the standard of our time, show a want of ordinary education; but it must not be forgotten that the orthography of the German language was not then fixed; nor that many a contemporary of his, who boasted a university education, or who belonged to the highest ranks of society, wrote in a style no better than his. This is certain: that after he had received an elementary education he was sent to the _Gymnasium_, for as a member of the lowest class (_infima_) of that institution he took part in September, 1750, as singer in the annual school play which it was the custom of the _Musæ Bonnenses_ to give. It would seem, therefore, that his good voice and musical gifts were appreciated at an early period. Herein, probably, is also to be found the reason why his stay at the gymnasium was not of long duration. The father had set him apart for service in the court music, and himself, as appears from the statements already printed, undertook his instruction; he taught him singing and clavier playing. Whether or not he also taught him violin playing, in which he was "capable," remains uncertain. In 1752, at the age of 12, as can be seen from his petition of March, 1756, and his father's of 1764, he entered the chapel as soprano. According to Gottwald's report of 1756 he had served "about 2 years"; the contradiction is probably explained by an interruption caused by the mutation of his voice. At the age of 16, he received his _decretum_ as "accessist" on the

score of his skill in singing and his experience already acquired, including his capability on the violin, which was the basis of the decree of April 24, 1764, granting him a salary of 100 rth. per annum.

So, at the age of 22, the young man received the promise of a salary, and at 24 obtained one of 100 thalers. In 1769, he received an increase of 25 fl., and 50 fl. more by the decree of April 3, 1772. He had, moreover, an opportunity to gain something by teaching. Not only did he give lessons in singing and clavier playing to the children of prominent families of the city, but he also frequently was called on to prepare young musicians for service in the chapel. Thus Demmer, says the memorandum heretofore given, “paid 6 rth. to young Mr. Beethoven for 3 months”; and a year later the following resolve of the privy council was passed:

Ad Suppl. Joan Beethoven

The demands of the suppliant having been found to be correct, the Electoral Treasury is commanded to satisfy the debt by the usual withdrawal of the sum from the salary of the defendant.

Bonn, May 24, 1775.

Attest. P.

which probably refers to a debt contracted by one of the women of the court chapel. A few years later, as we have seen, he seems to have been intrusted with the training of Johanna Helena Averdonck, whom he brought forward as his pupil in March, 1778, and the singer Gazzenello was his pupil before she went elsewhere. It was largely his own fault that the musically gifted man was unfortunate in both domestic and official relations. His intemperance in drink, probably inherited from his mother but attributed by old Fischer to the wine trade in which his father embarked, made itself apparent at an early date, and by yielding to it more and more as he grew older he undoubtedly impaired his voice and did much to bring about his later condition of poverty. How it finally led to a catastrophe we shall see later. According to the testimony of the widow Karth, he was a tall, handsome man, and wore powdered hair in his later years. Fischer does not wholly agree with her: “of medium height, longish face, broad forehead, round nose, broad shoulders, serious eyes, face somewhat scarred, thin pigtail.” Three and a half years after obtaining his salary of 100 th. he ventured to marry. Heinrich Kewerich, the father of his wife, was head cook in that palace at Ehrenbreitstein in which Clemens danced himself out of this world, but he died before that event took place.[9] His wife, as the church records testify, was Anna Clara Daubach. Her daughter Maria Magdalena, born December 19, 1746, married a certain Johann Laym, valet of the Elector of Trèves, on January 30, 1763. On November 28, 1765, the husband died, and Maria Magdalena was a widow before she had completed her 19th year. In a little less than two years the marriage register of St. Remigius, at Bonn, was enriched by this entry:

THE PARENTS OF THE COMPOSER

12ma 9bris. Praevia Dispensatione super 3bus denuntiationibus copulavi D. Joannem van Beethoven, Dni. Ludovici van Beethoven et Mariae Josephae Poll conjugum filium legitimum, et Mariam Magdalenam Keferich viduam Leym ex Ehrenbreitstein, Henrici Keferich et annae clarae Westorffs filiam legitimam. Coram testibus Josepho clemente Belseroski et philippo Salomon.

That is, Johann van Beethoven has married the young widow Laym.

How it came that the marriage took place in Bonn instead of the home of the bride we are told by Fischer. Chapelmaster van Beethoven was not at all agreed that his son should marry a woman of a lower station in life than his own. He did not continue his opposition against the fixed determination of his son; but it is to be surmised that he would not have attended a ceremony in Ehrenbreitstein, and hence the matter was disposed of quickly in Bonn. After the wedding the young pair paid a visit of a few days’ duration to Ehrenbreitstein.

CHARACTER OF MME. VAN BEETHOVEN

Fischer describes Madame van Beethoven as a “handsome, slender person” and tells of her “rather tall, longish face, a nose somewhat bent (_gehöffelt_, in the dialect of Bonn), spare, earnest eyes.” Cäcilia Fischer could not recall that she had ever seen Madame van Beethoven laugh; “she was always serious.” Her life’s vicissitudes may have contributed to this disposition:--the early loss of her father, and of her first husband, and the death of her mother scarcely more than a year after her second marriage. It is difficult to form a conception of her character because of the paucity of information about her. Wegeler lays stress upon her piety and gentleness; her amiability and kindliness towards her family appear from all the reports; nevertheless, Fischer betrays the fact that she could be vehement in controversies with the other occupants of the house. “Madame van Beethoven,” Fischer continues,

“was a clever woman; she could give converse and reply aptly, politely and modestly to high and low, and for this reason she was much liked and respected. She occupied herself with sewing and knitting. They led a righteous and peaceful married life, and paid their house-rent and baker’s bills promptly, quarterly, and on the day. She[10] was a good, a domestic woman, she knew how to give and also how to take in a manner that is becoming to all people of honest thoughts.” From this it is fair to assume that she strove to conduct her household judiciously and economically; whether or not this was always possible in view of the limited income, old Fischer does not seem to have been informed. She made the best she could of the weaknesses of her husband without having been able to influence him; her care for the children in externals was not wholly sufficient. Young Ludwig clung to her with a tender love, more than to the father, who was “only severe”; but there is nothing anywhere to indicate that she exerted an influence upon the emotional life and development of her son, and in respect of this no wrong will be done her if the lower order of her culture be taken into consideration. Nor must it be forgotten that in all probability she was naturally delicate and that her health was still further weakened by her domestic troubles and frequent accouchements. The “quiet, suffering woman,” as Madame Karth calls her, died in 1787 of consumption at the age of 40 years. Long years after in Vienna Beethoven was wont, when among his intimate friends, to speak of his “excellent” (_vortreffliche_) mother.[11]

At the time when Johann van Beethoven married, there was quite a colony of musicians, and other persons in the service of the court, in the Bonngasse, as that street is in part named which extends from the lower extremity of the market-place to the Cologne gate. Chapelmaster van Beethoven had left the house in the Rheingasse and lived at No. 386. In the adjoining house, north, No. 387, lived the musical family Ries. Farther down, the east house on that side of the way before the street assumes the name Kölnerstrasse was the dwelling of the hornist, afterward publisher, Simrock. Nearly opposite the chapelmaster’s the second story of the house No. 515 was occupied (but not till after 1771) by the Salomons; the parterre and first floor by the owner of the house, a lace-maker or dealer in laces, named Clasen. Of the two adjoining houses the one No. 576 was the dwelling of Johann Baum, a master locksmith, doubtless the Jean Courtin, “serrurier,” of the Court Calendar for 1773. In No. 617 was the family Hertel, twelve or fifteen years later living under the Beethovens in the Wenzelgasse, and not far off a family, Poll, perhaps relations of Madame Beethoven the elder. Conrad Poll’s name is found in the Court Calendars of the 1770’s as one of the eight Electoral “Heiducken” (footmen). In 1767 in the rear of the Clasen house, north[12] there was a lodging to let; and there the newly married Beethovens began their humble housekeeping. Their first child was a son, Ludwig Maria, baptized April 2, 1769, whose sponsors, as may be read in the register of St. Remigius parish, were the grandfather Beethoven and Anna Maria Lohe, wife of Jean Courtin, the next-door neighbor. This child lived but six days. In two years the loss of the parents was made up by the birth of him who is the subject of this biography.

FOOTNOTES:

[5] In Fétis’ “Biographie universelle” (new ed.) several of these names are misprinted. They are corrected here from Mr. Jacobs’ letter to A. W. T.

[6] Thayer’s account of this period in the life of Beethoven’s grandfather has here been extended from an article by the Chevalier L. de Burbure, published in the “Biographie nationale publiée par l’Académie Royale des sciences, des lettres et des beaux arts de Belgique.” Tome II. p. 105. (Brussels, 1868.) From this it further appears that two other members of the Antwerp branch of the family were devoted to the fine arts, viz.: Peter van Beethoven, painter, pupil of Abr. Genoel, jr., and Gerhard van Beethoven, sculptor, accepted in the guild of St. Luke about 1713, Director Vollmer, of Brussels, in a communication to Dr. Deiters gave information of a branch of the family in Mechlin and of still another in Brabant where, in the village of Wambeke, there was a curé van Beethoven who must either have died or been transferred between 1729 and 1732.

[7] The original entry is printed in full in the German edition of this biography.

[8] “The grandfather was a man short of stature, muscular, with extremely animated eyes, and was greatly respected as an artist.” Fischer’s description is different, but Wegeler is the more trustworthy witness of the two.

[9] The church records at Ehrenbreitstein say that he died August 2, 1759, in Molzberg, at the age of 58; his funeral took place in Ehrenbreitstein. A Frau Eva Katharina Kewerich, who died at Ehrenbreitstein on October 10, 1753, at the age of 89 years, was probably his mother.

[10] Some notes by Fischer contain the characteristic addition: “Madame van Beethoven once remarked that the most necessary things, such as house-rent, the baker, shoemaker and tailor must first be paid, but she would never pay drinking debts.”

[11] In the collection of Beethoven relics in the Beethoven House in Bonn there is a portrait which is set down as that of Beethoven's mother. The designation, however, rests only on uncertain tradition and lacks authoritative attestation. It is certainly difficult to see in it the representation of a consumptive woman only 40 years old. Moreover, it is strange that Beethoven should have sent from Vienna for the portrait of his grandfather and not for that of his dearly loved mother had one been in existence. It is only because of a resemblance between this picture and another that the belief exists that portraits of both of the parents of Beethoven are in existence. In 1890 two oil portraits were found in a shed in Cologne and restored by the painter Kempen, who recognized in them the handiwork of the painter Beckenkamp, who, like Beethoven's mother, was born in Ehrenbreitstein, was a visitor at the Beethoven home in Bonn and died in Cologne in 1828. The female portrait agrees with that in Bonn; they are life-size, finely executed pictures, but they are certainly not Beethoven's parents. Enough has been said about the portrait of the mother. In the case of that of the father the first objection is that it also lacks authentication. Fischer's description does not wholly fit the picture; the old man would not have forgotten the protruding lower lip. But the entire expression of the face, serious, it is true, but fleshy and vulgar, and the gray perruque, do not conform to what we know of the easy-going musician. It will be difficult, too, to trace any resemblance of expression between it and the familiar one of Beethoven from which a conclusion might be drawn. So long as proofs are wanting, scientific biography will have no right to accept the portraits as those of Beethoven's parents. Reproductions of them may be found in the "Musical Times" of London, December 15, 1892.

[12] The house is now owned by the Beethoven-Haus Verein, and maintained as a Beethoven museum.

Chapter III

The Childhood of Beethoven--An Inebriate Grandmother and a Dissipated Father--The Family Homes in Bonn--The Boy's Schooling--His Music Teachers--Visits Holland with his Mother.

THE DATE OF BEETHOVEN'S BIRTH

There is no authentic record of Beethoven's birthday. Wegeler, on the ground of custom in Bonn, dates it the day preceding the ceremony of baptism--an opinion which Beethoven himself seems to have entertained. It is the official record of this baptism only that has been preserved. In the registry of the parish of St. Remigius the entry appears as follows:

Parentes: _D: Joannes van Beethoven & Helena Keverichs, conjuges_

Proles: _17ma Xbris. Ludovicus_

Patrini: _D: Ludovicus van Beethoven & Gertrudis Müllers dicta Baums_

The sponsors, therefore, were Beethoven's grandfather the chapelmaster, and the wife of the next-door neighbor, Johann Baum, secretary at the electoral cellar. The custom obtaining at the time in the Catholic Rhine country not to postpone the baptism beyond 24 hours after the birth of a child, it is in the highest degree probable that Beethoven was born on December 16, 1770.[13]

Of several certificates of baptism the following is copied in full for the sake of a remark upon it written by the master's own hand:

Department de Rhin et Moselle Mairie de Bonn.

Extrait du Registre de Naissances de la Paroisse de St. Remy à Bonn.

Anno millesimo septingentesimo septuagesimo, de decima septima Decembris baptizatus est Ludovicus. Parentes D: Joannes van Beethoven et Helena[14] Keverichs, conjuges. Patrini, D: Ludovicus van Beethoven et Gertrudis Müllers dicta Baums.

Pour extrait conforme délivré à la Mairie de Bonn. _Bonn le 2 Juin, 1810._ [_Signatures and official seals._]

On the back of this paper Beethoven wrote:

"Es scheint der Taufschein nicht richtig, 1772 da noch ein Ludwig vor mir. Eine Baumgarten war glaube ich mein Pathe.

Ludwig van Beethoven."[15]

The composer, then, even in his fortieth year still believed the correct date to be 1772, which is the one given in all the old biographical notices, and which corresponds to the dates affixed to many of his first works, and indeed to nearly all allusions to his age in his early years. Only by keeping this fact in mind, can the long list of chronological contradictions, which continually meet the

student of his history during the first half of his life, be explained or comprehended. Whoever examines the original record of baptism in the registry at Bonn, sees instantly that the certificate, in spite of Beethoven, is correct; but all possible doubt is removed by the words of Wegeler:

Little Louis clung to this grandfather ... with the greatest affection, and, young as he was when he lost him, his early impressions always remained lively. He liked to speak of his grandfather with the friends of his youth, and his pious and gentle mother, whom he loved much more than he did his father, who was only severe, was obliged to tell him much of his grandfather.

Had 1772 been the correct date the child could never have retained personal recollections of a man who died on December 24, 1773. A survey of the whole ground renders the conclusion irresistible that at the time when the boy began to attract notice by his skill upon the pianoforte and by the promise of his first attempts in composition, his age was purposely falsified, a motive for which may perhaps be found in the excitement caused in the musical world by the then recent career of the Mozart children, and in the reflection that attainments which in a child of eight or ten years excite wonder and astonishment are considered hardly worthy of special remark in one a few years older. There is, unfortunately, nothing known of Johann van Beethoven's character which renders such a trick improbable. Noteworthy is it that, at first, the falsification rarely extends beyond one year; and, also, that in an official report in 1784 the correct age is given. Here an untruth could not be risked, nor be of advantage if it had been.

Dr. C. M. Kneisel, who championed the cause of the house in the Bonngasse in a controversy conducted in the "Kölnische Zeitung" in 1845, touching the birthplace of Beethoven, remarks that the mother "was, as is known, a native of the Ehrenbreitstein valley and separated from her relatives; he (Johann van Beethoven) was without relatives and in somewhat straitened circumstances financially. What, then, was more natural than that he should invite his neighbor, Frau Baum, a respected and well-to-do woman, _in whose house the baptismal feast was held_, to be sponsor for his little son?" This last fact indicates clearly the narrowness of the quarters in which the young couple dwelt. Does it not also hint that the grandfather was now a solitary man with no home in which to spread the little feast? Let Johann van Beethoven himself describe the pecuniary condition in which he found himself upon the death of his father:

Most Reverend Archbishop, Most Gracious Elector and Lord, Lord.

Will Your Electoral Grace graciously be pleased to hear that my father has passed away from this world, to whom it was granted to serve his Electoral Grace Clemens August and Your Electoral Grace and gloriously reigning Lord Lord 42 years, as chapelmaster with great honor, whose position I have been found capable of filling, but nevertheless I would not venture to offer my capacity to Your Electoral Grace, but since the death of my father has left me in needy circumstances my salary not sufficing and I compelled to draw on the savings of my father, my mother still living and in a cloister at a cost of 60 rth. for board and lodging each year and it is not advisable for me to take her to my home. Your Electoral Grace is therefore humbly implored to make an allowance from the 400 rth. vacated for an increase of my salary so that I may not need to draw upon the little savings and my mother may receive the pension graciously for the few years which she may yet live, to deserve which high grace it shall always be my striving.

Your Electoral Grace's Most humble and obedient Servant and musicus jean van Beethoven.

There is something bordering on the comic in the coolness of the hint here given that the petitioner would not object to an appointment as his father's successor, especially when it is remembered that Lucchesi and Mattioli were already in Bonn and the former had sufficiently proved his capacity by producing successful operas, both text and music, for the Elector's delectation. The hint was not taken; what provision was granted him, however, may be seen from a petition of January 8, 1774, praying for an addition to his salary from that made vacant by the death of his father, and a pension to his mother who is kept at board in a cloister. A memorandum appears on the margin to the effect that the Elector graciously consents that the widow, so long as she remains in the cloister, shall receive 60 rth. quarterly. Another petition of a year later has been lost, but its contents are indicated in the response, dated June 5, 1775, that Johann van Beethoven on the death of his mother shall have the enjoyment of the 60 rth. which had been granted her. The death of the mother followed a few months later and was thus announced in the "Intelligenzblatt" of Bonn on October 3, 1775: "Died, on September 30, Maria Josepha Pals (_sic_), widow van Beethoven, aged 61 years." In a list of salaries for 1776 (among the papers at Düsseldorf) for the "Musik Parthie" the salary of Johann van Beethoven is given at 36 rth. 45 alb. payable quarterly. The fact of the great poverty in which he and his family lived is manifest from the official documents (which confirm the many traditions to that effect) and from the more important recollections of aged people of Bonn brought to light in a controversy concerning the birthplace of the composer. For instance, Dr. Hennes, in his unsuccessful effort to establish the claims of the Fischer house in the Rheingasse, says: "The legacy left him (Johann van Beethoven) by his father did not last long.

That fine linen, which, as I was told, could be drawn through a ring, found its way, piece by piece, out of the house; even the beautiful large portrait showing the father wearing a tasseled cap and holding a roll of music, went to the second-hand shop." This is an error, though the painting may have gone for a time to the pawnbroker.

From the Bonngasse the Beethovens removed, when, is uncertain, to a house No. 7 or No. 8 on the left as one enters the Dreieckplatz in passing from the Sternstrasse to the Münsterplatz. They were living there in 1774, for the baptism of another son on the 8th of April of that year is recorded in the register of the parish of St. Gangolph, to which those houses belonged. This child's name was Caspar Anton Carl, the first two names from his sponsor the Minister Belderbusch, the third from Caroline von Satzenhofen, Abbess of Vilich. Was this condescension on the part of the minister and the abbess intended to soothe the father under the failure of his hopes of advancement? From the Dreieckplatz the Beethovens migrated to the Fischer house, No. 934 in the Rheingasse, so long held to be the composer's birthplace and long thereafter distinguished by a false inscription to that effect. Whether the removal took place in Ludwig's fifth or sixth year is not known; but at all events it was previous to the 2nd of October, 1776, for upon that day another son of Johann van Beethoven was baptized in the parish of St. Remigius by the name of Nicholas Johann. Dr. Hennes in his letter to the "Kölnische Zeitung" lays much stress upon the testimony of Cäcilia Fischer. He says: "the maiden lady of 76 years, Cäcilia Fischer, still remembers distinctly to have seen little Louis in his cradle and can tell many anecdotes about him, etc." The mistake is easily explained without supposing any intentional deception:--62 years afterwards she mistook the birth of Nicholas Johann for that of Ludwig. According to Fischer's report the family removed from this house in 1776 for a short time to one in the Neugasse, but returned again to the house in the Rheingasse after the palace fire in 1777. One thought which suggests itself in relation to these removals of Johann van Beethoven may, perhaps, be more than mere fancy: that in expectation of advancement in position upon the death of his father he had exchanged the narrow quarters of the lodging in the rear of the Clasen house for the much better dwelling in the Dreieckplatz; but upon the failure of his hopes had been fain to seek a cheaper place in the lower part of the town down near the river.

THE BOY BEETHOVEN'S EARLY STUDY

There is nothing decisive as to the time when the musical education of Ludwig van Beethoven began, nor any positive evidence that he, like Handel, Haydn or Mozart, showed remarkable genius for the art at a very early age. Schlosser has something on this point, but he gives no authorities, while the particulars which he relates could not possibly have come under his own observation. Müller[16] had heard from Franz Ries and Nicholas Simrock that Johann van Beethoven gave his son instruction upon the pianoforte and violin "in his earliest childhood.... To scarcely anything else did he hold him." In the dedication of the pianoforte sonatas (1783) to the Elector, the boy is made to say: "Music became my first youthful pursuit in my fourth year," which might be supposed decisive on the point if his age were not falsely given on the title-page. This much is certain: that after the removal to the Fischer house the child had his daily task of musical study and practice given him and in spite of his tears was forced to execute it. "Cäcilia Fischer," writes Hennes (1838), "still sees him, a tiny boy, standing on a little footstool in front of the clavier to which the implacable severity of his father had so early condemned him. The patriarch of Bonn, Head Burgomaster Windeck, will pardon me if I appeal to him to say that he, too, saw the little Louis van Beethoven in this house standing in front of the clavier and weeping." To this writes Dr. Wegeler:

I saw the same thing. How? The Fischer house was, perhaps still is, connected by a passage-way in the rear with a house in the Giergasse, which was then occupied by the owner, a high official of the Rhenish revenue service, Mr. Bachen, grandfather of Court Councillor Bachen of this city. The youngest son of the latter, Benedict, was my schoolmate, and on my visits to him the doings and sufferings of Louis were visible from the house.

It must be supposed that the father had seen indications of his son's genius, for it is difficult to imagine such an one remaining unperceived; but the necessities of the family with the failure of the petition for a better salary--sent in just at the time when the Elector was so largely increasing his expenditures for music by the engagement of Lucchesi and Mattioli and in other ways--are sufficient reasons for the inflexible severity with which the boy was kept at his studies. The desire to say something new and striking on the part of many who have written about Beethoven has led to such an admixture of fact and fancy that it is now very difficult to separate them. One (Schlosser) tells his readers that "the greatest joy of the lad was when his father took him upon his knees and permitted him to accompany a song on the clavier with his tiny fingers," while others tell the tale of his childhood in a manner to convey the idea that the father was a pitiless tyrant, the boy a victim and a slave--an error which a calm consideration of what is really known of the facts in the case at once dispels. There is but one road to excellence, even for the genius of a Handel or a Mozart--unremitted application. To this young Ludwig was compelled, sometimes, no doubt, through the fear or the actual infliction of punishment for neglect; sometimes, too, the father, whose habits were such as to favor a bad interpretation of his

conduct, was no doubt harsh and unjust. And such seems to be the truth. At any rate, the boy at an early date acquired so considerable a facility upon the clavier that his father could have him play at court and when he was seven years old produce him with one of his pupils at a concert in Bonn. Here is the announcement of the concert as it was reproduced in the “Kölnische Zeitung” of December 18, 1870, from the original:

AVERTISSEMENT

To-day, March 26, 1778, in the musical concert-room in the Sternengasse the Electoral Court Tenorist, Beethoven, will have the honor to produce two of his scholars, namely, Mlle. Averdonck, Court Contraltist, and his little son of six years. The former will have the honor to contribute various beautiful arias, the latter various clavier concertos and trios. He flatters himself that he will give complete enjoyment to all ladies and gentlemen, the more since both have had the honor of playing to the greatest delight of the entire Court.

Beginning at five o’clock in the evening.

Ladies and gentlemen who have not subscribed will be charged a florin. Tickets may be had at the aforesaid Akademiesaal, also of Mr. Claren auf der Bach in Mühlenstein.

Unfortunately we learn nothing concerning the pieces played by the boy nor of the success of his performance. That the violin as well as the pianoforte was practised by him is implicitly confirmed by the terms in which Schindler records his denial of the truth of the well-known spider story: “The great Ludwig refused to remember any such incident, much as the tale amused him. On the contrary, he said it was more to be expected that everything would have fled from his scraping, even flies and spiders.”

PAUCITY OF INTELLECTUAL TRAINING

The father’s main object being the earliest and greatest development of his son’s musical genius so as to make it a “marketable commodity,” he gave him no other school education than such as was afforded in one of the public schools. Fischer says he first attended a school in the Neugasse taught by a man named Huppert[17] and thence went to the Münsterschule. Among the lower grade schools in Bonn was the so-called Tirocinium, a Latin school, which prepared pupils for the gymnasium but was not directly connected with it, but had its own corps of teachers, like the whole educational system of the period, under the supervision of the Academic Council established by Max Friedrich in 1777. The pupils learned, outside of the elementary studies (arithmetic and writing are said to have been excluded), to read and write Latin up to an understanding of Cornelius Nepos. Johann Krengel, a much respected pedagogue, was teacher at the time and was appointed municipal schoolmaster in 1783 by the Academic Council. In 1786 he transferred the school to the Bonngasse. To this school young Beethoven was sent; when, is uncertain. His contemporary and schoolfellow Wurzer, Electoral Councillor and afterwards president of the Landgericht, relates the following in his memoirs:[18]

One of my schoolmates under Krengel was Luis van Beethoven, whose father held an appointment as court singer under the Elector. Apparently his mother was already dead at the time,[19] for Luis v. B. was distinguished by uncleanliness, negligence, etc. Not a sign was to be discovered in him of that spark of genius which glowed so brilliantly in him afterwards. I imagine that he was kept down to his musical studies from an early age by his father.

Wurzer entered the gymnasium in 1781; Beethoven did not. This, therefore, must have been the time at which all other studies were abandoned in favor of music. In what manner his education was otherwise pieced out is not to be learned. The lack of proper intellectual discipline is painfully obvious in Beethoven’s letters throughout his life. In his early manhood he wrote a fair hand, so very different from the shocking scrawl of his later years as to make one almost doubt the genuineness of autographs of that period; but in orthography, the use of capital letters, punctuation and arithmetic he was sadly deficient all his life long. He was still able to use the French tongue at a later period, and of Latin he had learned enough to understand the texts which he composed; but even as a schoolboy his studies appear to have been made second to his musical practice with which his hours out of school were apparently for the most part occupied. He was described by Dr. Müller as “a shy and taciturn boy, the necessary consequence of the life apart which he led, observing more and pondering more than he spoke, and disposed to abandon himself entirely to the feelings awakened by music and (later) by poetry and to the pictures created by fancy.” Of those who were his schoolfellows and who in after years recorded their reminiscences of him, not one speaks of him as a playfellow, none has anecdotes to relate of games with him, rambles on the hills or adventures upon the Rhine and its shores in which he bore a part. Music and ever music; hence the power of clothing his thoughts in words was not developed by early culture, and the occasional bursts of eloquence in his

letters and recorded conversations are held not to be genuine, because so seldom found. As if the strong mind, struggling for adequate expression, should not at times break through all barriers and overcome all obstacles![20] Urged forward thus by the father's severity, by his tender love for his mother and by the awakening of his own tastes, the development of his skill and talents was rapid; so much so that in his ninth year a teacher more competent than his father was needed.

BEETHOVEN AND VAN DEN EEDEN

The first to whom his father turned was the old court organist van den Eeden, who had been in the electoral service about fifty years and had come to Bonn before the arrival there of Ludwig van Beethoven, the grandfather. One can easily imagine his willingness to serve an old and deceased friend by fitting his grandson to become his successor; and this might account for Schlosser's story that at first he taught him gratis, and that he continued his instructions at the command and expense of the Elector. The story may or may not be true, but nothing has been discovered in the archives at Düsseldorf confirming the statement; in fact concerning the time, the subjects and the results of van den Eeden's instruction we are thrown largely upon conjecture. "In his eighth year," says Mäurer in his notices, "Court Organist van den Eeden took him as a pupil; nothing has been learned of his progress." This, if Mäurer was correct in stating his age, would have been about 1778. It is after this that Mäurer refers to his study under Pfeiffer. Independently of all this Fischer says: "His father not being able to teach him more in music, and suspecting that he had talent for composition, took him at first to an aged master named Santerrini who instructed him for a while; but the father thought little of this teacher, did not consider him the right man and desired a change." This desire resulted in securing Pfeiffer through the mediation of Grossmann. There was no musician Santerrini in the court chapel, but an actor, named Santorini, was a member of Grossmann's troupe; he cannot be considered in this connection. There is evidently a confusion of names, and the whole context, especially the reference to the "aged master," shows that no other than van den Eeden was meant by the teacher who gave instruction for a short time before Pfeiffer.

Schlosser does not say that this instruction was on the organ and it is unlikely that the boy, who was destined for a more systematic instruction in pianoforte playing, was put at the organ at so early an age. It was a deduction, probably, from the fact that van den Eeden was an organist and that later Beethoven displayed a great deal of dexterity upon that instrument. It is noteworthy that Wegeler (p. 11) says nothing definite as to whether or not Beethoven took lessons from van den Eeden; he merely thought it likely, because he knew no one else in Bonn from whom Beethoven could have learned the technical handling of the organ. But there were several such in Bonn irrespective of Neefe. Schindler makes certainty out of Wegeler's conjecture and relates that Beethoven often spoke of the old organist when discoursing upon the proper position and movement of the body and hands in organ and pianoforte playing, he having been taught to hold both calm and steady, to play in the connected style of Handel and Bach. This may have been correct so far as pianoforte playing is concerned; but Schindler had little knowledge of Beethoven's Bonn period, and the possibility of a confusion of names is not excluded even on the part of Beethoven himself, who received hints from several organists. Mäurer, after speaking of Pfeiffer, continues as follows: "Van den Eeden remained his only teacher in thorough-bass. As a man of seventy he sent the boy Louis, between eleven and twelve years old, to accompany the mass and other church music on the organ. His playing was so astonishing that one was forced to believe he had intentionally concealed his gifts. While preluding for the _Credo_ he took a theme from the movement and developed it to the amazement of the orchestra so that he was permitted to improvise longer than is customary. That was the opening of his brilliant career." Mäurer seems to know nothing of Neefe when he says that van den Eeden was Beethoven's only teacher in thorough-bass. What he says, too, about the lad's performance at the organ as substitute obviously rests upon a confounding of van den Eeden with another of Beethoven's organ teachers--most likely Neefe.

It is our conjecture that van den Eeden taught the boy chiefly and perhaps exclusively pianoforte playing, he being a master in that art; but his influence was small. It must be remembered that van den Eeden was a very old man, as whose successor Neefe had been chosen in 1781, and who died in June, 1782. Nowhere does he, like the other teachers of Beethoven, disclose individual traits; he is a totally colorless picture in the history of Beethoven's youth. Nor does it appear that there was any intimacy between him and the Beethoven family, since otherwise he would not have been missing in the notices of Fischer, who does not even know his name. The judgment of the father that his instruction was inefficient was probably correct.

OTHER TEACHERS OF THE BOY BEETHOVEN

A fitter master, it was thought, was obtained in Tobias Friedrich Pfeiffer, who came to Bonn in the summer of 1779, as tenor singer in Grossmann and Helmuth's theatrical company. Mäurer, the violoncellist, in some reminiscences of that period communicated to this work by Professor Jahn, says that Pfeiffer was a skillful pianist and gave the boy lessons, but not at any regular hours. Often

when he came with Beethoven, the father, from the wine-house late at night, the boy was roused from sleep and kept at the pianoforte until morning;--a course not particularly favorable to his progress at school, but one which may be readily credited in the light of what is known of Pfeiffer and Johann Beethoven, and one, moreover, which would cause the lessons to make an enduring impression upon the memory. There is some reason to think that the former was an inmate of the latter's family, which adds probability to the story. Although Pfeiffer was in Bonn but one year, Wegeler affirms that "Beethoven owed most of all to this teacher, and was so appreciative of the fact that he sent him financial help from Vienna through Simrock." To what extent Wegeler's opinion as to Beethoven's obligations is correct, it would be difficult to decide; but the utter improbability that a single year's lessons from this man would profit a boy eight and a half to nine and a half years old, more than those from any other of his teachers, much longer and systematically continued, is manifest. About this time the young court musician Franz Georg Rovantini lived in the same house with Beethoven. He was the son of a violinist Johann Conrad Rovantini who had been called to Bonn from Ehrenbreitstein and who died in 1766. He was related to the Beethoven family. The young musician was much respected and sought after as teacher. According to the Fischer document the boy Beethoven was among his pupils, taking lessons on the violin and viola. But these lessons, too, came to an early end; Rovantini died on September 9, 1781, aged 24.

A strong predilection for the organ was awakened early in the lad and he eagerly sought opportunities to study the instrument, apparently even before he became Neefe's pupil. In the cloister of the Franciscan monks at Bonn there lived a friar named Willibald Koch, highly respected for his playing and his expert knowledge of organ construction. We have no reason to doubt that young Ludwig sought him out, received instruction from him and made so much progress that Friar Willibald accepted him as assistant. In the same way he made friends with the organist in the cloister of the Minorites and "made an agreement" to play the organ there at 6 o'clock morning mass. It would seem that he felt the need of familiarity with a larger organ than that of the Franciscans. On the inside of the cover of a memorandum book which he carried to Vienna with him is found the note: "Measurements (_Fussmass_) of the Minorite pedals in Bonn." Plainly he had kept an interest in the organ. Still another tradition is preserved in a letter to the author from Miss Auguste Grimm, dated September, 1872, to the effect that Heinrich Theisen, born in 1759, organist at Rheinbreitbach near Honneck on the Rhine, studied the organ in company with Beethoven under Zenser, organist of the Münsterkirche at Bonn, and that the lad of ten years surpassed his fellow student of twenty. The tradition says that already at that time Ludwig composed pieces which were too difficult for his little hands. "Why, you can't play that, Ludwig," his teacher is said to have remarked, and the boy to have replied: "I will when I am bigger."

When Beethoven's studies with van den Eeden began and ended, whether they were confined to the organ or pianoforte, or partook of both--these are undecided points. It does not appear that any instruction in composition was given him until he became the pupil of Neefe. In the _facsimile_ which follows the part devoted to thorough-bass in the so-called "Studien," the composer says: "Dear Friends: I took the pains to learn this only that I might write the figures readily and later instruct others; for myself I never had to learn how to avoid errors, for from my childhood I had so keen a sensibility that I wrote correctly without knowing it had to be so, or could be otherwise." This lends plausibility, at least, to another anecdote related by Mäurer concerning an alleged precocious composition by Beethoven:

THE STORY OF A FIRST COMPOSITION

About this time the English Ambassador to the Elector's court, named Kressner, who had extended help to the Beethoven family, living scantily on a salary of 400 fl. [?], died. Louis composed a funeral cantata to his memory--his first composition. He handed his score to Lucchesi and asked him to correct the errors. Lucchesi gave it back with the remark that he could not understand it, and therefore could not comply with his request, but would have it performed. At the first rehearsal there was great astonishment at the originality of the composition, but approval was divided; after a few rehearsals the approbation grew and the piece was performed with general applause.

George Cressener came to Bonn in the autumn of 1755, and died there January 17, 1781, in the eighty-first year of his age. The "about this time" in Mäurer's story agrees, therefore, well enough with that date; it is, however, a suspicious circumstance that Mäurer had left the service and returned to Cologne in the Spring of 1780 and, therefore, was not eye-witness to the fact; and another that the circumstance was not remembered by other members of the court chapel, not even by Franz Ries, nor by Neefe, who, though not then a member, was already in Bonn. "In 1780," continues Mäurer, "Beethoven got acquainted with Zambona, who called his attention to his neglected education, gave him lessons daily in Latin, Louis continuing a year (in six weeks he read Cicero's letters!)--also logic, French and Italian--until Zambona left Bonn in order to become bookkeeper for Bartholdy in Mühlheim." In the "Geheime Staats-Conferenz Protocollen," May 20, 1787, one reads: "Stephan Zambona prays to be appointed, _Kammerportier_, etc.," to which is appended the remark: "the request not granted." Zambona is a name, too, which, half a dozen

years later, often appears in the Bonn “Intelligenzblatt,” as that of a shopkeeper in the Market Place of that town. If the story of the cantata be doubtful, that of these private studies on the part of a boy in Beethoven’s position, only in his tenth year and a schoolboy then if ever, like Hamlet’s possible dreams in the sleep of death, must “give us pause.”

Mother and son undertook a voyage to Holland in the beginning of the winter of 1781. The widow Karth, one of the Hertel family, born in 1780 and still living in Bonn in 1861, passed her childhood in the house No. 462 Wenzelgasse in the upper story of which the Beethovens then lived. One of her reminiscences is in place here. She distinctly remembered sitting, when a child, upon her own mother’s knee, and hearing Madame van Beethoven--“a quiet, suffering woman”--relate that when she went with her little boy Ludwig to Holland it was so cold on the boat that she had to hold his feet in her lap to prevent them from being frostbitten; and also that, while absent, Ludwig played a great deal in great houses, astonished people by his skill and received valuable presents. The circumstance of the cold feet warmed in the mother’s lap, is precisely one to fasten itself in the memory of a child and form a point around which other facts might cluster.[21]

Another incident related in connection with this journey to Holland--not as a fact, but as one which she had heard spoken of in her childhood--and one very difficult to comprehend, is, that some person, whether an envious boy or a heartless adult she could not tell, drew a knife across the fingers of Ludwig to disable him from playing!

FOOTNOTES:

[13] In one of Beethoven’s conversation books his nephew writes on December 15, 1823: “To-day is the 15th of December, the day of your birth, but I am not sure whether it is the 15th or 17th, inasmuch as we can not depend on the certificate of baptism and I read it only once when I was still with you in January.” The nephew, it will be observed, does not appeal to a family tradition but to the baptismal certificate and the uncertainty, therefore, is with reference to the date of baptism, not of birth. Hence the deduction which Kalischer makes (“Vossische Zeitung,” No. 17, 1891) that Beethoven was born on December 15. Hesse calls to witness a clerk employed in Simrock’s establishment with whom Beethoven had business transactions, and who had written on the back of the announcement of Beethoven’s death, “L. v. Beethoven was born on December 16, 1770.”

[14] The mistake in the mother’s name is sufficiently explained by the use of Lena as the contraction of both Helena and Magdalena.

[15] “The baptismal certificate seems to be incorrect, since there was a Ludwig born before me. A Baumgarten was my sponsor, I believe. Ludwig van Beethoven.”

[16] “Allg. Mus.-Ztg.,” May 23. 1827.

[17] There was no teacher of this name in Bonn at the time. There was a Rupert, however, who may have been the one meant by Fischer.

[18] These memoirs are in manuscript. They were formerly in the possession of Dr. Bodifée of Bonn, later in the Town Hall.

[19] Error; Beethoven’s mother did not die until 1787, long after he had left school.

[20] Thayer’s characterization of the joyless boyhood of Beethoven may submit to a slight modification, at least so far as his childhood is concerned, without violence to the verities of history. Fischer would have us believe that the lad took part with his brother Carl in boyish capers which were not always of a harmless character. In a letter to Simrock, Court Councillor Krupp relates: “My father, who died in 1847, was a youthful friend and schoolmate of Ludwig and Carl van Beethoven, and distantly related to the godmother of the former. Thursdays were holidays for the schoolboys, and the brothers Beethoven, L. and C., were then wont to come to the house of my grandparents, No. 28 Bonngasse (now belonging to my sister and me), and amuse themselves, among other things, with target shooting. There was a wall between the garden of our house and the gardens of the adjoining houses in the Wenzelgasse against which the target was placed at which the boys shot arrows; a hit in the centre brought forth a _Stüber_ (about 4 pfennigs) for the lucky marksman. Garden and wall are now (1890) in the same condition as then. In the evening the Beethoven brothers went home through the Gudenauergässchen. The family lived at the time in the Wenzelgasse back of our house.” Here is an inaccuracy, for Ludwig van Beethoven no longer went to school when the Beethoven family changed their house in the Rheingasse for that in the Wenzelgasse--which was probably about 1785. The letter continues: “Ludwig’s father treated him harshly, especially when he was intoxicated, and sometimes shut him up in the cellar.”

[21] There seems to have been no knowledge on the part of Beethoven's biographers of this visit to Holland until Thayer brought the incident to notice. It is, therefore, highly significant that the Fischer family also recalled the circumstance and, besides, knew what brought it about. The sister of young Rovantini, who died in September, 1781, was employed as governess in Rotterdam, and on receiving intelligence of the death of her brother came to Bonn, together with her mistress (whose name has not been preserved), to visit his grave. For a month she was an inmate of the Beethoven house; there was a good deal of music-making and some excursions to neighboring places of interest, including Coblenz. The visitors invited the Beethoven family to make a trip to Holland. Inasmuch as Johann van Beethoven could not get away, the mother went with the lad, and, a party of five, they embarked upon the voyage. This must have been in October or November, 1781, which agrees with the story of the extreme cold encountered on the voyage. They remained a considerable time, but whether or not Ludwig gave a concert as he had intended, is not known. Despite the attentions showered upon him by the wealthy lady from Rotterdam and the many honors, the pecuniary results were disappointing. To Fischer's question how he had fared Beethoven is reported to have answered: "The Dutch are skinflints (_Pfennigfuchser_); I'll never go to Holland again."

Chapter IV

Beethoven a Pupil of Neefe--His Talent and Skill Put to Use--First Efforts at Composition--Johann van Beethoven's Family--Domestic Tribulations.

Christian Gottlob Neefe succeeded the persons mentioned as Beethoven's master in music. When this tutorship began and ended, and whether or not it be true that the Elector engaged and paid him for his services in this capacity, as affirmed by divers writers--here again positive evidence is wanting. Neefe came to Bonn in October, 1779; received the decree of succession to the position of Court Organist on February 15, 1781, and was thus permanently engaged in the Elector's service. The unsatisfactory nature of the earlier instruction, as well as the high reputation of Neefe, placed in the strongest light before the Bonn public by those proceedings which had compelled him to remain there, would render it highly desirable to Johann van Beethoven to transfer his son to the latter's care. It would create no surprise should proof hereafter come to light that this change was made even before the issue of the decree of February 15, 1781;--that even then the pupil was profiting by the lessons of the zealous Bachist. Whether this was so or not, it was more than ever necessary that the boy's talents should be put to profitable use, for the father found his family still increasing. The baptism of a daughter named Anna Maria Franciska after her sponsors Anna Maria Klemmers, _dicta_ Kochs, and Franz Rovantini, court musician, is recorded in the St. Remigius register February 23, 1779, and her death on the 27th of the same month. The baptism of August Franciscus Georgius van Beethoven--Franz Rovantini, _Musicus Aulicus_ and Helene Averdonk, _patrini_, follows nearly two years later--January 17, 1781. There is no minister of State now to lend his name to a child of Johann van Beethoven, nor any lady abbess. Rovantini, one of the youngest members of the orchestra (relative and friend of the family), and a Frau Kochs, the young contralto, whose musical education the father had superintended, take their places--another indication that the head of the family is gradually sinking in social position.

It is Schlosser who states that "the Elector urged Neefe to make it his particular care to look after the training of the young Beethoven." How much weight is to be attached to this assertion of a man who hastily threw a few pages together soon after the death of the composer, and who begins by adopting the old error of 1772 as the date of his birth, and naming his father "Anton," may safely be left to the reader. That the story may possibly have some foundation in truth is not denied; but the probabilities are all against it. Just in these years Max Friedrich is busy with his tric-trac, his balls, his new operettas and comedies, and with his notion of making the theatre a school of morals. The truth seems to be (and it is the only hypothesis that suggests itself, corresponding to the established facts), that Johann van Beethoven had now determined to make an organist of his son as the surest method of making his talents productive. The appointment of Neefe necessarily destroyed Ludwig's hope of being van den Eeden's successor; but Neefe's other numerous employments would make an assistant indispensable, and to this place the boy might well aspire. It will be seen in the course of the narrative that Beethoven never had a warmer, kinder and more valuable friend than Neefe proved throughout the remainder of his Bonn life; that, in fact, his first appointment was obtained for him through Neefe, although this is the first hint yet published that the credit does not belong to a very different personage. What, then, so natural, so self-evident as that Neefe, foreseeing the approaching necessity of some one to take charge of the little organ in the chapel at times when his duties to the Grossmann company would prevent him from officiating in person, should gladly undertake the training of the remarkable talents of van den Eeden's pupil with no wish for any other remuneration than the occasional services which the youth could render him?

NEEFE'S INFLUENCE ON BEETHOVEN

Dr. Wegeler remarks: “Neefe had little influence upon the instruction of our Ludwig, who frequently complained of the too severe criticisms made on his first efforts in composition.” The first of these assertions is evidently an utter mistake. In 1793 Beethoven himself, at all events, thought differently: “I thank you for the counsel which you gave me so often in my progress in my divine art. If I ever become a great man yours shall be a share of the credit. This will give you the greater joy since you may rest assured,” etc. Thus he wrote to his old teacher. As to the complaint of harsh criticism it may be remarked that Neefe, reared in the strict Leipsic school, must have been greatly dissatisfied with the direction which the young genius was taking under the influences which surrounded him, and that he should labor to change its course. He was still a young man, and in his zeal for his pupil’s progress may well have criticized his childish compositions with a severity which, though no more than just and reasonable, may have so contrasted with injudicious praise from other quarters as to wound the boy’s self-esteem and leave a sting behind; especially if Neefe indulged in a tone at all contemptuous, a common fault of young men in like cases. Probably, in some conversation upon this point Beethoven may have remarked to Wegeler that Neefe had criticized him in his childhood rather too severely.

But to return from the broad field of hypothesis to the narrow path of facts. “On this day, June 20, 1782,” Neefe writes of himself and the Grossmann company, “we entered upon our journey to Münster, whither the Elector also went. The day before my predecessor, Court Organist van den Eeden, was buried; I received permission, however, to leave my duties in the hands of a vicar and go along to Westphalia and thence to the Michaelmas fair at Frankfort.” The Düsseldorf documents prove that this vicar was Ludwig van Beethoven, now just eleven and a half years of age. In the course of the succeeding winter, Neefe prepared that very valuable and interesting communication to “Cramer’s Magazine” which has been so largely quoted. In this occurs the first printed notice of Beethoven, one which is honorable to head and heart of its author. He writes, under date of March 2, 1783:

Louis van Beethoven, son of the tenor singer mentioned, a boy of eleven years and of most promising talent. He plays the clavier very skilfully and with power, reads at sight very well, and--to put it in a nutshell--he plays chiefly “The Well-Tempered Clavichord” of Sebastian Bach, which Herr Neefe put into his hands. Whoever knows this collection of preludes and fugues in all the keys--which might almost be called the _non plus ultra_ of our art--will know what this means. So far as his duties permitted, Herr Neefe has also given him instruction in thorough-bass. He is now training him in composition and for his encouragement has had nine variations for the pianoforte, written by him on a march--by Ernst Christoph Dressler--engraved at Mannheim. This youthful genius is deserving of help to enable him to travel. He would surely become a second Wolfgang Amadeus Mozart were he to continue as he has begun.

This allusion to Mozart, who had not then produced those immortal works upon which his fame now principally rests, speaks well for the insight of Neefe and renders his high appreciation of his pupil’s genius the more striking. Had this man then really so little influence upon its development as Wegeler supposed?

That C. P. E. Bach’s works were included in Neefe’s course of instruction is rendered nearly certain by the following facts: he was himself a devout student of them; the only reference to his father made by Beethoven in all the manuscripts examined for this work, an official document or two excepted, is upon an unfinished copy of one of Bach’s cantatas in these words: “Written by my dear father;”[22] and one of the works most used by him in compiling his “Materialien für Contrapunkt” in 1809 was Bach’s “Versuch über die wahre Art das Clavier zu Spielen.” The unlucky remark of Wegeler, founded, too, possibly upon some expression of Beethoven’s in a moment of spleen, but certainly not in justice, has cast a shadow upon the relation between Neefe and his pupil. Writer after writer has copied without examining it. Does it bear examination? Possibly, if it be supposed to relate only to execution upon the pianoforte and organ; but in no other case. It is self-evident that serious study in the severe school of the Bachs was necessary to counteract the influence of the light and trivial music of the Bonn stage upon the young genius; and to Neefe the credit of seeing this and acting accordingly must be given. The reader’s attention is called particularly to the words “He is now training him in composition, and for his encouragement has had nine variations for the pianoforte written by him on a march by Dressler engraved at Mannheim,” in Neefe’s notice of Beethoven above cited, and the date of the article from which it is taken--March 2, 1783. Is it not perfectly clear that these variations have been recently composed, and very recently printed? Yet upon the title stands, “Par un jeune amateur, Louis van Beethoven, âgé de dix ans.” If this were a solitary case of apparent discrepancy between the boy’s age and the year given it would attract and deserve no notice; but it is one of many and adds its weight to the evidence of that falsification already spoken of.[23]

A second work belonging to this period is a two-part fugue in D for the organ.[24]

BEETHOVEN AS NEEFE’S ASSISTANT

To return to the young organist, who, since the publication of Wegeler's "Notizen," has always been supposed to have been placed at that instrument by the Elector Max Franz in the year 1785, as a method of giving him pecuniary aid without touching his feelings of pride and independence. The place of assistant to Neefe was no sinecure; although not involving much labor, it brought with it much confinement. The old organ had been destroyed by the fire of 1777, and a small chamber instrument still supplied its place. It was the constantly recurring necessity of being present at the religious services which made the position onerous.

On all Sundays and regular festivals (says the Court Calendar) high mass at 11 a.m. and vespers at 3 (sometimes 4) p.m. The vespers will be sung throughout in _Capellis solemnibus_ by the musicians of the electoral court, the middle vespers will be sung by the court clergy and musicians chorally as far as the _Magnificat_, which will be performed musically. On all Wednesdays in Lent the _Miserere_ will be sung by the chapel at 5 p.m. and on all Fridays the _Stabat mater_. Every Saturday at 3 p.m. the Litanies at the altar of Our Lady of Loretto. Every day throughout the year two masses will be read, the one at 9, the other at 11--on Sundays the latter at 10.

Such a programme gave the organist something at least to do, and when Neefe left Bonn for Münster, June 20, 1782, he left his pupil no easy task. Before the close of the theatrical season of the next winter (1782-'83) the master was obliged to call upon the boy for still farther assistance. "In the winter of 1784," writes the widow Neefe, "my husband of blessed memory was temporarily entrusted with the direction of the church music as well as other music at court while the Electoral Chapelmaster L. was absent on a journey of several months." The date is wrong, for Lucchesi's petition for leave of absence was granted April 26, 1783. Thus overwhelmed with business, Neefe could no longer conduct at the pianoforte the rehearsals for the stage, and Ludwig van Beethoven, now 12 years old, became also "cembalist in the orchestra." In those days every orchestra was provided with a harpsichord or pianoforte, seated at which the director guided the performance, playing from the score. Here, then, was in part the origin of that marvellous power, with which in later years Beethoven astonished his contemporaries, of reading and playing the most difficult and involved scores at first sight. The position of cembalist was one of equal honor and responsibility. Handel and Matthison's duel grew out of the fact that the former would not leave the harpsichord on a certain occasion before the close of the performance. Gassmann placed the young Salieri at the harpsichord of the Imperial Opera House as the best possible means of training him to become the great conductor that he was. This was the high place of honor given to Haydn when in London. In Ludwig van Beethoven's case it was the place in which he, as Mosel says of Salieri, "could make practical use of what he learned from books and scores at home." Moreover, it was a place in which he could, even in boyhood, hear to satiety the popular Italian, French and German operas of the day and learn to feel that something higher and nobler was necessary to touch the deeper feelings of the heart; a place which, had the Elector lived ten years longer, might have given the world another not merely great but prolific, nay inexhaustible, operatic composer. The cembalist's duties doubtless came to an end with the departure of the Elector for Münster in May or June, and he then had time for other pursuits, of which composition was one. A song, "Schilderung eines Mädchens," by him was printed this year in Bossler's "Blumenlese für Liebhaber," and a Rondo in C for pianoforte, anonymous, which immediately follows, was also of his composition. A more important work, which before the close of the year was published by Bossler with a magniloquent dedication to Max Friedrich, was the three sonatas for pianoforte, according to the title, if true, "composed by Ludwig van Beethoven, aged 11 years."[25] The reader can judge whether or not the 11 should be 12.

To turn for a moment to the Beethoven family matters. This summer (1783) had brought them some sorrow again. The child Franz Georg, now just two and a half years old, died August 16th. This was another stroke of bad fortune which not only wounded the heart but added to the pecuniary difficulties of the father, who was now losing his voice and whose character is described in an official report made the next summer by the words "of tolerable conduct." If the duties of Neefe during the last season had been laborious, in the coming one, 1783-'84, they were still more arduous. It was the first under the new contract by which the Elector assumed all the costs of the theatre, and a woman, Mme. Grossmann, had the direction. It was all-important to singers, actors and whoever was concerned that the result of the experiment should be satisfactory to their employer; and as the opera was more to his taste than the spoken drama, so much the more difficult was Neefe's task. Besides his acting as chapelmaster in the place of Lucchesi, still absent, there was "every forenoon rehearsal of opera," as Mme. Grossmann wrote to Councillor T., at which, of course, Neefe had to be present. There was ever new music to be examined, arranged, copied, composed--what not?--all which he must attend to; in short, he had everything to do which could be imposed upon a theatrical music director with a salary of 1,000 florins. It therefore became a busy time for his young assistant, who still had no recognition as member of the court chapel, not even as "accessist"--the last "accessist" organist was Meuris (1778)--and consequently no salary from the court. But he had now more than completed the usual year of probation to which candidates were subjected, and his talents and skill were well enough known to warrant his petition for an appointment. The petition has not been discovered; but the report made upon it to the privy council has been preserved, together with the following endorsement: "High Lord Steward Count von Salm, referring to the petition

of Ludwig van Beethoven for the position of Assistant Court Organist, is of the humble opinion that the grace ought to be bestowed upon him, together with a small compensation." This endorsement is dated "Bonn, February 29, 1784." The report upon the petition is as follows:

APPOINTED ASSISTANT COURT ORGANIST

Most Reverend Archbishop and Elector, Most Gracious Lord, Lord.

Your Electoral Grace has graciously been pleased to demand a dutiful report from me on the petition of Ludwig van Beethoven to Your Grace under date the 15th inst.

Obediently and without delay (I report) that suppliant's father was for 29 years, his grandfather for 46, in the service of Your Most Reverend Electoral Grace and Your Electoral Grace's predecessors; that the suppliant has been amply proved and found capable to play the court organ as he has done in the absence of Organist Neefe, also at rehearsals of the plays and elsewhere and will continue to do so in the future; that Your Grace has graciously provided for his care and subsistence (his father no longer being able to do so). It is therefore my humble judgment that for these reasons the suppliant well deserves to have graciously bestowed upon him the position of assistant at the court organ and an increase of remuneration. Commending myself to the good will of Your Most Reverend Electoral Grace I am Your Most Reverend Grace's

most humble and obedient servant

Sigismund Altergraff zu Salm und Reifferscheid.

Bonn, February 23, 1784.

The action taken is thus indicated:

Ad Sup.

Ludwig van Beethoven.

On the obedient report the suppliant's submissive prayer, granted. (_Beruhet._)

Bonn, February 29, 1784.

Again, on the cover:

Ad sup.

Lud. van Beethoven, Granted. (_Beruhet._)

Sig. Bonn, February 29, 1784.

The necessity of the case, the warm recommendation of Salm-Reifferscheid, very probably, too, the Elector's own knowledge of the fitness of the candidate, and perhaps the flattery in the dedication of the sonatas--for these were the days when dedications but half disguised petitions for favor--were sufficient inducements to His Transparency at length to confirm the young organist in the position which Neefe's kindness had now for nearly two years given him. Opinions differ as to the precise meaning of the word _Beruhet_ (translated "granted" in the above transcripts); but this much is certain: Beethoven was not appointed assistant organist in 1785 by Max Franz at the instance of Count Waldstein, but at the age of 13 in the spring of 1784 by Max Friedrich, and upon his own petition supported by the influence of Neefe and of Salm-Reifferscheid.

The appointment was made, but the salary had not been determined on when an event occurred which wrought an entire change in the position of theatrical affairs at Bonn:--the Elector died on April 15, and the theatrical company was dismissed with four weeks' wages. There was no longer a necessity for a second organist; and fortunate it was for the assistant that his name came before Max Friedrich's successor (in the reports soon to be copied) as being a regular member of the court chapel, although "without salary." Lucchesi returned to Bonn; Neefe had nothing to do but play his organ, cultivate his garden outside the town and give music lessons. It was long before such a conjunction of circumstances occurred as would have led the economical Max Franz to appoint an organist adjunct. Happy was it, therefore, that one of the deceased Elector's last acts secured young Beethoven the place.

EARLY EFFORTS AT COMPOSITION

The excellent Frau Karth, born in 1780, could not recall to memory any period of her childhood down to the death of Johann van Beethoven, when he and his family did not live in the lodging above that of her parents. This fact, together with the circumstance that no mention is made of the Beethovens in the account of the great inundation of the Rhine in February, 1782, when all the families dwelling in the Fischer house of the Rheingasse were rescued in boats from the windows of the first story, added to the strong probability that Beethoven's position was but the first formal step of the regular process of confirming an appointment already determined upon;--these points strongly suggest the idea that to Ludwig's advancement his father owed the ability to dwell once more in a better part of the town, i.e., in the pleasant house No. 462 Wenzelgasse. The house is very near the Minorite church, which contained a good organ, concerning the pedal measurements of which, as we have seen, Beethoven made a memorandum in a note-book which he carried with him to Vienna.[26] In the "Neuen Blumenlese für Klavierliebhaber" of this year, Part I, pp. 18 and 19, appeared a Rondo for Pianoforte, in A major, "dal Sig^{re} van Beethoven"[27]; and Part II, p. 44, the Arioso "An einen Säugling, von Hrn. Beethoven."[28] "Un Concert pour le Clavecin ou Fortepiano composé par Louis van Beethoven âgé de douze ans," 32 pp. manuscript written in a boy's hand, may also belong to this year[29]; and, judging by the handwriting, to the period may also be assigned a movement in three parts of four pages, formerly in the Artaria collection, without title, date or remark of any kind.[30]

The widow Karth perfectly remembered Johann van Beethoven as a tall, handsome man with powdered head. Ries and Simrock described Ludwig to Dr. Müller "as a boy powerfully, almost clumsily built."[31] How easily fancy pictures them--the tall man walking to chapel or rehearsal with the little boy trotting by his side, through the streets of Bonn, and the gratified expression of the father as the child takes the place and performs the duties of a man!

FOOTNOTES:

[22] "Morgengesang am Schöpfungstage."

[23] As given by Nottebohm in his catalogue (p. 154) the title of the original publication of the Variations by Goetz of Mannheim ran as follows: "_Variations pour le Clavecin sur une Marche de Mr. Dressler, composées et Dediées à son Excellence Madame la Comtesse de Wolfmetternich, née Baronne d'Assebourg, par un jeune amateur Louis van Beethoven, âgé de dix ans. 1780._" Inasmuch as Nottebohm's Notes on Thayer's "Chronologisches Verzeichniss" do not give the date 1780, it was probably appended by mistake. In the _delle Sinfonie, etc., che si trovanno in manoscritto nella officina de Breitkopf in Lipsia_, under the compositions of 1782, 1783 and 1784: _Variations da Louis van Beethoven, âgé de dix ans, Mannheim_, with the theme in notation. The Countess Wolff-Metternich, to whom the variations are dedicated, was the wife of Count Ignaz von Wolff-Metternich, "Konferenzmeister" and president of the High Court of Appeals, who died in Bonn, March 15, 1790. Ernst Christoph Dressler, composer of the theme varied by Beethoven, was an opera singer in Cassel.

[24] The Bagatelles for Pianoforte, Op. 33. included by Thayer in his MSS. and his "Chronologisches Verzeichniss" as also belonging to this period on the strength of their superscription on a manuscript copy, "Louis van Beethoven ... 1782," were, as Nottebohm has shown, not composed at this time. One of them was composed in 1802 and another sketched between 1799 and 1801. See Nottebohm ("Zweite Beethoveniana," p. 250). Nottebohm conjectures that the organ fugue was composed at his trial for the post of second court organist. In view of the fact that his age was falsified by his father at this time, it is likely that the work was composed in 1783.

[25] Title of the original publication: "Drei Sonaten für Klavier, dem Hochwürdigsten Erzbischofe und Kurfürsten zu Köln, Maximilian Friedrich meinem gnädigsten Herrn gewidmet und verfertigt von Ludwig van Beethoven, alt eilf Jahr." Beethoven wrote on a copy of the sonatas: "These Sonatas and the Variations of Dressler are my first works." He probably meant his first published works. See Thayer's "Chronologisches Verzeichniss," p. 2, 183.

[26] The editor has here thought it advisable to permit Thayer's original text to stand in the body of the book, although Dr. Deiters made a radical correction in his revision of the first volume of the biography. On the basis of the Fischer manuscript Dr. Deiters relates that the Beethoven family lived in the house in the Rheingasse at the time of the inundation; that Beethoven's mother sought to stay the alarm of the inmates with encouraging words, but at the last had to make her escape with the others into the Giergasse over boards and down ladders. Admitting that there are many inaccuracies in the recital, Dr. Deiters nevertheless accepts it in this particular and conjectures that Beethoven lived in the house in the Rheingasse until 1785.

[27] B. and H. Ges. Ausg. Serie 18, No. 196.

[28] B. and H. Ges. Ausg. Serie 23, No. 229.

[29] The manuscript contains the solo part complete with the orchestral preludes and interludes in transcription for pianoforte. There are indications that it was scored for small orchestra--strings, flutes and horns only. The composition was long unknown. Thayer included it in his “Chronologisches Verzeichniss” under No. 7, giving the themes. Guido Adler edited it at a much later date, and it has been published in the supplement to the collected works of Beethoven.

[30] Nottebohm conjectured that the movement referred to by Thayer was that for a musical clock, No. 29, in Thayer’s chronological catalogue, there described as a duo. Dr. Deiters thinks that it was a fragment of a composition for pianoforte and violin, No. 131 in the catalogue of the Artaria collection. It contains suggestions of Beethoven’s style, but the manuscript is a copy, not an autograph, and its authenticity is not proven.

[31] In the Fischer MS.: “Short of stature, broad shoulders, short neck, large head, round nose, dark brown complexion; he always bent forward slightly when he walked. In the house he was called der Spagnol (the Spaniard).”

Chapter V

Maria Theresia--Appearance and Character of Elector Max Franz--Musical Culture in the Austrian Imperial Family--A Royal Violinist--His Admiration for Mozart--His Court Music.

Maria Theresia was a tender mother, much concerned to see all her children well provided for in her lifetime and as independent as possible of her eldest son, the heir to the throne. This wish had already been fulfilled in the case of several of them.... The youngest son, Maximilian (born in Vienna, December 8, 1756), was already chosen coadjutor to his paternal uncle, Duke Karl of Lorraine, Grand Master of the Teutonic Order. But to provide a more bountiful and significant support, Prince Kaunitz formulated a plan which pleased the maternal heart of the monarch, and whose execution was calculated to extend the influence of the Court of Vienna in the German Empire. It was to bestow more ecclesiastical principalities upon the Archduke Maximilian. His eyes fell first upon the Archbishopric and Electorate of Cologne and the Archbishopric and Principality of Münster. These two countries had one and the same Regent, Maximilian Friedrich, descended from the Suabian family of Königseck-Rothenfels, Counts of the Empire. In view of the advanced age of this ruler his death did not seem far distant; but it was thought best not to wait for that contingency, but to secure the right of succession at once by having the Archduke elected Coadjutor in Cologne and Münster. Their possession was looked upon as a provision worthy of the son of an Empress-Queen. As Elector and Lord of the Rhenish shore, simultaneously co-director of the Westphalian Circuit (a dignity associated with the archbishopric of Münster), he could be useful to his house, and oppose the Prussian influence in the very part of Germany where it was largest.

Thus Dohm begins the seventh chapter of his “Denkwürdigkeiten” where, in a calm and passionless style, he relates the history of the intrigues and negotiations which ended in the election of Maria Theresia’s youngest son on August 7, 1780, as coadjutor to the Elector of Cologne and, on the 16th of the same month, to that of Münster, and secured him the peaceful and immediate succession when Max Friedrich’s functions should cease. The news of the election at Cologne reached Bonn on the same day about 1 o’clock p. m. The Elector proceeded at once to the Church of the Franciscans (used as the chapel since the conflagration of 1777), where a “musical ‘Te Deum’” was sung, while all the city bells were ringing. Von Kleist’s regiment fired a triple salvo, which the cannon on the city walls answered. At noon a public dinner was spread in the palace, one table setting 54, another 24 covers. In the evening at 8-1/2 o’clock, followed the finest illumination ever seen in Bonn, which the Elector enjoyed riding about in his carriage. After this came a grand supper of 82 covers, then a masked ball “to which every decently clad subject as well as any stranger was admitted, and which did not come to an end till nearly 7 o’clock.”

MAX FRANZ, THE NEW ELECTOR

Max Franz was in his twenty-eighth year when he came to Bonn. He was of middle stature, strongly built and already inclining to that corpulence which in his last years made him a prodigy of obesity. If all the absurdities of his eulogists be taken for truth, the last Elector of Cologne was endowed with every grace of mind and character that ever adorned human nature. In fact, however, he was a good-looking, kindly, indolent, somewhat choleric man; fond of a joke; affable; a hater of stiff ceremony; easy of access; an honest, amiable, conscientious ruler, who had the wisdom and will to supply his own deficiencies with enlightened and skilful ministers, and the good sense to rule, through their political foresight and sagacity, with an eye as much to the interests of his

subjects as his own.

In his boyhood he was rather stupid. Swinburne dismisses him in two lines: “Maximilian is a good-natured, neither here-nor-there kind of youth.” The brilliant, witty, shrewdly observant Mozart wrote to his father (Nov. 17, 1781): “To whom God gives an office he also gives an understanding. This is really the case with the Archduke. Before he became a priest he was much wittier and more intellectual and talked less, but more sensibly. You ought to see him now! Stupidity looks out of his eyes; he talks eternally, always in falsetto; he has a swollen neck--in a word, the man is completely transformed.” His mother had supplied him with the best instructors that Vienna afforded, and had sent him travelling pretty extensively for an archduke in those days. One of his journeys was to visit his sister Marie Antoinette in Paris, where his awkwardness and breaches of etiquette caused as much amusement to the anti-Austrian party as they did annoyance to the Queen, and afterwards to his brother Joseph, when they came to his ears.

In 1778 he was with Joseph in the campaign in Bavaria. An injury to his knee, caused by a fall of his horse, is the reason alleged for his abandonment of a military career; upon which he was prevailed upon, so the “Historisches Taschenbuch” (II, Vienna, 1806) expresses it, to become a candidate for the Coadjutorship of Cologne. If he had to be “prevailed upon” to enter the church, the more to his credit was the course he pursued when once his calling and election were sure.

The rigid economy which he introduced at court immediately after his accession in 1784 gave rise to the impression that he was penurious. It may be said in his defence that the condition of the finances required retrenchment and reform; that he was simple in his tastes and cared nothing for show and magnificence, except upon occasions when, in his opinion, the electoral dignity required them. Then, like his predecessors, he was lavish. His personal expenses were not great, and he waited until his revenues justified it before he indulged to any great extent his passion for the theatre, music and dancing (stout as he was, he was a passionate dancer), and his table. He was, through the nature of his physical constitution, an enormous eater, though his drink was only water.

The influence of a ruler upon the tone and character of society in a small capital is very great. A change for the better had begun during the time of Max Friedrich, but under his successor a new life entered Bonn. New objects of ambition were offered to the young men. The church and cloister ceased to be all in all. One can well understand how Wegeler in his old age, as he looked back half a century to the years when he was student and professor--and _such_ a half-century, with its revolutionary and Napoleonic wars, its political, religious and social changes!--should write (“Notizen,” p. 59): “In fact, it was a beautiful and in many ways active period in Bonn, so long as the genial Elector, Max Franz, Maria Theresia’s youngest son and favorite, reigned there.” How strongly the improved tone of society impressed itself upon the characters of the young is discernible in the many of them who, in after years, were known as men of large and liberal ideas and became distinguished as jurists, theologians and artists, or in science and letters. These were the years of Beethoven’s youth and early manhood; and though his great mental powers were in the main exercised upon his art, there is still to be observed through all his life a certain breadth and grandeur in his intellectual character, owing in part, no doubt, to the social influences under which it was developed.

It is highly honorable to the young Max Franz that he refused to avail himself of a privilege granted him in a Papal bull obtained for him by his mother--that of deferring the assumption of priestly vows for a period of ten years--but chose rather, as soon as he had leisure for the step, to enter the seminary in Cologne to fit himself for consecration. He entered November 29, rigidly submitted himself to all the discipline of the institution for the period of eight days, when, on December 8, the nuntius, Bellisoni, ordained him sub-deacon; after another eight days, on the 16th, deacon; and on the 21st, priest; thus showing that if there be no royal road to mathematics, there is a railway with express train for royal personages in pursuit of ecclesiastical science. Returning to Bonn, he read his first mass on Christmas eve in the Florian Chapel.

The cause of science and education the Elector had really at heart. In 1785 he had established a botanic garden; now he opened a public reading room in the palace library and sent a message to the theological school in Cologne, that if the improved course of instruction adopted in Austria was not introduced, he should found other seminaries. On the 26th of June he was present at the opening of a normal school; and on August 9th came the decree raising the Bonn Hochschule to the rank of a university by authority of an Imperial diploma.

Upon the suppression of the Jesuits in 1774, Max Friedrich devoted their possessions and revenues to the cause of education. New professorships were established in the gymnasium and in 1777 an “Academy” was formed. This was the first step; the second was to found an independent institution called the Lyceum; and at his death an application was before the Emperor for a university charter. Max Franz pushed the matter, obtained the charter from his brother, and Monday, the 20th of November, 1786, was the day appointed for the solemn inauguration of the new institution. The Court Calendar for the next year names six professors of

theology, six of jurisprudence, civil and ecclesiastical, four of medicine, and ten of philology and other branches of learning. In later editions new names are added; in that of 1790, Wegeler is professor of midwifery.

Though economical, Max Franz drew many a man of superior abilities--men of letters and artists--to Bonn; and but for the bursting of the storm which was even then gathering over the French border, his little capital might well have had a place in German literary history not inferior to that of Weimar. Nor are instances wanting in which he gave generous aid to young talent struggling with poverty; though that he did so much for Beethoven as is usually thought is, at least, doubtful.

This man, not a genius, not overwhelmingly great mentally, nor, on the other hand, so stupid as the stories told of his boyhood seem to indicate, but honest, well-meaning, ready to adopt and enforce wise measures devised by skilful ministers; easy, jocose and careless of appearances, very fond of music and a patron of letters and science,--this man, to whom in that period of vast intellectual fermentation the Index Expurgatorius was a dead letter, gave the tone to Bonn society.

A GIFTED IMPERIAL FAMILY

That solid musical education which she had received from her father, Maria Theresia bestowed upon her children, and their attainments in the art seem to have justified the time and labor spent. In 1749, at the age of seven and six, Christina and Maria Elizabeth took part in one of the festive musical pieces; Marie Antoinette was able to appreciate Gluck and lead the party in his favor in later years at Paris. Joseph is as much known in musical as in civil and political history. When Emperor he had his daily hour of music in his private apartments, playing either of several instruments or singing, according to the whim of the moment; and Maximilian, the youngest, acquired a good degree of skill both in singing and in the treatment of his favorite instrument, the viola. Beethoven once told Schindler that the Elector thought very highly of Mattheson. In his reminiscences of a visit to Vienna in 1783, J. F. Reichardt gives high praise to the musical interest, skill and zeal of Emperor Joseph and his brother Archduke Maximilian, and a writer in “Cramer’s Magazine,” probably Neefe, tells of a “remarkable concert” which took place at court in Bonn on April 5, 1786, at which the Elector played the viola, Duke Albrecht the violin, “and the fascinating Countess Belderbusch the clavier most charmingly.”

Maximilian had become personally acquainted with Mozart in Salzburg in 1775, where the young composer had set Metastasio’s “Il Re pastore” to music to be performed in his honor (April 23rd); from which time, to his credit be it said, he ever held the composer and his music in kindest remembrance. When in 1781 Mozart determined to leave his brutal Archbishop of Salzburg and remain in Vienna, the Archduke showed at all events a desire to aid him.

Yesterday (writes the composer November 17, 1781) the Archduke Maximilian summoned me to him at 3 o’clock in the afternoon. When I entered he was standing before a stove in the first room awaiting me. He came towards me and asked if I had anything to do to-day? “Nothing, Your Royal Highness, and if I had it would always be a grace to wait upon Your Royal Highness.” “No; I do not wish to constrain anyone.” Then he said that he was minded to give a concert in the evening for the Court of Wurtemberg. Would I play something and accompany the aria? I was to come to him again at 6 o’clock. So I played there yesterday.

Mozart was everything to him (continues Jahn); he signalized him at every opportunity and said, if he were Elector of Cologne, Mozart would surely be his chapelmaster. He had also suggested to the Princess (of Wurtemberg) that she appoint Mozart her music teacher, but received the reply that if it rested with her she would have chosen him; but the Emperor--“for him there is nobody but Salieri!” cries out Mozart peevishly--had recommended Salieri because of the singing, and she had to take him, for which she was sorry.

Jahn gives no reason why Mozart was not engaged for Bonn. Perhaps he would have been had Lucchesi resigned in consequence of the reduction of his salary; but he kept his office of chapelmaster and could not well be dismissed without cause. Mattioli’s resignation was followed by the call of Joseph Reicha to the place of concertmaster; but for Mozart no vacancy occurred at that time. Maximilian was in Vienna during most of the month of October, 1785, and may have desired to secure Mozart in some way, but just at that time the latter was, as his father wrote, “over head and ears busy with the opera ‘Le Nozze di Figaro.’” Old Chapelmaster Bono could not live much longer; which gave him hope, should the opera succeed, of obtaining a permanent appointment in Vienna; and, in short, his prospects seemed just then so good that his determination--if he should really receive an offer from the Elector--to remain in the great capital rather than to take his young wife so far away from home and friends as the Rhine then was, and, in a manner, bury himself in a small town where so few opportunities would probably be given him for the exercise of the vast powers which he was conscious of possessing, need not surprise us.

Was it the good or the ill fortune of the boy Beethoven that Mozart came not to Bonn? His marvellous original talents were thus left to be developed without the fostering care of one of the very greatest of musical geniuses, and one of the profoundest of musical scholars; but on the other hand it was not oppressed, perhaps crushed, by daily intercourse with that genius and scholarship.

Maximilian, immediately after reaching Bonn as Elector, ordered full and minute reports to be made out concerning all branches of the administration, of the public and court service and of the cost of their maintenance. Upon these reports were based his arrangements for the future. Those relating to the court music are too important and interesting to be overlooked, for they give us details which carry us instantly into the circle which young Beethoven has just entered and in which, through his father's connection with it, he must from earliest childhood have moved. They are three in number, the first being a list of all the individuals constituting the court chapel; the second a detailed description of the singers and players, together with estimates of their capabilities; the third consists of recommendations touching a reduction in salaries. A few paragraphs may be presented here as most intimately connected with significant personages in our history; they are combined and given in abstract from the first two documents. Among the tenors we find

FATHER AND SON IN THE COURT CHAPEL

J. van Beethoven, age 44, born in Bonn, married; his wife is 32 years old, has three sons living in the electorate, aged 13, 10 and 8 years, who are studying music, has served 28 years, salary 315 fl. "His voice has long been stale, has been long in the service, very poor, of fair deportment and married."

Among the organists:

Christian Gottlob Neefe, aged 36, born at Chemnitz; married, his wife is 32, has served 3 years, was formerly chapelmaster with Seiler; salary 400 fl. "Christian Neffe, the organist, in my humble opinion might well be dismissed, inasmuch as he is not particularly versed on the organ, moreover is a foreigner, having no _Meritten_ whatever and of the Calvinistic religion."

Ludwig van Beethoven, aged 13, born at Bonn, has served 2 years, no salary. "Ludwig Betthoven, a son of the Betthoven sub No. 8, has no salary, but during the absence of the chapelmaster Luchesy he played the organ; is of good capability, still young, of good and quiet deportment and poor."

One of the items of the third report, proposing reductions of salaries and removals, has a very special interest as proving that an effort was made to supplant Neefe and give the post of court organist to young Beethoven. It reads:

Item. If Neffe were to be dismissed another organist would have to be appointed, who, if he were to be used only in the chapel could be had for 150 florins, the same is small, young, and a son of a court _musici_, and in case of need has filled the place for nearly a year very well.

The attempt to have Neefe dismissed from the service failed, but a reduction of his salary to the pittance of 200 florins had already led him to look about him to find an engagement for himself and wife in some theatre, when Maximilian, having become acquainted with his merits (notwithstanding his Calvinism), restored his former allowance by a decree dated February 8, 1785. When Joseph Reicha came to Bonn in Mattioli's place is still undetermined with exactness; but a decree raising him from the position of concertmaster to that of concert director, and increasing his salary to 1,000 florins, bears date June 28, 1785. In the general payroll of this year Reicha's salary is stated to be 666 thalers 52 alb., "tenorist Beethoven's" 200 th., "Beethoven jun." 100 th.

Chapter VI

Beethoven Again--The Young Organist--A First Visit to Vienna--Death of Beethoven's Mother--Sympathetic Acquaintances--Dr. Wegeler's "Notizen"--Some Questions of Chronology.

Schindler records--and on such points his testimony is good--that he had heard Beethoven attribute the marvellous development of Mozart's genius in great measure to the "consistent instruction of his father," thus implying his sense of the disadvantages under which he himself labored from the want of regular and systematic musical training through the period of his childhood and youth.[32] It is, however, by no means certain that had Ludwig van Beethoven been the son of Leopold Mozart, he would ever have acquired that facility of expression which enabled Wolfgang Mozart to fill up the richest and most varied scores almost as rapidly as his pen could move, and so as hardly to need correction--as if the development of musical idea was to him a work of mere routine, or perhaps, better to say, of instinct. _Poeta nascitur, non fit_, not only in respect to his thoughts but to his power of clothing them in

language. Many a man of profoundest ideas can never by any amount of study and practice acquire the art of conveying them in a lucid and elegant manner. On the other hand there are those whose thoughts never rise above the ordinary level, but whose essays are very models of style. Handel said of the elder Telemann, that he could compose in eight parts as easily as he (Handel) could write a letter; and Handel's own facility in composition was something astonishing. Beethoven, on the contrary, as his original scores prove, earned his bread by the sweat of his brow. But no amount of native genius can compensate for the want of thorough training. If, therefore, it be true that nature had in some degree limited his powers of expressing his musical as well as his intellectual ideas, so much greater was the need that, at the age which he had now reached, he should have opportunity to prosecute uninterruptedly a more profound and systematic course of study. Hence, the death of Maximilian Friedrich, which must have seemed to the Beethovens at first a sad calamity, proved in the end a blessing in disguise; for while it did not deprive the boy of the pecuniary benefits of the position to which he had just been appointed, it gave him two or three years of comparative leisure, uninterrupted save by his share of the organist's duties, for his studies, which there is every reason to suppose he continued under the guidance of his firm friend Neefe.

These three years were a period of theatrical inactivity in Bonn. For the carnival season of 1785, the Elector engaged Böhm and his company, then playing alternately at Cologne, Aix-la-Chapelle and Düsseldorf. This troupe during its short season may have furnished the young organist with valuable matter for reflection, for in the list of newly studied pieces, from October 1783 to the same month 1785--thus including the engagement in Bonn--are Gluck's "Alceste" and "Orpheus," four operas of Salieri (the "Armida" among them), Sarti's "Fra due Litiganti" and "L'Incognito" in German translation, Holzbauer's "Günther von Schwarzburg" and five of Paisiello's operas. These were, says the report in the "Theater-Kalender" (1786), "in addition to the old and familiar French operettas, 'Zémire et Azor,' 'Sylvain,' 'Lucile,' 'Der Prächtige,' 'Der Hausfreund,' etc., etc." The three serious Vienna operas, "Alceste," "Orpheus" and "Armida," in such broad contrast to the general character of the stock pieces of the Rhenish companies, point directly to Maximilian and the Bonn season. The elector of Hesse-Cassel, being then in funds by the sale of his subjects to George III for the American Revolutionary War just closed, supported a large French theatrical company, complete in the three branches of spoken and musical drama and ballet. Max Franz, upon his return from Vienna in November, 1785, spent a few days in Cassel, and, upon the death of the Elector and the dismissal of the actors, a part of this company was engaged to play in Bonn during January and February, 1786. The performances were thrice a week, Monday, Wednesday and Saturday, and, with but two or three exceptions, consisted of a comedy, followed by a light opera or operetta. The list contains eight of Grétry's compositions, three by Desaides, two by Philidor, and one each by Sacchini, Champein, Pergolesi, Gossec, Frizieri, Monsigny and Schwarzendorf (called Martini)--all of light and pleasing character, and enjoying then a wide popularity not only in France but throughout the Continent.

Meantime Grossmann had left Frankfort and with Klos, previously a manager in Hamburg, had formed a new company for the Cologne, Bonn and Düsseldorf stages. This troupe gave the Carnival performances in 1787, confining them, so far as appears, to the old round of familiar pieces.

Each of these companies had its own music director. With Böhm was Mayer, composer of the "Irrlicht" and several ballets; with the French company Jean Baptiste Rochefort was "music-master"; and Grossmann had recently engaged Burgmüller, of the Bellomo company, composer of incidental music for "Macbeth." Hence, during these years, Neefe's public duties extended no farther than his service as organist, for Lucchesi and Reicha relieved him from all the responsibilities of the church and concert-room.

That the organ service was at this time in part performed by the assistant organist is a matter of course; there is also an anecdote, related by Wegeler on the authority of Franz Ries, which proves it. On Tuesday, Friday and Saturday of Holy Week, portions of the Lamentations of Jeremiah were included in the chapel service, recited by a single voice, accompanied on the pianoforte (the organ being interdicted) to the familiar Gregorian chant tune.

THE BOY ORGANIST CONFOUNDS A SINGER

On one occasion, in the week ending March 27, 1785, the vocalist was Ferdinand Heller, too good a musician to be easily disconcerted, the accompanist Ludwig van Beethoven, now in his fifteenth year. While the singer delivered the long passages of the Latin text to the reciting note the accompanist might indulge his fancy, restricted only by the solemnity fitted to the service. Wegeler relates that Beethoven

asked the singer, who sat with unusual firmness in the tonal saddle, if he would permit him to throw him out, and utilized the somewhat too readily granted permission to introduce so wide an excursion in the accompaniment while persistently striking the

reciting note with his little finger, that the singer got so bewildered that he could not find the closing cadence. Father Ries, the first violinist, then Music Director of the Electoral Chapel, still living, tells with details how Chapelmaster Lucchesi, who was present, was astonished by Beethoven's playing. In his first access of rage Heller entered a complaint against Beethoven with the Elector, who commanded a simpler accompaniment, although the spirited and occasionally waggish young prince was amused at the occurrence. Schindler adds that Beethoven in his last years remembered the circumstance, and said that the Elector had "reprimanded him very graciously and forbidden such clever tricks in the future."

The date is easily determined: In Holy Week, 1784, neither Maximilian nor Lucchesi was in Bonn; in 1786 Beethoven's skill would no longer have astonished the chapelmaster. Of the other characteristic anecdotes related of Beethoven's youth there is not one which belongs to this period (May, 1784-April, 1787), although some have been attributed to it by previous writers.

Nothing is to be added to the record already made except that, on the authority of Stephan von Breuning, the youth was once a pupil of Franz Ries on the violin, which must have been at this time; that, according to Wegeler, his composition of the song "Wenn Jemand eine Reise thut"[33] fell in this period, and that he wrote three pianoforte quartets, the original manuscript of which bore the following title: "Trois Quatuors pour Clavecin, violino, viola e basso. 1785. Composé par (de L.) Louis van Beethoven, âgé 13 ans."[34] The reader will remark and understand the discrepancy here between the date and the author's age. Were these quartets intended for publication and for dedication to Max Franz, as the sonatas had been for Max Friedrich? During their author's life they never saw the light, but their principal themes, even an entire movement, became parts of future works. They were published in 1832 by Artaria and appear as Nos. 75 and 77, Series 10, in the Complete Works.

One family event is recorded in the parish register of St. Remigius--the baptism of Maria Margaretha Josepha, daughter of Johann van Beethoven, on May 5, 1786.

There is a letter from Bonn, dated April 8, 1787, in "Cramer's Magazine" (II, 1385), which contains a passing allusion to Beethoven. It affords another glimpse of the musical life there:

Our residence city is becoming more and more attractive for music-lovers through the gracious patronage of our beloved Elector. He has a large collection of the most beautiful music and is expending much every day to augment it. It is to him, too, that we owe the privilege of hearing often virtuosi on various instruments. Good singers come seldom. The love of music is increasing greatly among the inhabitants. The pianoforte is especially liked; there are here several _Hammerclaviere_ by Stein of Augsburg, and other correspondingly good instruments.... The youthful Baron v. Gudenau plays the pianoforte right bravely, and besides young Beethoven, the children of the chapelmaster deserve to be mentioned because of their admirable and precociously developed talent. All of the sons of Herr v. Mastiaux play the clavier well, as you already know from earlier letters of mine.

"This young genius deserves support to enable him to travel," wrote Neefe in 1783. In the springtime of 1787 the young "genius" was at length enabled to travel. Whence or how he obtained the means to defray the expenses of his journey, whether aided by the Elector or some other Mæcenas, or dependent upon the small savings from his salary and--hardly possible--from the savings from his music lessons painfully and carefully hoarded for the purpose, does not appear. The series of papers at Düsseldorf is at this point broken; so that not even the petition for leave of absence has been discovered. The few indications bearing on this point are that he had no farther aid from the Elector than the continued payment of his salary. What is certain is that the youth, now sixteen, but passing for a year or two younger, visited Vienna, where he received a few lessons from Mozart (Ries, in "Notizen," page 86); that his stay was short, and that on his way home he was forced to borrow some money in Augsburg.

When he made the journey is equally doubtful. Schindler was told by some old acquaintances of Beethoven "that on the visit two persons only were deeply impressed upon the lifelong memory of the youth of sixteen years: the Emperor Joseph and Mozart." If the young artist really had an interview with the Emperor it must have occurred before the 11th of April, or after the 30th of June, for those were the days which began and ended Joseph's absence from Vienna upon his famous tour to the Crimea with the Russian Empress Catharine; if before that absence, then Beethoven was at least three months in the Austrian capital and had left Bonn before the date of Neefe's letter to "Cramer's Magazine"; in which case how could the writer in speaking of his young colleague have omitted all mention of the fact? How, too, could so important a circumstance have been unknown to or forgotten by Dr. Wegeler and have found no place in his "Notizen," which moreover, were prepared under the eyes of both Franz Ries and Madame von Breuning? It will soon be seen that Beethoven was again in Bonn before July 17--a date which admits the bare possibility of the reported meeting with Joseph after his return from Russia.

If an opinion, which, indeed, is little more than a conjecture, may be hazarded in relation with this visit, it is this: that if at any time the missing archives of Maximilian's court should come to light it will be found that not until after the busy week for organists and chapelmusicians ending with Easter was leave of absence granted to Beethoven; and that, too, with no farther pecuniary aid from the Elector than possibly a quarter or two of his salary in advance. In 1787, Easter Monday fell upon the 9th of April, the day after the date of Neefe's letter. Making due allowance of time for the necessary preparations for so important a journey, as in those days it was from Bonn to Vienna, it may be reasonably conjectured that some time in May the youth reached the latter city.

Let another conjecture find place here: it is that Johann van Beethoven had not yet abandoned the hope of deriving pecuniary profit from the precocity of his son's genius; that he still expected the boy, after replacing his hard organ-style of playing by one more suited to the character of the pianoforte, to make his dream of a wonder-child in some degree a reality. Hence--at what fearful cost to the father in his poverty we know not--Ludwig is sent to the most admirable pianist, the best teacher then living, Mozart.

BEETHOVEN'S INTRODUCTION TO MOZART

But enough of conjecture. The oft-repeated anecdote of Beethoven's introduction to Mozart is stripped by Prof. Jahn of Seyfried's superlatives and related in these terms:

Beethoven, who as a youth of great promise came to Vienna in 1786 (?)[35], but was obliged to return to Bonn after a brief sojourn, was taken to Mozart and at that musician's request played something for him which he, taking it for granted that it was a show-piece prepared for the occasion, praised in a rather cool manner. Beethoven observing this, begged Mozart to give him a theme for improvization. He always played admirably when excited and now he was inspired, too, by the presence of the master whom he reverenced greatly; he played in such a style that Mozart, whose attention and interest grew more and more, finally went silently to some friends who were sitting in an adjoining room, and said, vivaciously, "Keep your eyes on him; some day he will give the world something to talk about."

Ries ("Notizen," p. 86) merely says: "During his visit to Vienna he received some instruction from Mozart, but the latter, as Beethoven lamented, never played for him." Contrary to the conjecture above mentioned as to Johann van Beethoven's object in sending his son to Vienna, it seems, from the connection in which Ries introduces this remark, that the instruction given by Mozart to the youth was confined to composition. The lessons given were few--a fact which accounts for the circumstance that no member of Mozart's family in after years, when Beethoven had become world-renowned, has spoken of them.

If it be considered that poor Mozart lost his beloved father on May 28, 1787, and that his mind was then fully occupied with his new operatic subject, "Don Giovanni," it will not be thought strange that he did not exhibit his powers as a pianist to a youth just beginning with him a course of study in composition, especially as the pupil, in his eyes, was a little, undersized boy of 14--as there is every reason to believe. That pupil's power of handling a theme, since Mozart probably knew nothing of his five years' practice at the organ and in the theatre, may well have surprised him; but in execution as a pianist he probably stood far, far below the master when at the same age, below the little Hummel (at that very time an inmate of Mozart's family), and certainly below Cesarius Scheidl (forgotten name!) aged ten, who had played a pianoforte concerto between the parts of an oratorio no longer ago than the preceding 22nd of December in the grand concert of the "Society of Musicians." Had not Beethoven's visit been so abruptly, unexpectedly and sorrowfully brought to an end, he would, doubtless, have had nothing to regret on the score of his master's playing.

In some written talks to Beethoven in the years of his deafness, still preserved, are found two allusions at least made by his nephew to this personal acquaintance with Mozart. In the first case the words are these: "You knew Mozart; where did you see him?" In the other, two or three years later: "Was Mozart a good pianoforte player? It was then still in its infancy." Of course Beethoven's replies are wanting; and herewith is exhausted all that, during the researches for this work, has been found relating to his first visit in Vienna. The Vienna newspapers of the time contained notices of the "wonder-children" Hummel and Scheidl, but none whatever of Beethoven.

ACQUAINTANCES IN AUGSBURG

That the youth in passing through Augsburg must have become acquainted with the pianoforte-maker Stein and his family is self-evident. There is something in a conversation-book which seems to prove this, and also to add evidence to the falsification of his age. It is this: in the spring of 1824 Andreas Streicher and his wife--the same Stein's "Mädl"--whose appearance at the pianoforte when a child of eight and a half years is so piquantly described by Mozart, called upon Beethoven on their way from

Vienna into the country. A few sentences of the conversation, written in the hand of the composer's nephew, are preserved. The topic for a time is the packing of movables and Beethoven's removal into country lodgings for the summer; and at length they come upon the instruments manufactured by Streicher; after which Carl writes: "Frau von Streicher says that she is delighted that at 14 years of age you saw the instruments made by her father and now see those of her son." True, it may be said that this refers to Beethoven's knowledge of the Stein "Hammerclaviere" then in Bonn; but to any one thoroughly conversant with the subject these words are, like Iago's "trifles light as air," confirmation strong of the other view. His introduction to the family of the advocate Dr. Schaden in Augsburg, is certain. Reichardt was in that city in 1790 and wrote of Frau Nanette von Schaden as being of all the women he knew, those of Paris not excepted, far and away the greatest pianoforte player, not excelled perhaps, by any virtuoso in skill and certainty; also a singer with much expression and excellent declamation--"in every respect an amiable and interesting woman." The earliest discovered letter of Beethoven to Schaden, and dated Bonn, September 15, 1787, proves the friendship of the Schadens for him and fully explains the causes of his sudden departure from Vienna and the abrupt termination of his studies with Mozart.

I can easily imagine what you must think of me, and I can not deny that you have good grounds for an unfavorable opinion. I shall not, however, attempt to justify myself, until I have explained to you the reasons why I hope my apologies will be accepted. I must tell you that from the time I left Augsburg my cheerfulness as well as my health began to decline; the nearer I came to my native city the more frequent were the letters from my father urging me to travel with all possible speed, as my mother was not in a favorable state of health. I therefore hurried forward as fast as I could, although myself far from well. My longing once more to see my dying mother overcame every obstacle and assisted me in surmounting the greatest difficulties. I found my mother still alive but in the most deplorable state; her disease was consumption, and about seven weeks ago, after much pain and suffering, she died. She was such a kind, loving mother to me, and my best friend. Ah, who was happier than I when I could still utter the sweet name, mother, and it was heard? And to whom can I now speak it? Only to the silent image resembling her evoked by the power of the imagination. I have passed very few pleasant hours since my arrival here, having during the whole time been suffering from asthma, which may, I fear, eventually develop into consumption; to this is added melancholy--almost as great an evil as my malady itself. Imagine yourself in my place, and then I shall hope to receive your forgiveness for my long silence. You showed me extreme kindness and friendship by lending me three Carolins in Augsburg, but I must entreat your indulgence for a time. My journey cost me a great deal, and I have not the smallest hopes of earning anything here. Fate is not propitious to me in Bonn.

Pardon my detaining you so long with my chatter; it was necessary for my justification.

I do entreat you not to deprive me of your valuable friendship; nothing do I wish so much as in some degree to become worthy of your regard.

I am, with the highest respect Your most obedient servant and friend, L. v. Beethoven, Court Organist to the Elector of Cologne.[36]

DEATH OF BEETHOVEN'S MOTHER

The Bonn "Intelligenzblatt" supplies a pendant to this sad letter:--"1787, July 17. Died, Maria Magdalena Koverich (_sic_), named van Beethoven, aged 49 years."[37] When Ferdinand Ries, some thirteen years later, presented his father's letter of introduction to Beethoven in Vienna, the latter "read the letter through" and said: "I cannot answer your father just now; but do you write to him that I have not forgotten how my mother died. He will be satisfied with that." "Later," adds Ries, "I learned that, the family being greatly in need, my father had been helpful to him on this occasion in every way."

A petition of Johann van Beethoven, offered before the death of his wife, describing his pitiable condition and asking aid from the Elector, has not been discovered; but the substance of it is found in a volume of "Geheime Staats-Protocolle" for 1787 in form following:

July 24, 1787

Your Elec. Highness has taken possession of this petition.

Court Musician makes obedient representation that he has got into a very unfortunate state because of the long-continued sickness of his wife and has already been compelled to sell a portion of his effects and pawn others and that he no longer knows what to do for his sick wife and many children. He prays for the benefaction of an advance of 100 rthlr. on his salary.

No record is found in the Düsseldorf archives of any grant of aid to the distressed family; hence, so far as now appears, the only successful appeal for assistance was made to Franz Ries, then a young man of 32 years, who generously aided in “every way” his unfortunate colleague. Where then was the Breuning family? Where Graf Waldstein? To these questions the reply is that Beethoven was still unknown to them--a reply which involves the utter rejection of the chronology adopted by Dr. Wegeler, in his “Notizen,” of that part of the composer’s life. This mistake, if indeed it prove to be such, is one which has been adopted without hesitation by all who have written upon the subject. The reader here, for the first time, finds Wegeler’s account of Beethoven’s higher intellectual development and his introduction into a more refined social circle placed after, instead of before, the visit to Vienna; and his introduction to the Breunings and Waldstein dated at the time when the youth was developing into the man, and not at a point upon the confines of childhood and youth.

This demands some explanation.

DR. WEGELER’S CHRONOLOGY CORRECTED

The history of Beethoven’s Bonn life would be so sadly imperfect without the “Notizen” of Dr. Wegeler, which bear in every line such an impress of perfect candor and honesty, that they can be read only with feelings of gratefullest remembrance of their author and with fullest confidence in their authenticity. But no more in his case than in others can the reminiscences of an aged man be taken as conclusive evidence in regard to facts and occurrences of years long since past, when opposed to contemporary records, or involving confusion of dates. Some slight lapse of memory, misapprehension, or unlucky adoption of another’s mistake, may lead astray and be the abundant source of error. Still, it is only with great diffidence and extreme caution that one can undertake to correct an original authority so trustworthy as Dr. Wegeler. Such corrections must be made, however; for only by this can many a difficulty be removed. An error in the Doctor’s chronology might easily be occasioned by the long accepted false date of Beethoven’s birth, insensibly influencing his recollections; and certainly when Dr. Wegeler, Madame von Breuning and Franz Ries, all alike venerable in years as in character, sit together discussing in 1837-8 occurrences of 1785-8, with nothing to aid their memories or control their reminiscences but an old Court Calendar or two, they may well to some extent have confounded times and seasons in the vague and misty distance of so many years; the more easily because the error is one of but two or three years at most. Bearing upon the point in question is the fact that Frau Karth--who distinctly remembers the death of Madame van Beethoven--has no recollections of the young Breunings and Waldstein until after that event.

Some words of Dr. Wegeler in an unprinted letter to Beethoven (1825): “inasmuch as the house of my mother-in-law was more your domicile than your own, especially after you lost your noble mother,” seem to favor the usually accepted chronology: but if Beethoven was thus almost a member of the Breuning family as early as 1785 or 1786, how can the tone of the letter to Dr. Schaden be explained? Or how account for the fact, that, when he reached Bonn again and found his mother dying, and his father “in a very unfortunate state” and “compelled to sell a portion of his effects and pawn others and knew not what to do,” it was to Franz Ries he turned for aid? The good Doctor is certainly mistaken as to the time when Beethoven found Mæcenases in the Elector and Waldstein; why not equally so in relation to the Breuning family?

If, now, his own account of his intimacy with the young musician--given in the preface to the “Notizen”--be examined, it will be found to strengthen what has just been said: “Born in Bonn in 1765, I became acquainted in 1782 with the twelve years old lad, who, however, was already known as an author, and lived in most intimate association with him uninterruptedly until September, 1787” (and still he could forget that friend’s absence in Vienna only a few months before), “when, to finish my medical studies, I visited the Vienna schools and institutions. After my return in October, 1789, we continued to live together in an equally cordial association until Beethoven’s later departure for Vienna towards the close of 1792, whither I also emigrated in October, 1794.”

For more than two years, then, and just at this period, Dr. Wegeler was not in Bonn. Let still another circumstance be noted: Nothing has been discovered, either in the “Notizen” or elsewhere, which necessarily implies that Wegeler himself intimately knew the Breunings until after his return from Vienna in 1789; moreover, in those days, when the distinctions of rank were so strongly marked, it is, to say the least, exceedingly improbable, that the son of an immigrant Alsatian shoemaker should have obtained entrée upon the supposed terms of intimacy in a household in which the oldest child was some six years younger than himself, and which belonged to the highest social, if not titled rank, until he by the force of his talents, culture, and high character, had risen to its level. That, after so rising, the obscurity of his birth was forgotten and the only daughter became his wife, is alike honorable to both parties. It is unnecessary to pursue the point farther; the reader, having his attention drawn to it, will observe for himself the many less prominent, but strongly corroborating circumstances of the narrative, which confirm the chronology adopted in it. At all events it must stand until new and decisive facts against it be found.[38]

A YEAR OF SADNESS AND GLOOM

“My journey cost me a great deal, and I have not the smallest hope of earning anything here. Fate is not propitious to me in Bonn.” In poverty, ill, melancholy, despondent, motherless, ashamed of and depressed by his father’s ever increasing moral infirmity, the boy, prematurely old from the circumstances in which he had been placed since his eleventh year, had yet to bear another “sling and arrow of outrageous fortune.” The little sister, now a year and a half old--but here is the notice from the “Intelligenzblatt”:--“Died, November 25, Margareth, daughter of the Court Musician Johann van Beethoven, aged one year.” And so faded the last hope that the passionate tenderness of Beethoven’s nature might find scope in the purest of all relations between the sexes--that of brother and sister.

Thus, in sadness and gloom, Beethoven’s seventeenth year ended.

FOOTNOTES:

[32] Czerny also related that Beethoven had spoken to him of the harsh treatment and insufficient instruction received from his father. “But,” he added, “I had talent for music.” From a note by Otto Jahn. Also see Cock’s “Musical Miscellany.”

[33] “Urian’s Reise um die Welt.” Op. 52, No. 1, published in 1805.

[34] The manuscript formerly owned by Artaria is now (1907) in the possession of Dr. E. Prieger in Bonn. The figure indicating the composer’s age was first written “14” and then changed.

[35] In the first edition of Jahn’s “Mozart” the date is given as here. In later editions it was corrected in accordance with Thayer’s suggestion to 1787.

[36] Lady Wallace’s translation, amended. The letter is preserved in the Beethoven-Haus Museum in Bonn.

[37] The age of Beethoven’s mother at the time of her death is here incorrectly given. It should be 40.

[38] Thayer’s correction of Dr. Wegeler’s account of Beethoven’s first acquaintance with the family von Breuning was sharply criticized by a grandson of Wegeler in an article published in the _Coblenzer Zeitung_ of May 20, 1890. Thayer preserved Karl Wegeler’s article in the library copy of his biography, and had he lived to revise his work he would undoubtedly either have corrected his assertions or confirmed them. According to Dr. Wegeler (this is the younger Wegeler’s argument, in brief), Beethoven had been introduced to the von Breuning family at least as early as 1785, and in that circle had already met Count Waldstein, who had aided him in securing his first salary as Court Organist. The “Notizen” do not fix the dates, though they imply that the occurrences took place before 1785. As to the statement of the Widow Karth, Wegeler urges that the testimony of a child five years old could have no weight as against that of persons of mature age, and that an acquaintance might well exist without intercourse in the Beethoven dwelling. The letter to Dr. Schaden, the product of a melancholy mood, does not preclude the possibility that Beethoven had received help from another source, especially since great care had to be exercised in extending succor to him lest his sensibilities be hurt. Certain it is that Wegeler, who did not go to Vienna till 1787, had been a faithful friend and helper in the period of Beethoven’s destitution, as was proved by a thitherto unpublished letter of Beethoven to Wegeler, in which the former expressly stated that the latter had known him, Beethoven, almost since childhood. If the von Breuning family were really not on hand at the time of Beethoven’s trouble, the fact might be explained by their annual sojourn in the country, which was generally of considerable duration. Thayer’s assumption that Wegeler himself did not get intimately acquainted with the von Breunings until after his return from Vienna (in 1789) is at variance with the family recollections, which presented him as a young student (therefore before 1787) and with him Beethoven at the time when they became visitors at the house. Weakness of memory on the part of a man so intellectually fresh and vigorous as Dr. Wegeler was in 1838 (he died ten years later) was not to be assumed; least of all can Dr. Wegeler have erred concerning the beginning of his acquaintance with the family from which he got his wife. Finally, the intimate terms of friendship which existed between Beethoven and Eleonore von Breuning could be fully explained only on the theory of a childhood acquaintance.

In the first edition of Thayer’s biography (1866) Dr. Deiters printed the text bearing on this question as it is given above without note or comment. In the revised edition of Volume I (1901), he reproduced the original text in the body of the page but appended a footnote in which, while asserting that an authority like Thayer ought not to be opposed except “with great diffidence and extreme caution” (to use Thayer’s words referring to Dr. Wegeler), he nevertheless upheld the contention of Dr. Wegeler’s grandson. He says: “The definite assertion of Wegeler that he made the acquaintance of Beethoven as early as 1782, which is supported by

Beethoven's own words, 'you knew me almost since my childhood,' is not to be shaken. As little can it be questioned that Wegeler had been introduced in the Breuning house as a student before his departure for Vienna (according to Gerhard von Breuning before his acquaintance with Beethoven began); here Dr. Wegeler could not have made an error. Concerning his bringing Beethoven to the house he gives no date; the year 1785 is not mentioned in the "Notizen." On page 45, however, it is stated that Stephan von Breuning "lived in closest affiliation with him (Beethoven) from his tenth year till his death." Stephan was born August 17, 1774 (_Vide_ "Aus dem Schwarzspanierhause," page 6); this would indicate the year 1784. Wegeler's remark, "especially after you lost your noble mother," makes it clear as day that a close friendship existed before the death of Beethoven's mother."

Chapter VII

The von Breuning Family--Beethoven Brought Under Refining Influences--Count Waldstein, His Mæcenas--The Young Musician is Forced to Become Head of the Family.

In 1527, the year in which the administration of the office of _Hochmeister_ of the Teutonic Order was united with that of the _Deutschmeister_, whose residence had already been fixed at Mergentheim in 1525, this city became the principal seat of the order. From 1732 to 1761 Clemens Augustus was _Hoch- und Deutschmeister_ of the order; according to the French edition of the Court Calendar of 1761, Christoph von Breuning was _Conseiller d'État et Référendaire_, having succeeded his father-in-law von Mayerhofen in the office.

BEETHOVEN'S FRIENDS: THE VON BREUNINGS

Christoph von Breuning had five sons: Georg Joseph, Johann Lorenz, Johann Philipp, Emanuel Joseph and Christoph. Lorenz became chancellor of the Archdeanery of Bonn, and the _Freiadliges Stift_ at Neuss; after the death of his brother Emanuel he lived in Bonn so that, as head of the family, he might care for the education of the latter's children. He died there in 1796. Johann Philipp, born 1742 at Mergentheim, became canon and priest at Kerpen, a place on the old highway from Cologne to Aix-la-Chapelle, where he died June 12, 1831. Christoph was court councillor at Dillingen.

Emanuel Joseph continued in the electoral service at Bonn; at the early age of 20 years he was already court councillor (_Conseiller actuel_). He married Hélène von Kerich, born January 3, 1750, daughter of Stephan von Kerich, physician to the elector. Her brother, Abraham von Kerich, canon and scholaster of the archdeanery of Bonn, died in Coblenz in 1821. A high opinion of the intellect and character of Madame von Breuning is enforced upon us by what we learn of her influence upon the youthful Beethoven. Court Councillor von Breuning perished in a fire in the electoral palace on January 15, 1777. The young widow (she had barely attained her 28th year), continued to live in the house of her brother, Abraham von Kerich, with her three children, to whom was added a fourth in the summer of 1777. Immediately after the death of the father, his brother, the canon Lorenz von Breuning, changed his residence from Neuss to Bonn and remained in the same house as guardian and tutor of the orphaned children. These were:

1. Christoph, born May 13, 1771, a student of jurisprudence at Bonn, Göttingen and Jena, municipal councillor in Bonn, notary, president of the city council, professor at the law school in Coblenz, member of the Court of Review in Cologne, and, finally, _Geheimer Ober-Revisionsrath_ in Berlin. He died in 1841.

2. Eleonore Brigitte, born April 23, 1772. On March 28, 1802, she was married to Franz Gerhard Wegeler of Beul-an-der-Ahr, and died on June 13, 1841, at Coblenz.

3. Stephan, born August 17, 1774. He studied law at Bonn and Göttingen, and shortly before the end of the electorship of Max Franz was appointed to an office in the Teutonic Order at Mergentheim. In the spring of 1801 he went to Vienna, where he renewed his acquaintance with Beethoven. They had simultaneously been pupils of Ries in violin playing. The Teutonic Order offering no chance of advancement to a young man, he was given employment with the War Council and became Court Councillor in 1818. He died on June 4, 1827. His first wife was Julie von Vering, daughter of Ritter von Vering, a military physician; she died in the eleventh month of her wedded life. He then married Constanze Ruschowitz, who became the mother of Dr. Gerhard von Breuning, born August 28, 1813, author of "Aus dem Schwarzspanierhause."

4. Lorenz (called Lenz, the posthumous child), born in the summer of 1777, studied medicine and was in Vienna in 1794-97 simultaneously with Wegeler and Beethoven. He died on April 10, 1798 in Bonn.[39]

Madame von Breuning, who died on December 9, 1838, after a widowhood of 61 years, lived in Bonn until 1815, then in Kerpen, Beul-an-der-Ahr, Cologne and finally with her son-in-law, Wegeler, in Coblenz.

The acquaintance between Beethoven and Stephan von Breuning may have had some influence in the selection of the young musician as pianoforte teacher for Eleonore and Lorenz,[40] an event (in consideration of circumstances already detailed and of the ages, real and reputed, of pupils and master) which may be dated at the close of the year 1787, and which was, perhaps, the greatest good that fate, now become propitious, could have conferred upon him; for he was now so situated in his domestic relations, and at such an age, that introduction into so highly refined and cultivated a circle was of the highest value to him both morally and intellectually. The recent loss of his mother had left a void in his heart which so excellent a woman as Madame von Breuning could alone in some measure fill. He was at an age when the evil example of his father needed a counterbalance; when the extraordinary honors so recently paid to science and letters at the inauguration of the university would make the strongest impression; when the sense of his deficiencies in everything but his art would begin to be oppressive; when his mental powers, so strong and healthy, would demand some change, some recreation, from that constant strain in the one direction of music to which almost from infancy they had been subjected; when not only the reaction upon his mind of the fresh and new intellectual life now pervading Bonn society, but his daily contact with so many of his own age, friends and companions now enjoying advantages for improvement denied to him, must have cost him many a pang; when a lofty and noble ambition might be aroused to lead him ever onward and upward; when, the victim of a despondent melancholy, he might sink into the mere routine musician, with no lofty aims, no higher object than to draw from his talents means to supply his necessities and gratify his appetites.

There must have been something very engaging in the character of the small, pockmarked youth, or he could not have so won his way into the affections of the Widow von Breuning and her children. In his “Notizen” Wegeler writes:

In this house reigned an unconstrained tone of culture in spite of youthful wilfulness. Christoph von Breuning made early essays in poetry, as was the case (and not without success) with Stephan von Breuning much later. The friends of the family were distinguished by indulgence in social entertainments which combined the useful and the agreeable. When we add that the family possessed considerable wealth, especially before the war, it will be easy to understand that the first joyous emotions of Beethoven found vent here. Soon he was treated as one of the children of the family, spending in the house not only the greater part of his days, but also many nights. Here he felt that he was free, here he moved about without constraint, everything conspired to make him cheerful and develop his mind. Being five years older than Beethoven I was able to observe and form a judgment on these things.

It must not be forgotten that besides Madame von Breuning and her children the scholastic Abraham von Kerich and the canon Lorenz von Breuning were members of the household. The latter especially seems to have been a fine specimen of the enlightened clergy of Bonn who, according to Risbeck, formed so striking a contrast to the priests and monks of Cologne; and it is easy to trace Beethoven’s life-long love for the ancient classics--Homer and Plutarch at the head--to the time when the young Breunings would be occupied with them in the original under the guidance of their accomplished tutor and guardian. The uncle, Philipp von Breuning, may also have been influential in the intellectual progress of the young musician, for to him at Kerpen “the family von Breuning and their friends went annually for a vacation of five or six weeks. There, too, Beethoven several times spent a few weeks right merrily, and was frequently urged to play the organ,” as Wegeler tells us in the “Notizen.” There let him be left enjoying and profiting by his intimacy with that family, and returning their kindness in some measure by instructing Eleonore and Lenz in music, while a new friend and benefactor is introduced.

COUNT WALDSTEIN’S ARRIVAL IN BONN

Emanuel Philipp, Count Waldstein and Wartemberg von Dux, and his wife, a daughter of Emanuel Prince Lichtenstein, were parents of eleven children. The fourth son was Ferdinand Ernst Gabriel, born March 24, 1762. Uniting in his veins the blood of many of the houses of the Austrian Empire, there was no career, no line of preferment open to younger sons of titled families, which was not open to him, or to which he might not aspire. It was determined that he should seek activity in the Teutonic Order, of which Max Franz was Grand Master. According to the rules and regulations of the order, the young nobleman came to Bonn to pass his examinations and spend his year of novitiate. Could the time of his arrival there be determined with certainty, the date would have a most important bearing either to confirm or disprove the chronological argument of some of our earlier pages; but one may well despair of finding so unimportant an event as the journey of a young man of 25 from Vienna to the Rhine anywhere upon record. One thing bearing directly upon this point may be read in the “Wiener Zeitung” of July 2, 1788. A correspondent in Bonn says that on “the day before yesterday,” i.e., June 17, 1788, “our gracious sovereign, as Hoch- und Deutschmeister, gave the accolade with

the customary ceremonies to the Count von Waldstein, who had been accepted in the Teutonic Order." Allowing for the regular year of novitiate, the Count was certainly in Bonn before the 17th of June, 1787.

The misfortune of two unlucky Bohemian peasants, strange as it may seem, gives us, after the lapse of a century, a satisfactory solution of the difficulty. Some one reports in the "Wiener Zeitung" of May, 19, 1787, that on the 4th of that month two peasant houses were destroyed by fire in the village of Likwitz belonging to Osegg, and adds: "Count Ferdinand von Waldstein, moved by a noble spirit of humanity, hurried from Dux, took charge of affairs and was to be found wherever the danger was greatest." It was between May 4 and June 17, 1787, that Waldstein parted from his widowed mother and journeyed to the place of his novitiate. His name may easily have become known to Wegeler before the latter's departure from Bonn for Vienna.[41] Here follows what the good doctor says of the Count--to what degree correct or mistaken, the reader can determine for himself:

The first, and in every respect the most important, of the Mæcenases of Beethoven was Count Waldstein, Knight of the Teutonic Order, and (what is of greater moment here) the favorite and constant companion of the young Elector, afterwards Commander of the Order at Virnsberg and Chancellor of the Emperor of Austria. He was not only a connoisseur but also a practitioner of music. He it was who gave all manner of support to our Beethoven, whose gifts he was the first to recognize worthily. Through him the young genius developed the talent to improvise variations on a given theme. From him he received much pecuniary assistance bestowed in such a way as to spare his sensibilities, it being generally looked upon as a small gratuity from the Elector.

Beethoven's appointment as organist, his being sent to Vienna by the Elector, were the doings of the Count. When Beethoven at a later date dedicated the great and important Sonata in C major, Op. 53, to him, it was only a proof of the gratitude which lived on in the mature man. It is to Count Waldstein that Beethoven owed the circumstance that the first sproutings of his genius were not nipped; therefore we owe this Mæcenas Beethoven's later fame.

Frau Karth remembered distinctly the 17th of June upon which Waldstein entered the order, the fact being impressed upon her mind by a not very gentle reminder from the stock of a sentinel's musket that the palace chapel was no place for children on such an occasion. She remembered Waldstein's visits to Beethoven in the years following in his room in the Wenzelgasse and was confident that he made the young musician a present of a pianoforte.

To save his line from extinction the Count obtained a dispensation from his vows and married (May 9, 1812) Maria Isabella, daughter of Count Rzewski. A daughter, Ludmilla, was born to him; but no son. He died on August 29, 1823, and the family of Waldsteins of Dux disappears. While all that Wegeler says of this man's kindness in obtaining the place of organist for Beethoven and of his influence upon his musical education is one grand mistake,[42] there is no reason whatever to doubt that those qualities which made the youth a favorite with the Breunings, added to his manifest genius, made their way to the young count's heart and gained for Beethoven a zealous, influential and active friend. Still, in June, 1778, Waldstein possessed no such influence as to render a petition for increase of salary, offered by his protégé, successful. That document has disappeared, but a paper remains, dated June 5, concerning the petition, which is endorsed "Beruhet." Whatever this word may here mean it is certain that Ludwig's salary as organist remained at the old point of 100 thalers, which, with the 200 received by his father, the three measures of grain and the small sum that he might earn by teaching, was all that Johann van Beethoven and three sons, now respectively in their eighteenth, fifteenth and twelfth years, had to live upon; and therefore so much the more necessity for the exercise of Waldstein's generosity.

LUDWIG THE HEAD OF THE FAMILY

After the death of the mother, says Frau Karth, a housekeeper was employed and the father and sons remained together in the lodgings in the Wenzelgasse. Carl was intended for the musical profession; Johann was put apprentice to the court apothecary, Johann Peter Hittorf. Two years, however, had hardly elapsed when the father's infirmity compelled the eldest son, not yet nineteen years of age, to take the extraordinary step of placing himself at the head of the family. One of Stephan von Breuning's reminiscences shows how low Johann van Beethoven had sunk: viz., that of having seen Ludwig furiously interposing to rescue his intoxicated father from an officer of police.

Here again the petition has disappeared, but its contents are sufficiently made known by the terms of the decree dated November 20, 1789:

His Electoral Highness having graciously granted the prayer of the petitioner and dispensed henceforth wholly with the services of his father, who is to withdraw to a village in the electorate, it is graciously commanded that he be paid in accordance with his wish

only 100 rthr. of the annual salary which he has had heretofore, beginning with the approaching new year, and that the other 100 thlr. be paid to the suppliant's son besides the salary which he now draws and the three measures of grain for the support of his brothers.

It is probable that there was no intention to enforce this decree in respect of the withdrawal of the father from Bonn, and that this clause was inserted _in terrorem_ in case he misbehaved himself; for he continued, according to Frau Karth, to dwell with his children, and his first receipt, still preserved, for the reduced salary is dated at Bonn--a circumstance, however, which alone would prove little or nothing.

FOOTNOTES:

[39] Dr. Deiters, differing with Thayer on the subject of the date of the beginning of the intimacy between Beethoven and the von Breuning family, omitted in the revised version of the Beethoven biography the author's comments on the brief biographical data concerning the sons, which were as follows: "These dates, communicated by Dr. Gerhard, son of Stephan von Breuning, prove a singular inaccuracy in Wegeler's remark ('Nachtrag zur Notizen,' page 26): 'Lenz, as the youngest of the three brothers, was nearest to Beethoven in age.'" Of Stephan he says: "Inasmuch as he had lived in intimate association with Beethoven from his tenth year up to his death." Many a proof of this general fact will hereafter appear; but whether this "intimate association" began quite so early is a question. The two were at the same time pupils of Franz Ries on the violin, and they may well have become acquainted in 1785 or 1786; but it was not favorable to extreme intimacy that four years' difference existed in their ages; and that the one was but a schoolboy while the other was already an organist, an author and accustomed to move among men.

[40] Gerhard von Breuning would have it appear from a statement on page 6 of his book "Aus dem Schwarzspanierhause," that Beethoven was recommended to the von Breunings by Wegeler.

[41] Dr. Wegeler's grandson, in his criticism of Thayer's assertions concerning the date of the beginning of the acquaintance between Beethoven and the von Breunings, falls foul of even this ingenious demonstration, saying that the incident of the conflagration might have taken place when Count Waldstein was at home visiting his mother. He could not believe that the Count had spent all of the first 24 years of his life at Dux in "idyllic solitude," and argued that he might have visited Bonn _for the first time_ at an earlier date than 1787. Dr. Deiters held that the point was well taken; as if there was no alternative for the young count between "idyllic solitude" at Dux and a sojourn at Bonn!

[42] Thus in Mr. Thayer's original manuscript. Dr. Deiters omitted the remark in his revision, but it is here permitted to stand along with other controverted matters.

Chapter VIII

The National Theatre of Max Franz--Beethoven's Artistic Associates--Practical Experience in the Orchestra--The "Ritterballet"--The Operatic Repertory of Five Years.

OPERA UNDER ELECTOR MAX FRANZ

Early in the year 1788, the mind of the Elector, Max Franz, was occupied with the project for forming a company of _Hofschauspieler;_ in short, with the founding of a National Theatre upon the plan adopted by his predecessor in Bonn and by his brother Joseph in Vienna. His finances were now in order, the administration of public affairs in able hands and working smoothly, and there was nothing to hinder him from placing both music and theatre upon a better and permanent footing; which he now proceeded to do. The Klos troupe, which had left Cologne in March, played for a space in Bonn, and on its dispersal in the summer several of its better actors were engaged and added to others who had already settled in Bonn. The only names which it is necessary to mention here are those of significance in the history of Beethoven. Joseph Reicha was director; Neefe, pianist and stage-manager for opera; in the orchestra were Franz Ries and Andreas Romberg (violin), Ludwig van Beethoven (viola), Bernard Romberg (violoncello), Nicolaus Simrock (horn) and Anton Reicha (flute). A comparison of the lists of the theatrical establishment with that of the court chapel as printed in the Court Calendars for 1778 and the following years, shows that the two institutions were kept distinct, though the names for the greater part appear in both. Some of the singers in the chapel played in the theatrical orchestra, while certain of the players in the chapel sang upon the stage. Other names appear in but one of the lists.

As organist the name of Beethoven appears still in the Court Calendar, but as viola player he had a place in both the orchestras. Thus, for a period of full four years, he had the opportunity of studying practically orchestral compositions in the best of all

schools--the orchestra itself. This body of thirty-one members, under the energetic leadership of Reicha, many of them young and ambitious, some already known as virtuosos and still keeping their places in musical history as such, was a school for instrumental music such as Handel, Bach, Mozart and Haydn had not enjoyed in their youth; that its advantages were improved both by Beethoven and others of the younger men, all the world knows.

One fact worthy of note in relation to this company is the youth of most of the new members engaged. Maximilian seems to have sought out young talent, and when it proved to be of true metal, gave it a permanent place in his service, adopted wise measures for its cultivation, and thus laid a foundation upon which, but for the outbreak of the French Revolution, and the consequent dispersion of his court, would in time have risen a musical establishment, one of the very first in Germany.

This is equally true of the new members of his orchestra. Reicha himself was still rather a young man, born in 1757. He was a virtuoso on the violoncello and a composer of some note; but his usefulness was sadly impaired by his sufferings from gout. The cousins Andreas and Bernhard Romberg, Maximilian had found at Münster and brought to Bonn. They had in their boyhood, as virtuosos upon their instruments--Andreas violin, Bernhard 'cello--made a tour as far as Paris, and their concerts were crowned with success. Andreas was born near Münster in 1767, and Ledebur ("Tonkünstler Berlins") adopts the same year as the date also of Bernhard's birth. They were, therefore, three years older than Beethoven and now just past 21. Both were already industrious and well-known composers and must have been a valuable addition to the circle of young men in which Beethoven moved. The decree appointing them respectively Court Violinist and Court Violoncellist is dated November 19, 1790.

Anton Reicha, a fatherless nephew of the concertmaster, born at Prague, February 27, 1770, was brought by his uncle to Bonn. He had been already for some years in that uncle's care and under his instruction had become a good player of the flute, violin and pianoforte. In Bonn, Reicha became acquainted with Beethoven, who was then organist at court. "We spent fourteen years together," says Reicha, "united in a bond like that of Orestes and Pylades, and were continually side by side in our youth. After a separation of eight years we saw each other again in Vienna, and exchanged confidences concerning our experiences." At the age of 17 composing orchestral and vocal music for the Electoral Chapel, a year later flautist in the theatre, at nineteen both flautist and violinist in the chapel and so intimate a friend of Beethoven, who was less than a year his junior--were Reicha's laurels no spur to the ambition of the other?

The names of several of the performers upon wind-instruments were new names in Bonn, and the thought suggests itself that the Elector brought with him from Vienna some members of the _Harmoniemusik_ which had won high praise from Reichardt, and it will hereafter appear that such a band formed part of the musical establishment in Bonn--a fact of importance in its bearing upon the questions of the origin and date of various known works both of Beethoven and of Reicha, and of no less weight in deciding where and how these men obtained their marvellous knowledge of the powers and effects of this class of instruments.

The arrangements were all made in 1788, but not early enough to admit of the opening of the theatre until after the Christmas holidays, namely, on the evening of January 3, 1789. The theatre had been altered and improved. An incendiary fire threatened its destruction the day before, but did not postpone the opening. The opening piece was "Der Baum der Diana" by Vincenzo Martin. It may be thought not very complimentary to the taste of Maximilian that the first season of his National Theatre was opened thus, instead of with one of Gluck's or Mozart's masterpieces. It suffices to say that he, in his capacity of Grand Master of the Teutonic Order, had spent a good part of the autumn at Mergentheim and only reached Bonn on his return on the last day of January. Hence he was not responsible for that selection.

The season which opened on January 3, 1789, closed on May 23. Within this period the following operas were performed, Beethoven taking part in the performances as a member of the orchestra: "Der Baum der Diana" (_L'Arbore di Diana_), Martin; "Romeo und Julie," Georg Benda; "Ariadne" (duo-drama by Georg Benda); "Das Mädchen von Frascati" (_La Frascatana_), Paisiello; "Julie," Desaides; "Die drei Pächter" (_Les trois Fermiers_), Desaides; "Die Entführung aus dem Serail," Mozart; "Nina," Dalayrac; "Trofonio's Zauberhöhle" (_La grotta di Trofonio_), Salieri; "Der eifersüchtige Liebhaber" (_L'Amant jaloux_), Grétry; "Der Schmaus" (_Il Convivo_), Cimarosa; "Der Alchymist," Schuster; "Das Blendwerk" (_La fausse Magie_), Grétry.

The second season began October 13, 1789, and continued until February 23, 1790. On the 24th of February news reached Bonn of the death of Maximilian's brother, the Emperor Joseph II, and the theatre was closed. The repertory for the season comprised "Don Giovanni," Mozart (which was given three times); "Die Colonie" (_L'Isola d'Amore_), Sacchini; "Der Barbier von Sevilla" (_Il Barbiere di Siviglia_), Paisiello; "Romeo und Julie," Georg Benda; "Die Hochzeit des Figaro" (_Le Nozze di Figaro_), Mozart (given four times); "Nina," Dalayrac; "Die schöne Schusterin," Umlauf; "Ariadne," Georg Benda; "Die Pilgrimme von Mecca," Gluck; "Der

König von Venedig" (_Il Re Teodoro_), Paisiello; "Der Alchymist," Schuster; "Das listige Bauernmädchen" (_La finta Giardiniera_), Paisiello; "Der Doktor und Apotheker," Dittersdorf. A letter to the "Berliner Annalen des Theaters" mentions three operas which are not in the list of the theatrical calendar and indicates that the theatre was opened soon after receipt of the intelligence of the death of Joseph, and several pieces performed, among them _Il Marchese Tulipano_ by Paisiello. The writer also mentions performances of Anfossi's (or Sarti's) _Avaro inamorato_, Pergolese's _Serva padrona_ and _La Villanella di spirito_, composer unmentioned, by an Italian company headed by Madame Bianchi.

The third season began October 23, 1790, and closed on March 8, 1791. Between the opening and November 27, performances of the following musical-dramatic works are recorded: "König Theodor in Venedig" (_Il Re Teodoro_), Paisiello; "Die Wilden" (_Azemia_), Dalayrac; "Der Alchymist," Schuster; "Kein Dienst bleibt unbelohnt," (?); "Der Barbier von Sevilla," Paisiello; "Die schöne Schusterin," Umlauf; "Lilla," Martini; "Die Geitzigen in der Falle," Schuster; "Nina," Dalayrac; "Dr. Murner," Schuster. On March 8, the season closed with a ballet by Horschelt, "Pyramus und Thisbe." The reporter in the "Theaterkalender" says:

On Quinquagesima Sunday (March 6) the local nobility performed in the Ridotto Room a characteristic ballet in old German costume. The author, His Excellency Count Waldstein, to whom the composition and music do honor, had shown in it consideration for the chief proclivities of our ancestors for war, the chase, love and drinking. On March 8, all the nobility attended the theatre in their old German dress and the parade made a great, splendid and respectable picture. It was also noticeable that the ladies would lose none of their charms, were they to return to the costumes of antiquity.

Before proceeding with this history a correction must be made in this report: the music to the "Ritterballet," which was the characteristic ballet referred to, was not composed by Count Waldstein but by Ludwig van Beethoven. We shall recur to it presently. Owing to a long-continued absence of the Elector, the principal singers and the greater part of the orchestra, the fourth season did not begin till the 28th of December, 1791. Between that date and February 20, 1792, the following musical works were performed: "Doktor und Apotheker," Dittersdorf; "Robert und Caliste," Guglielmi; "Félix," Monsigny; "Die Dorfdeputirten," Schubauer; "Im Trüben ist gut Fischen" (_Fra due Litiganti, il Terzo gode_), Sarti; "Das rothe Käppchen," Dittersdorf; "Lilla," Martini; "Der Barbier von Sevilla," Paisiello; "Ende gut, Alles gut," music by the Electoral Captain d'Antoin; "Die Entführung aus dem Serail," Mozart; "Die beiden Savoyarden" (_Les deux petits Savoyards_), Dalayrac.

OPERAS AT BONN IN 1792

The fifth season began in October, 1792. Of the nine operas given before the departure of Maximilian and the company to Münster in December, "Die Müllerin" by De la Borde, "König Axur in Ormus" by Salieri, and "Hieronymus Knicker" by Dittersdorf, were the only ones new to Bonn; and in only the first two of these could Beethoven have taken part, unless at rehearsals; for at the beginning of November he left Bonn--and, as it proved, forever. Probably Salieri's masterpiece was his last opera within the familiar walls of the Court Theatre of the Elector of Cologne.

Beethoven's eighteenth birthday came around during the rehearsals for the first season, of this theatre; his twenty-second just after the beginning of the fifth. During four years (1788-1792) he was adding to his musical knowledge and experience in a direction wherein he has usually been represented as deficient--as active member of an operatic orchestra; and the catalogue of works performed shows that the best schools of the day, save that of Berlin, must have been thoroughly mastered by him in all their strength and weakness. Beethoven's titanic power and grandeur would have marked his compositions under any circumstances; but it is very doubtful if, without the training of those years in the Electoral "Toxal, Kammer und Theater" as member of the orchestra, his works would have so abounded in melodies of such profound depths of expression, of such heavenly serenity and repose and of such divine beauty as they do, and which give him rank with the two greatest of melodists, Handel and Mozart.

Chapter IX

Gleanings of Musical Fact and Anecdote--Haydn in Bonn--A Rhine Journey--Abbé Sterkel--Beethoven Extemporises--Social and Artistic Life in Bonn--Eleonore von Breuning--The Circle of Friends--Beethoven Leaves Bonn Forever--The Journey to Vienna.

As a pendant to the preceding sketches of Bonn's musical history a variety of notices belonging to the last three years of Beethoven's life in his native place are here brought together in chronological order. Most of them relate to him personally, and some of them, through errors of date, have been looked upon hitherto as adding proofs of the precocity of his genius.

Prof. Dr. Wurzer communicated to the "Kölnische Zeitung" of August 30, 1838, the following pleasant anecdote:

In the summer of the year 1790 or 1791 I was one day on business in Godesberger Brunnen. After dinner Beethoven and another young man came up. I related to him that the church at Marienforst (a cloister in the woods behind Godesberg) had been repaired and renovated, and that this was also true of the organ, which was either wholly new or at least greatly improved. The company begged him to give them the pleasure of letting them hear him play on the instrument. His great good nature led him to grant our wish. The church was locked, but the prior was very obliging and had it unlocked for us. B. now began to play variations on themes given him by the party in a manner that moved us profoundly; but what was much more significant, poor laboring folk who were cleaning out the débris left by the work of repair, were so greatly affected by the music that they put down their implements and listened with obvious pleasure. _Sit ei terra levis!_

JOSEPH HAYDN'S VISIT TO BONN

The greatest musical event of the year (1790) in Bonn occurred just at its close--the visit of Joseph Haydn, on his way to London with Johann Peter Salomon, whose name so often occurs in the preliminary chapters of this work. Of this visit, Dies has recorded Haydn's own account:

In the capital, Bonn, he was surprised in more ways than one. He reached the city on Saturday [Christmas, December 25] and set apart the next day for rest. On Sunday, Salomon accompanied Haydn to the court chapel to listen to mass. Scarcely had the two entered the church and found suitable seats when high mass began. The first chords announced a product of Haydn's muse. Our Haydn looked upon it as an accidental occurrence which had happened only to flatter him; nevertheless it was decidedly agreeable to him to listen to his own composition. Toward the close of the mass a person approached and asked him to repair to the oratory, where he was expected. Haydn obeyed and was not a little surprised when he found that the Elector, Maximilian, had had him summoned, took him at once by the hand and presented him to the virtuosi with the words: "Here I make you acquainted with the Haydn whom you all revere so highly." The Elector gave both parties time to become acquainted with each other, and, to give Haydn a convincing proof of his respect, invited him to dinner. This unexpected invitation put Haydn into an embarrassing position, for he and Salomon had ordered a modest little dinner in their lodgings, and it was too late to make a change. Haydn was therefore fain to take refuge in excuses which the Elector accepted as genuine and sufficient. Haydn took his leave and returned to his lodgings, where he was made aware in a special manner of the good will of the Elector, at whose secret command the little dinner had been metamorphosed into a banquet for twelve persons to which the most capable musicians had been invited.

Was the young musician one of these "most capable musicians"? Sunday evening, March 6th, came the performance of Beethoven's music to the "Ritterballet" before noticed; but without his name being known. Bossler's "Musikalische Correspondenz" of July 13, 1791, contains a list of the "Cabinet, Chapel and Court Musicians of the Elector of Cologne." Names designated by an asterisk were "solo players who may justly be ranked with virtuosi"; two asterisks indicated composers. Four names only--those of Joseph Reicha, Perner and the two Rombergs--have the two stars; Beethoven has none. "Hr. Ludwig van Beethoven plays pianoforte concertos; Hr. Neefe plays accompaniments at court and in the theatre and at concerts.... Concertante violas are played by virtuoso violinists"--that is all, except that we learn that the Elector is losing interest in the instrument on which Beethoven played in the orchestra: "His Electoral Highness of Cologne seldom plays the viola nowadays, but finds amusement at the pianoforte with operas, etc., etc."

At Mergentheim, the capital of the Teutonic Order, a grand meeting of commanders and knights took place in the autumn of 1791, the Grand Master Maximilian Francis presiding, and the sessions continuing from September 18 to October 20, as appears from the records at Vienna. The Elector's stay there seems to have been protracted to a period of at least three months. During his visit there of equal length two years before, time probably dragged heavily, so this time ample provision was made for theatrical and musical amusement. Among the visiting theatrical troupes was one called the "Häusslersche Gesellschaft," which played in summer at Nuremberg, in winter in Münster and Eichstädt. The entrepreneur was Baron von Bailaux, the chapelmaster Weber, the elder; and among the personnel were Herr Weber, the younger, and Madame Weber. From Max Weber's biography of his father it appears that these Webers were the brother and sister-in-law of Carl Maria von Weber, then a child of some five years. "The troupe," says the reporter of the "Theater-Kalender," "performs the choicest pieces and the grandest operas." So the father, Franz Anton von Weber, must have found himself at length in his own proper element, and still more so a year later, when he himself became the manager.

This company for a time migrated to Mergentheim and resumed the title of "Kurfürstliches Hoftheater." Beethoven soon came thither also. Did he, when in after years he met Carl Maria von Weber, remember him as a feeble child at Mergentheim? Had his intercourse there with Fridolin von Weber, pupil of Joseph Haydn, any influence upon his determination soon after to become also

that great master's pupil?

AN EXPEDITION UP THE RHINE

Simonetti, Maximilian's favorite and very fine tenor concert-singer, and some twenty-five members of the electoral orchestra, with Franz Ries as conductor--Reicha was too ill--including Beethoven, the two Rombergs and the fine octet of wind-instruments, formed an equally ample provision for the strictly musical entertainments. Actors, singers, musicians--Simonetti and the women-singers excepted--most of them still young, all in their best years and at the age for its full enjoyment, made the journey in two large boats up the Rhine and Main. Before leaving Bonn the company assembled and elected Lux king of the expedition, who in distributing the high offices of his court conferred upon Bernhard Romberg and Ludwig van Beethoven the dignity of, and placed them in his service as, kitchen-boys--scullions. It was the pleasantest season of the year for such a journey, the summer heats being tempered by the coolness of the Rhine and the currents of air passing up and down the deep gorge of the river. Vegetation was at its best and brightest, and the romantic beauty of its old towns and villages had not yet suffered either by the desolations of the wars soon to break upon them or by the resistless and romance-destroying march of "modern improvement." Coblenz and Mayence were still capitals of states, and the huge fortress Rheinfels was not yet a ruin. When Risbeck passed down the Rhine ten years before, his boat "had a mast and sail, a flat deck with a railing, comfortable cabins with windows and some furniture, and in a general way in style was built like a Dutch yacht." In boats like this, no doubt, the jolly company made the slow and, under the circumstances, perhaps, tedious journey against the current of the "arrowy Rhine." But a glorious time and a merry they had of it. Want of speed was no misfortune to them, and in Beethoven's memory the little voyage lived bright and beautiful and was to him "a fruitful source of loveliest visions."

The Bingerloch was then held to be a dangerous, as it certainly was a difficult pass for boats ascending; for here the river, suddenly contracted to half its previous width, plunged amid long lines of rugged rocks into the gorge. So, leaving the boats to their conductors, the party ascended to the Niederwald; and there King Lux raised Beethoven to a higher dignity in his court--Wegeler does not state what it was--and confirmed his appointment by a diploma, or letters patent, dated on the heights above Rüdesheim. To this important document was attached by thread ravelled from a sail, a huge seal of pitch, pressed into the cover of a small box, which gave to the instrument a right imposing look--like the Golden Bull at Frankfort. This diploma from the hand of his comic majesty was among the articles taken by the possessor to Vienna where Wegeler saw it, still carefully preserved, in 1796.

At Aschaffenburg on the Main was the large summer palace of the Electors of Mainz; and here dwelt Abbé Sterkel, now a man of 40 years; a musician from his infancy, one of the first pianists of all Germany and without a rival in this part of it, except perhaps Vogler of Mannheim. His style both as composer and pianist had been refined and cultivated to the utmost, both in Germany and Italy, and his playing was in the highest degree light, graceful, pleasing--as Ries described it to Wegeler, "somewhat ladylike." Ries and Simrock took the young Romberg and Beethoven to pay their respects to the master, "who, complying with the general request, sat himself down to play. Beethoven, who up to this time," says Wegeler, "had not heard a great or celebrated pianoforte player, knew nothing of the finer nuances in the handling of the instrument; his playing was rude and hard. Now he stood with attention all on a strain by the side of Sterkel"; for this grace and delicacy, if not power of execution, which he now heard were a new revelation to him. After Sterkel had finished, the young Bonn concertplayer was invited to take his place at the instrument; but he naturally hesitated to exhibit himself after such a display. The shrewd Abbé, however, brought him to it by a pretence of doubting his ability.

BEETHOVEN'S MEETING WITH STERKEL

A year or two before, Chapelmaster Vincenzo Righini, a colleague of Sterkel in the service of the Elector of Mayence, had published "Dodeci Ariette," one of which, "Vieni (Venni) Amore," was a melody with five vocal variations, to the same accompaniment. Beethoven, taking this melody as his theme, had composed, dedicated to the Countess of Hatzfeld and published twenty-four variations for the pianoforte upon it. Some of these were very difficult, and Sterkel now expressed his doubts if their author could himself play them. His honor thus touched, "Beethoven played not only these variations so far as he could remember them (Sterkel could not find them), but went on with a number of others no less difficult, all to the great surprise of the listeners, perfectly, and in the ingratiating manner that had struck him in Sterkel's playing."[43]

Once in Mergentheim the merry monarch and his jolly subjects had other things to think of and seem to have made a noise in the world in more senses than one. At all events Carl Ludwig Junker, Chaplain at Kirchberg, the residence of Prince Hohenlohe, heard of them and then went over to hear them. Junker was a dilettante composer and the author of some half-dozen small works upon

music--musical almanacs published anonymously, and the like, all now forgotten save by collectors, as are his pianoforte concertos--but at that time he was a man of no small mark in the musical world of Western Germany. He came over to Mergentheim, was treated with great attention by the Elector's musicians, and showed his gratitude in a long letter to Bossler's "Correspondenz" (November 23, 1791), in which superlatives somewhat abound, but which is an exquisite piece of gossip and gives the liveliest picture that exists of the "Kapelle." We have room for only a portion of it:

Here I was also an eye-witness to the esteem and respect in which this chapel stands with the Elector. Just as the rehearsal was to begin Ries was sent for by the Prince, and upon his return brought a bag of gold. "Gentlemen," said he, "this being the Elector's name-day he sends you a present of a thousand thalers." And again, I was eye-witness of this orchestra's surpassing excellence. Herr Winneberger, Kapellmeister at Wallenstein, laid before it a symphony of his own composition, which was by no means easy of execution, especially for the wind-instruments, which had several solos _concertante_. It went finely, however, at the first trial, to the great surprise of the composer. An hour after the dinner-music the concert began. It was opened with a symphony of Mozart; then followed a recitative and air sung by Simonetti; next, a violoncello concerto played by Herr Romberger [Bernhard Romberg]; fourthly, a symphony by Pleyel; fifthly, an air by Righini, sung by Simonetti; sixthly, a double concerto for violin and violoncello played by the two Rombergs; and the closing piece was the symphony of Winneberger, which had very many brilliant passages. The opinion already expressed as to the performance of this orchestra was confirmed. It was not possible to attain a higher degree of exactness. Such perfection in the _pianos_, _fortes_, _rinforzandos_--such a swelling and gradual increase of tone and then such an almost imperceptible dying away, from the most powerful to the lightest accents--all this was formerly to be heard only in Mannheim. It would be difficult to find another orchestra in which the violins and basses are throughout in such excellent hands.... The members of the chapel, almost without exception, are in their best years, glowing with health, men of culture and fine personal appearance. They form truly a fine sight, when one adds the splendid uniform in which the Elector has clothed them--red, and richly trimmed with gold.

I heard also one of the greatest of pianists--the dear, good Bethofen, some compositions by whom appeared in the Spires "Blumenlese" in 1783, written in his eleventh year. True, he did not perform in public, probably the instrument here was not to his mind. It is one of Spath's make, and at Bonn he plays upon one by Steiner. But, what was infinitely preferable to me, I heard him extemporize in private; yes, I was even invited to propose a theme for him to vary. The greatness of this amiable, light-hearted man, as a virtuoso, may in my opinion be safely estimated from his almost inexhaustible wealth of ideas, the altogether characteristic style of expression in his playing, and the great execution which he displays. I know, therefore, no one thing which he lacks, that conduces to the greatness of an artist. I have heard Vogler upon the pianoforte--of his organ playing I say nothing, not having heard him upon that instrument--have often heard him, heard him by the hour together, and never failed to wonder at his astonishing execution; but Bethofen, in addition to the execution, has greater clearness and weight of idea, and more expression--in short, he is more for the heart--equally great, therefore, as an _adagio_ or _allegro_ player. Even the members of this remarkable orchestra are, without exception, his admirers, and all ears when he plays. Yet he is exceedingly modest and free from all pretension. He, however, acknowledged to me, that, upon the journeys which the Elector had enabled him to make, he had seldom found in the playing of the most distinguished virtuosos that excellence which he supposed he had a right to expect. His style of treating his instrument is so different from that usually adopted, that it impresses one with the idea, that by a path of his own discovery he has attained that height of excellence whereon he now stands.

Had I acceded to the pressing entreaties of my friend Bethofen, to which Herr Winterberger added his own, and remained another day in Mergentheim, I have no doubt he would have played to me hours; and the day, thus spent in the society of these two great artists, would have been transformed into a day of the highest bliss.

There is one passage in this exceedingly valuable and interesting letter which, in the present state of knowledge of Beethoven's youth, is utterly inexplicable. It is this: "Yet he is exceedingly modest and free from all pretension. He, however, acknowledged to me that upon the journeys which the Elector had enabled him to make, he had seldom found in the playing of the most distinguished virtuosos that excellence which he supposed he had a right to expect." What were the journeys? Who can tell?

There is but one more to add to these musical reminiscences of that period--another visit of Joseph Haydn, who, having changed the plan of his route, returned in July _via_ Bonn from London to Vienna. The electoral orchestra gave him a breakfast at Godesberg and there Beethoven laid before him a cantata "which received the particular attention of Haydn, who encouraged its author to continue study." It is not improbable that the arrangements were in part now made under which the young composer became a few months later the pupil of the veteran.

Many a eulogy has been written upon Max Franz for his supposed protection of, and favors granted to, the young Beethoven. It has, however, already been made clear that except the gracious reprimand at the time when the singer Heller was made the subject of the boy's joke, all the facts and anecdotes upon which those eulogies are based belong to a much later than the supposed period. The appointment of Beethoven as Chamber Musician (1789) was no distinguishing mark of favor. Half a dozen other youths of his age shared it with him. His being made Court Pianist was a matter of course; for whom had he as a rival? Had he been in any great degree a favorite of the Elector, what need had there been of his receiving from Waldstein, as Wegeler states, "much pecuniary assistance bestowed in such a way as to spare his sensibilities, it being generally looked upon as a small gratuity from the Elector?" One general remark may be made here which has a bearing upon this point, namely: that Beethoven's dedications of important works throughout his life were, as a rule, made to persons from whom he had received, or from whom he had hopes of receiving, pecuniary benefits. Indeed, in one notable case where such a dedication produced him nothing, he never forgot nor forgave the omission. Had he felt that Maximilian was in any single instance really generous toward him, why did he never dedicate any work to him? Why in all the correspondence, private memoranda and recorded conversations, which have been examined for this work, has Beethoven never mentioned him either in terms of gratitude, or in any manner whatever? All idea that his relations to the Elector were different from those of Bernhard Romberg, Franz Ries or Anton Reicha, must be given up. He was organist, pianist, member of the orchestra; and for these services received his pay like others. There is no proof of more, no indication of less.

But with Waldstein, the case was otherwise. The young count, eight years older than Beethoven, coming direct from Vienna, where his family connections gave him access to the salons of the very highest rank of the nobility, was thoroughly acquainted with the noblest and best that the imperial capital could show in the art of music. Himself more than an ordinary dilettante, he could judge of the youth's powers and became his friend. We have seen that he used occasionally to go to the modest room in the Wenzelgasse, that he even employed Beethoven to compose his "Ritterballet" music, and we shall see, that he foretold the future eminence of the composer and that the name, Beethoven, would stand next those of Mozart and Haydn on the roll of fame. Waldstein's name, too, is in Beethoven's roll of fame; it stands in the list of those to whom important works are dedicated. The dedication of the twenty-four variations on "Venni Amore" to the Countess Hatzfeld indicates, if it does not prove, that Beethoven's deserts were neither unknown nor unacknowledged at her house.

At that time the favorite places of resort for the professors of the new university and for young men whose education and position at court or in society were such as to make them welcome guests, was the house on the Market-place now known as the Zehrgarten; and there, says Frau Karth, Beethoven was in the habit of going. A large portion of this house was let in lodgings, and it is said that Eugène Beauharnais, with his wife and children, at one time occupied the first floor. Its mistress was the Widow Koch who spread also a table for a select company of boarders. Her name, too, often appears in the "Intelligenzblatt" of Bonn in advertisements of books and music. Of her three children, a son and two daughters, the beautiful Barbara--the Babette Koch mentioned in a letter of Beethoven's--was the belle of Bonn. Wegeler's eulogy of her ("Notizen," p. 58) contains the names of several members of that circle whom, doubtless, the young composer so often met at the house.

BARBARA KOCH; ELEONORE VON BREUNING

She was a confidential friend of Eleonore von Breuning, a lady who of all the representatives of the female sex that I met in a rather active and long life came nearest the ideal of a perfect woman--an opinion which is confirmed by all who had the good fortune to know her well. She was surrounded not only by young artists like Beethoven, the two Rombergs, Reicha, the twin brothers Kügelchen and others, but also by the intellectual men of all classes and ages, such as D. Crevelt, Prof. Velten, who died early, Fischenich, who afterward became Municipal Councillor, Prof. Thaddäus Dereser, afterward capitular of the cathedral, Wrede, who became a bishop, Heckel and Floret, secretaries of the Elector, Malchus, private secretary of the Austrian minister von Keverberg, later Government Councillor of Holland, Court Councillor von Bourscheidt, Christian von Breuning and many others.

About the time Beethoven left Bonn for Vienna, the wife of Count Anton von Belderbusch, nephew of the deceased minister of that name, had deserted her husband for the embraces of a certain Baron von Lichtenstein, and Babette Koch was engaged as governess and instructress of the motherless children. In process of time Belderbusch obtained a divorce (under the French law) from his adulterous wife and married the governess, August 9, 1802.

BEETHOVEN IN THE BREUNING HOUSE

But it was in the Breuning house that Beethoven enjoyed and profited most. The mother's kindness towards him gave her both the right and the power to urge and compel him to the performance of his duties; and this power over him in his obstinate and passionate moods she possessed in a higher degree than any other person. Wegeler gives an anecdote in point: Baron Westphal von Fürstenberg, until now in the service of the Elector, was appointed minister to the Dutch and Westphalian Circuit and to the courts of Cologne and Trèves, his headquarters being at Bonn. He resided in the large house which is now occupied by the post-office, directly behind the statue of him who was engaged as music teacher in the count's family. The Breuning house was but a few steps distant diagonally across a corner of the square. Here Madame von Breuning was sometimes compelled to use her authority and force the young man to go to his lessons. Knowing that she was watching him he would go, _ut iniquæ mentis asellus_, but sometimes at the very door would turn back and excuse himself on the plea that to-day it was impossible to give a lesson--to-morrow he would give two; to which, as upon other occasions when reasoning with him was of no avail, the good lady would shrug her shoulders with the remark: "He has his _raptus_ again," an expression which the rapt Beethoven never forgot. Most happy was it for him that in Madame von Breuning he had a friend who understood his character thoroughly, who cherished affection for him, who could and did so effectually act as peace-maker when the harmony between him and her children was disturbed. Schindler is a witness that just for this phase of her motherly care Beethoven, down to the close of life, was duly grateful.

In his later days he still called the members of this family his guardian angels of that time and remembered with pleasure the many reprimands which he had received from the lady of the house. "She understood," said he, "how to keep insects off the flowers." By insects he meant certain friendships which had already begun to threaten danger to the natural development of his talent and a proper measure of artistic consciousness by awakening vanity in him by their flatteries. He was already near to considering himself a famous artist, and therefore more inclined to give heed to those who encouraged him in his illusions than such as set before him the fact that he had still to learn everything that makes a master out of a disciple.

This is well said, is very probable in itself, and belongs in the category of facts as to which Schindler is a trustworthy witness.

Stephan von Breuning became so good a violinist as to play occasionally in the electoral orchestra. As he grew older, and the comparative difference in age between him and Beethoven lessened, the acquaintance between them became one of great intimacy. Frau Karth says he was a frequent visitor in the Wenzelgasse, and she had a lively recollection of "the noise they used to make with their music" in the room overhead. Lenz, the youngest of the Breunings, was but fifteen when his teacher left Bonn, but a few years after he became a pupil of Beethoven again in Vienna and became a good pianist. For him the composer seems to have cherished a warm affection, one to which the seven years' difference in their ages gave a peculiar tenderness. It has been supposed that Beethoven at one time indulged a warmer feeling than mere friendship for Eleonore von Breuning; but this idea is utterly unsupported by anything which has been discovered during the inquiries made for this work.

Beethoven's remarkable powers of improvising were often exhibited at the Breuning house. Wegeler has an anecdote here:

Once when Beethoven was improvising at the house of the Breunings (on which occasions he used frequently to be asked to characterize in the music some well-known person) Father Ries was urged to accompany him upon the violin. After some hesitation he consented, and this may have been the first time that two artists improvised a duo.

Beethoven had in common with all men of original and creative genius a strong repugnance to the drudgery of forcing the elements of his art into dull brains and awkward fingers; but that this repugnance was "extraordinary," as Wegeler says, does not appear. A Frau von Bevervörde, one of his Bonn pupils, assured Schindler that she never had any complaint to make of her teacher in respect to either the regularity of his lessons or his general course of instruction. Nor is there anything now to be gathered from the traditions at Vienna which justifies the epithet. Ries's experience is not here in point, for his relations to Beethoven were like those of little Hummel to Mozart. He received such instruction gratis as the master in leisure moments felt disposed to give. There was no pretence of systematic teaching at stated hours. The occasional neglect of a lesson at Baron Westphal's, as detailed in the anecdote above given, may be explained on other ground than that of extraordinary repugnance to teaching. Beethoven was, in 1791-'92, just at the age when the desire for distinction was fresh and strong; he was conscious of powers still not fully developed; his path was diverse from that of the other young men with whom he associated and who, from all that can be gathered now on the subject, had little faith in that which he had chosen. He must have felt the necessity of other instruction, or, at all events, of better opportunities to compare his powers with those of others, to measure himself by a higher standard, to try the effect of his compositions in another sphere, to satisfy himself that his instincts as a composer were true and that his deviations from the beaten track were not wild and capricious. Waldstein, we know from Wegeler (and this is confirmed by his own words), had faith in him and his works, and it will be seen that another, Fischenich, had also. But what would be said of him and his compositions in the city of

Mozart, Haydn, Gluck? To this add the restlessness of an ambitious youth to whom the routine of duties, which must long since in great measure have lost the charm of novelty, had become tedious, and the natural longing of young men for the great world, for a wider field of action, had grown almost insupportable.

BEETHOVEN'S SWEETHEARTS IN BONN

Or Beethoven's _raptus_ may just then have had a very different origin; Jeannette d'Honrath, or Fräulein Westerhold, was perhaps the innocent cause--two young ladies whose names are preserved by Wegeler of the many for whom he says his friend at various times indulged transient, but not the less ardent, passions. The former was from Cologne, whence she occasionally came to Bonn to pass a few weeks with Eleonore von Breuning.

"She was a beautiful, vivacious blond, of good education," says Wegeler, "and amiable disposition, who enjoyed music greatly and possessed an agreeable voice; wherefore she several times teased our friend by singing a song, familiar at the time, beginning:

'Mich heute noch von dir zu trennen Und dieses nicht verhindern können, Ist zu empfindlich für mein Herz!'

for the favored rival was the Austrian recruiting officer in Cologne, Carl Greth, who married the young lady and died on October 15, 1827, as Field Marshal General, Commander of the 23rd Regiment of Infantry and Commandant at Temesvar."[44]

The passion for Miss d'Honrath was eclipsed by a subsequent fancy for a Fräulein von Westerhold. The Court Calendars of these years name "Hochfürstlich Münsterischer Obrist-Stallmeister, Sr. Excellenz der Hochwohlgeborne Herr Friedrich Rudolph Anton, Freyherr von Westerhold-Giesenberg, kurkölnischer und Hochstift-Münsterischer Geheimrath." This much betitled man, according to Neefe (Spazier's "Berlin. Mus. Zeitung"),

played the bassoon himself and maintained a fair band among his servants, particularly players of wind-instruments. He had two sons, one of whom was a master of the flute, and two daughters. The elder daughter--the younger was still a child--Maria Anna Wilhelmine, was born on July 24, 1774, married Baron Friedrich Clemens von Elverfeldt, called von Beverföde-Werries, on April 24, 1792, and died on November 3, 1852. She was an excellent pianist. In Münster, Neefe heard "the fiery Mad. von Elverfeldt play a difficult sonata by Sardi (not Sarti) with a rapidity and accuracy that were marvellous."

It is not surprising that Beethoven's talent should have met with recognition and appreciation in this musical family. He became the young woman's teacher, and as the chief equerry Count Westerhold had to accompany the Elector on his visits to Münster, where, moreover, he owned a house, there is a tradition in the family that young Beethoven went with them before the young lady's marriage in 1790. She it was with whom Beethoven was now in love. He had the disease violently, nor did he "let concealment, like a worm i' th' bud," feed upon his cheek. Forty years afterward Bernhard Romberg had anecdotes to relate of this "Werther love."

The strong doubt that any such feeling for Eleonore von Breuning was ever cherished by Beethoven has already been expressed. The letters to her from Vienna printed by Wegeler, and other correspondence still in manuscript, confirm this doubt by their general tone; but that a really warm friendship existed between them and continued down to the close of his life, with a single interruption just before he left Bonn, of the cause of which nothing is known, so much is certain. Among the few souvenirs of youthful friendship which he preserved was the following compliment to him on his twentieth birthday, surrounded by a wreath of flowers:

ZU B'S GEBURTSTAG VON SEINER SCHÜLERIN.

Glück und langes Leben Wünsch ich heute dir; Aber auch daneben Wünsch ich etwas mir!

Mir in Rücksicht deiner Wünsch ich deine Huld, Dir in Rücksicht meiner Nachsicht und Geduld.

1790

Von Ihrer Freundin u. Schülerin Lorchen von Breuning.[45]

Another was a silhouette of Fräulein von Breuning. Referring to Beethoven's allusion to this in a letter to Wegeler (1825) the latter says: "In two evenings the silhouettes of all the members of the von Breuning family and more intimate friends of the house, were made by the painter Neesen of Bonn. In this way I came into the possession of that of Beethoven which is here printed. Beethoven was probably in his sixteenth year at the time";--far more probably in his nineteenth, the reader will say.

To the point of Beethoven's susceptibility to the tender passion let Wegeler again be cited:

The truth as I learned to know it, and also my brother-in-law Stephan von Breuning, Ferdinand Ries, and Bernhard Romberg, is that there was never a time when Beethoven was not in love, and that in the highest degree. These passions, for the Misses d'Honrath and Westerhold, fell in his transition period from youth to manhood, and left impressions as little deep as were those made upon the beauties who had caused them. In Vienna, at all events so long as I lived there, Beethoven was always in love and occasionally made a conquest which would have been very difficult if not impossible for many an Adonis.

A review of some of the last pages shows that for the most part after 1789 the life of Beethoven was a busy one, but that the frequent absences of the Elector, as recorded in the newspapers of the day, left many a period of considerable duration during which, except for the meetings of the orchestra for rehearsal and study, he had full command of his time. Thus he had plenty of leisure hours and weeks to devote to composition, to instruction in music, for social intercourse, for visits to Kerpen and other neighboring places, for the indulgence of his strong propensity to ramble in the fields and among the mountains, for the cultivation in that beautiful Rhine region of his warm passion for nature.

The new relations to his father and brothers, as virtual head of the family, were such as to relieve his mind from anxiety on their account. His position in society, too, had become one of which he might justly be proud, owing, as it was, to no adventitious circumstances, but simply to his genius and high personal character. Of illness in those years we hear nothing, except Wegeler's remark ("Notizen," 11): "When the famous organist Abbé Vogler played in Bonn (1790 or 1791) I sat beside Beethoven's sickbed"; a mere passing attack, or Wegeler would have vouchsafed it a more extended notice in his subsequent remarks upon his friend's health. Thus these were evidently happy years, in spite of certain characteristic and gloomy expressions of Beethoven in letters hereafter to be given, and years of active intellectual, artistic and moral development.

THE SUGGESTION OF HAYDN AS TEACHER

The probability that in July, 1792, it had been proposed to Haydn to take Beethoven as a pupil has been mentioned; but it is pretty certain that the suggestion did not come from the Elector, who, there is little doubt, was in Frankfort at the coronation of his nephew Emperor Franz (July 14) at the time of Haydn's visit. The indefatigable Karajan[46] is unable to determine precisely when the composer left London or reached Vienna; but it is known he was in the former city after July 1st and in the latter before August 4th. Whatever arrangements may have been made between the pupil and master, they were subject to the will of the Elector, and here Waldstein may well have exerted himself to his protégé's advantage. At all events, the result was favorable and the journey determined upon. Perhaps, had Haydn found Maximilian in Bonn, he might have taken the young man with him; as it was, some months elapsed before his pupil could follow.

Some little space must be devoted to the question, whence the pecuniary resources for so expensive a journey to and sojourn in Vienna were derived. The good-hearted Neefe did not forget to record the event in very flattering terms when he wrote next year in Spazier's "Berliner Musik-Zeitung":

In November of last year Ludwig van Beethoven, assistant court organist and unquestionably now one of the foremost pianoforte players, went to Vienna _at the expense of our Elector_ to Haydn in order to perfect himself under his direction more fully in the art of composition.

In a note he adds:

Inasmuch as this L. v. B. according to several reports is said to be making great progress in art and owes a part of his education to Herr Neefe in Bonn, to whom he has expressed his gratitude in writing, it may be well (Herr N's modesty interposing no objection) to append a few words here, since, moreover, they redound to the credit of Herr B.: "I thank you for your counsel very often given me in the course of my progress in my divine art. If ever I become a great man, yours will be some of the credit. This will give you the greater pleasure, since you can remain convinced, etc."

THE LIMIT OF MAXIMILIAN'S FAVOR

"At the expense of our Elector"--so says Neefe; so, too, Fischenich says of Beethoven "whom the Elector has sent to Haydn in Vienna." Maximilian, then, had determined to show favor to the young musician. This idea is confirmed by Beethoven's noting, in the small memorandum book previously referred to, the reception soon after reaching Vienna of 25 ducats and his disappointment that the sum had not been a hundred. (A receipt for his salary, 25 th. for the last quarter of this year, still in the Düsseldorf archives, is dated October 22, and seems at first sight to prove an advance per favor; but many others in the same collection show that payments were usually made about the beginning of the second month of each quarter.) There is also a paper in the Düsseldorf

collection, undated, but clearly only a year or two after Beethoven's departure, by which important changes are made in the salaries of the Elector's musicians. In this list Beethoven does not appear among those paid from the _Landrentmeisterei_ (i.e., the revenues of the state), but is to receive from the _Chatouille_ (privy purse) 600 florins--a sum equivalent to the hundred ducats which he had expected in vain. It is true these changes were never carried out, but the paper shows the Elector's intentions.

With such facts before us, how is Beethoven to be relieved of the odium of ingratitude to his benefactor? By the circumstance that, for anything that appears, the good intentions of the Elector--excepting in an increase of salary hereafter to be noted, and the transmission of the 25 ducats--were never carried out; and the young musician, after receiving his quarterly payment two or three times, was left entirely dependent upon his own resources. Maximilian's justification lies in the sea of troubles by which he was so soon to be overwhelmed.

That the 100 ducats were not advanced to Beethoven before leaving Bonn is easily accounted for. In October, 1792, the French revolutionary armies were approaching the Rhine. On the 22nd they entered Mayence; on the 24th and 25th the archives and funds of the court at Bonn were packed up and conveyed down the Rhine. On the 31st the Elector, accompanied by the Prince of Neuwied, reached Cleve on his first flight from his capital. It was a time of terror. All the principal towns of the Rhine region, Trèves, Coblenz, etc., even Cologne, were deserted by the higher classes of the inhabitants. Perhaps it was owing to this that Beethoven obtained permission to leave Bonn for Vienna just then instead of waiting until the approaching theatrical and musical season had passed. But with the treasury removed to Düsseldorf, he had to content himself with just sufficient funds to pay his way to Vienna and the promise of more to be forwarded thither.

Beethoven's departure from Bonn called forth lively interest on the part of his friends. The plan did not contemplate a long sojourn in the Austrian capital; it was his purpose, after completing his studies there, to return to Bonn and thence to go forth on artistic tours.[47] This is proved by an autograph album dating from his last days in Bonn, which some of his intimate friends, obviously those with whom he was wont to associate at the Zehrgarten, sent with him on his way, now preserved in the Imperial Library at Vienna. The majority of the names are familiar to us, but many which one might have expected to find, notably those of the musicians of Bonn, are missing. Eleonore von Breuning's contribution was a quotation from Herder:

Freundschaft, mit dem Guten, Wächset wie der Abendschatten, Bis des Lebens Sonne sinkt.[48]

Bonn, den 1. November Ihre wahre Freundin Eleonore 1792 Breuning.

Most interesting of all the inscriptions in the album, however, is that of Count Waldstein, which was first published by Schindler (Vol. I, p. 18) from a copy procured for him by Aloys Fuchs. It proves how great were the writer's hopes, how strong his faith in Beethoven:

Dear Beethoven! You are going to Vienna in fulfillment of your long-frustrated wishes. The Genius of Mozart is mourning and weeping over the death of her pupil. She found a refuge but no occupation with the inexhaustible Haydn; through him she wishes to form a union with another. With the help of assiduous labor you shall receive _Mozart's spirit from Haydn's hands_.

Your true friend Waldstein.

Bonn, October 29, 1792.

The dates in the album prove that Beethoven was still in Bonn on November 1, 1792, and indicate that it was the last day of his sojourn there. In Duten's "Journal of Travels," as translated and augmented by John Highmore, Gent. (London, 1782)--a Baedeker's or Murray's handbook of that time--the post-road from Bonn to Frankfort-on-the-Main is laid down as passing along the Rhine _via_ Andernach to Coblenz, and thence, crossing the river at Ehrenbreitstein, _via_ Montabaur, Limburg, Würges and Königstein;--corresponding to the route advertised in the "Intelligenzblatt" a few years later--time 25 hours, 43 minutes.

THE JOURNEY TO VIENNA

This was the route taken by Beethoven and some unknown companion. Starting from Bonn at 6 a.m. they would, according to Dutens and Highmore, dine at Coblenz about 3 p.m. and be in Frankfort about 7 next morning.

The first three pages of the memorandum book above cited contain a record of the expenses of this journey as far as Würges. One of the items is this: "Trinkgeld (_pourboire_) at Coblenz because the fellow drove like the devil right through the Hessian army at the risk of a cudgelling, one small thaler." This army marched from Coblenz on November 5; but on the same day a French corps,

having advanced from Mayence beyond Limburg, took possession of Weilburg. The travellers could not, therefore, have journeyed through Limburg later than the night of the 3rd. We conclude, then, that it was between November 1st and 3rd that Beethoven bade farewell to Bonn, and at Ehrenbreitstein saw Father Rhine for the last time.

The temptation is too strong to be resisted to add here the contents of the three pages of the memorandum book devoted to this journey, and the reasonings--fancies, if the reader prefers the term--drawn from them, upon which is founded the assertion that Beethoven had a travelling companion. This is probable in itself, and is confirmed by, first, two handwritings; second, the price paid for post-horses (thus, the first entry is for a station and a quarter at 50 _Stüber_, the regular price being one florin, or 40 _Stüber_ per horse for a single passenger; there were, therefore, two horses and 10 _Stüber_ extra per post for the second passenger); third, the word “us” in the record of the _Trinkgeld_ at Coblenz; fourth, the accounts cease at Würges, but they would naturally have been continued to Vienna had they been noted down by Beethoven from motives of economy; fifth, the payment of 2 fl. for dinner and supper is certainly more than a young man, not overburdened with money, would in those days have spent at the post-house.

We may suppose, then, that the companions have reached the end of their journey in common, and sit down to compute and divide the expenses. Beethoven hands his blank-book to his friend, who writes thus:

(Page 1) From Bonn to Remagen, 1-1/4 Stat, at 50 Stbr. 3 fl. From Remag. to Andernach, 1-1/2 St. 3.45 Tip 45 Tolls 45 From Andernach to Coblenz, 1 St. 3. Tips to Andernach 50 „ to Coblenz Tolls to Andernach 42 Tolls to Coblenz

These last three items are not carried out, and Beethoven now takes the book and adds the items of the “Tolls to Andernach” thus:

Sinzig 7 St(über) Reinicke 5 St. Preissig 10 St. Norich 4-1/2 St.

These 26 Stüber, changed into Kreutzers, make up the 42 in the column above. On the next page he continues:

(Page 2) Coblenz, tolls 30 x Rothehahnen (Red Cocks) 24 x Coblenz to Montebaur 2 rthlr. and 1/2 d Tolls for Coblenz 48 x Tip because the fellow drove like the devil right through the Hessian army at the risk of a cudgelling one small thaler Ate dinner 2 fl. Post from Montebaur to Limburg 3 fl. 57 x 10 x road money 15 x „ „

(Page 3) Supper 2 fl. in Limburg 12 Batzen Tips 14 x Grease money 14 x Tip for postillion 1 fl.

The other hand now writes:

The same money for meals and tips, besides 12 x road money to Wirges.

The entries of the second and third pages are now changed into florin currency and brought together, making 22 fl. and 14 x; add the expenses on the first page to this sum and we have a total of about 35 fl. from Bonn to Würges for two young men travelling day and night, and no doubt as economically as was possible.

The next entries are by Beethoven’s hand in Vienna, and we are left to imagine his arrival in Frankfort and his departure thence _via_ Nuremberg, Regensburg, Passau and Linz in the public post-coach for Vienna. Proof will be found hereafter that he was in that city on or before November 10th, and that Schindler (Vol. I, p. 19) therefore confounds this journey with that of 1787, and is all wrong when he says “they travelled very slowly and the money which they had taken along was exhausted before they had traversed half the journey.”

FOOTNOTES:

[43] Wegeler’s story of the meeting between Beethoven and Sterkel is confirmed in every detail by a letter from N. Simrock to Schindler, a copy of which was found among the posthumous papers of Thayer.

[44] In one of the Beethoven conversation books, _anno_ 1823, may be read in Schindler’s handwriting: “Captain v. Greth’s address, Commandant in Temesvar.”

[45] From the Fischoff Manuscript. The verbal play can scarcely be given in English rhymed couplets. The sentiment is: “Happiness and long life I wish you to-day, but something do I crave for myself from you--your regard, your forbearance and your patience.”

[46] “J. Haydn in London,” page 53.

[47] Neefe relates that on his second visit to England, Haydn had contemplated taking Beethoven with him.

[48] “Friendship, with that which is good, grows like the evening shadow till the setting of the sun of life.”

Chapter X

Beethoven’s Creative Activity in Bonn--An Inquiry into the Genesis of Many Compositions--The Cantatas on the Death of Joseph II and the Elevation of Leopold II--Songs, the “Ritterballet,” the Octet and Other Chamber Pieces.

But for the outbreak of the French Revolution, Bonn seems to have been destined to become a brilliant centre of learning and art. Owing to the Elector’s taste and love for music, that art became--what under the influence of Goethe poetry and drama were in Weimar--the artistic expression and embodiment of the intellectual character of the time. In this art, among musicians and composers, Beethoven, endowed with a genius whose originality has rarely if ever been surpassed, “lived, moved and had his being.” His official superiors, Lucchesi, Reicha, Neefe, were indefatigable in their labors for the church, the stage and the concert-room; his companions, Andreas Perner, Anton Reicha, the Rombergs, were prolific in all the forms of composition from the set of variations to even the opera and oratorios; and in the performance of their productions, as organist, pianist and viola player, he, of course, assisted. The trophies of Miltiades allowed no rest to Themistocles. Did the applause bestowed upon the scenes, duos, trios, quartets, symphonies, operas of his friends awaken no spirit of emulation in him? Was he contented to be the mere performer, leaving composition to others? And yet what a “beggarly account” is the list of compositions known to belong to this period of his life![49] Calling to mind the activity of others, particularly Mozart, developed in their boyhood, and reflecting on the incentives which were offered to Beethoven in Bonn, one may well marvel at the small number and the small significance of the compositions which preceded the Trios Op. 1, with which, at the age of 24 years, he first presented himself to the world as a finished artist. But a change has come over the picture in the progress of time. Not only are the beginnings of many works which he presented to the world at a late day as the ripe products of his genius to be traced back to the Bonn period; fate has also made known to us compositions of his youth which, for a long time, were lost in whole or in part, and which, in connection with the three great pianoforte quartets of 1785, not only disclose a steady progress, but also discover the self-developed individual artist at a much earlier date than has heretofore been accepted. Now that we are again in possession of the cantatas and other fruits of the Bonn period, or have learned to know them better as such, we are able to free ourselves from the old notion which presented Beethoven as a slowly and tardily developed master.

CANTATA ON THE DEATH OF JOSEPH II

The most interesting of Beethoven’s compositions in the Bonn period are unquestionably the cantatas on the death of Joseph II and the elevation of Leopold II. Beethoven did not bring them either to performance or publication; they were dead to the world. Nottebohm called attention to the fact that manuscript copies of their scores were announced in the auction catalogue of the library of Baron de Beine in April, 1813. It seems probable that Hummel purchased them at that time; at any rate, after his death they found their way from his estate into the second-hand bookshop of List and Francke in Leipsic, where they were bought in 1884 by Armin Fridmann of Vienna. Dr. Eduard Hanslick acquainted the world with the rediscovered treasures in a feuilleton published in the “Neue Freie Presse” newspaper of Vienna on May 13, 1884, and the funeral cantata was performed for the first time at Vienna in November, 1884, and at Bonn on June 29, 1885.[50] Both cantatas were then included in the Complete Works of Beethoven published by Breitkopf and Härtel. The “Cantata on the Death of Joseph the Second, composed by L. van Beethoven,” was written between March and June, 1790. The Emperor died on February 20th, and the news of his death reached Bonn on February 24th. The Lesegesellschaft at once planned a memorial celebration, which took place on March 19th. At a meeting held to make preparations for the function on February 28, Prof. Eulogius Schneider (who delivered the memorial address) expressed the wish that a musical feature be incorporated in the programme and said that a young poet had that day placed a poem in his hands which only needed a setting from one of the excellent musicians who were members of the society or a composer from elsewhere. Beethoven’s most influential friends, at the head of them Count Waldstein, were members of the society. Here, therefore, we have beyond doubt the story of how Beethoven’s composition originated. The minutes of the last meeting for preparation, held on March 17, state that “for various reasons the proposed cantata cannot be performed.” Among the various reasons may have been the excessive difficulty of the parts for the wind-instruments which, according to Wegeler, frustrated a projected performance at Mergentheim; though it is also possible that Beethoven, who was notoriously a slow worker, was unable to complete the music in the short time which was at his disposal. The text of the cantata was written by Severin Anton Averdonk, son of an employee of the electoral Bureau of Accounts, and brother of the court singer Johanna Helene Averdonk, who, in her youth, was for a space a pupil of Johann van Beethoven. Beethoven set the young poet’s ode for solo voice, chorus and orchestra without trumpets and drums. Brahms, on playing through the score, remarked: “It is Beethoven through and through. Even if there were no name on the

title-page none other than that of Beethoven could be conjectured." The same thing may be said of the "Cantata on the Elevation of Leopold II to the Imperial Dignity, composed by L. V. Beethoven." Leopold's election as Roman Emperor took place on September 30, 1790, his coronation on October 9, when Elector Max Franz was present at Frankfort. This gives us a hint as to the date of the composition. Whether or not the Elector commissioned it cannot be said. Averdonk was again the poet. The two cantatas mark the culmination of Beethoven's creative labors in Bonn; they show his artistic individuality ripened and a sovereign command of all the elements which Bonn was able to teach him from a technical point of view.

OTHER WORKS OF THE BONN PERIOD

Two airs for bass voice with orchestral accompaniment are, to judge by the handwriting, also to be ascribed to about 1790. The first is entitled "'Prüfung des Küssens' ('The Test of Kissing'), V. L. V. Beethowen." The use of the "w" instead of the "v" in the spelling of the name points to an early period for the composition. The text of the second bears the title, "Mit Mädeln sich vertragen," and was taken by Beethoven from the original version of Goethe's "Claudine von Villa Bella." Paper, handwriting and the spelling of the name of the composer indicate the same period as the first air. The two compositions remained unknown a long time, but are now to be had in the Supplement to the Complete Works published by Breitkopf and Härtel.

To these airs must be added a considerable number of songs as fruits of Beethoven's creative labors in Bonn. The first of these, "Ich, der mit flatterndem Sinn," was made known by publication in the Complete Works. A sketch found among sketches for the variations on "Se vuol ballare," led Nottebohm to set down 1792 as the year of its origin. Of the songs grouped and published as Op. 52 the second, "Feuerfarbe," belongs to the period of transition from Bonn to Vienna. On January 26, 1793, Fischenich wrote to Charlotte von Schiller: "I am enclosing with this a setting of the 'Feuerfarbe' on which I should like to have your opinion. It is by a young man of this place whose musical talents are universally praised and whom the Elector has sent to Haydn in Vienna. He proposes also to compose Schiller's 'Freude,' and indeed strophe by strophe. Ordinarily he does not trouble himself with such trifles as the enclosed, which he wrote at the request of a lady." From this it is fair to conclude that the song was finished before Beethoven's departure from Bonn. Later he wrote a new postlude, which is found among _motivi_ for the Octet and the Trio in C minor. Of the other songs in Op. 52 the origin of several may be set down as falling in the Bonn period. That of the first, "Urian's Reise um die Welt," we have already seen. Whether or not these songs, which met with severe criticism in comparison with other greater works of Beethoven, were published without Beethoven's knowledge, is doubtful.[51] Probability places the following songs in the period of transition, or just before it: "An Minna," sketched on a page with "Feuerfarbe," and other works written out in the early days of the Vienna period; a drinking-song, "to be sung at parting," "Erhebt das Glas mit froher Hand," to judge by the handwriting, an early work, presumably _circa_ 1787; "Elegie auf den Tod eines Pudels"; "Die Klage," to be placed in 1790, inasmuch as the original manuscript form appears simultaneously with sketches of the funeral cantata; "Wer ist ein freier Mann?", whose original autograph in the British Museum bears the inscription "ipse fecit L. v. Beethoven," and must be placed not later than 1790, while a revised form is probably a product of 1795, and to a third Wegeler appended a different text, "Was ist des Maurer's Ziel?" published in 1806; the "Punschlied" may be a trifle older; the autograph of "Man strebt die Flamme zu verhehlen," in the possession of the Gesellschaft der Musikfreunde, which has been placed in the year 1792, bears in Beethoven's handwriting the words "pour Madame Weissenthurn par Louis van Beethoven." Madame Weissenthurn was a writer and actress, and from 1789 a member of the company of the Burgtheater in Vienna, and it is more than likely that Beethoven did not get acquainted with her till he went to Vienna, although she was born on the Rhine.

Turn we now to the instrumental works which date back to the Bonn period. The beginning is made with the work which, in a manner, first brought Beethoven into close relationship with the stage--the "Ritterballet," produced by the nobility on Carnival Sunday, March 6, 1791, and which, consequently, cannot have been composed long before, say in 1790 or 1791. The ballet was designed by Count Waldstein in connection with Habich, a dancing-master from Aix-la-Chapelle. Of the contents of the piece we know nothing more than is contained in the report from Bonn printed three chapters back, namely, that it illustrated the predilection of the ancient Germans for war, the chase, love and drinking; the music, being without words, can give us no further help. It consists of eight short numbers, designed to accompany the pantomime: 1, March; 2, German Song;[52] 3, Hunting Song; 4, Romance; 5, War Song; 6, Drinking Song; 7, German Dance; 8, Coda. It was intended that the music should be accepted as Waldstein's and, therefore, Beethoven never published it.

It seems as if the last year of Beethoven's sojourn in Bonn was especially influential in the development of his artistic character and ability. Of the works of 1792, besides trifles, there were two of larger dimensions which, if we were not better advised, would unhesitatingly be placed in the riper Vienna period. The autograph of the Octet for wind-instruments, published after the composer's death and designated at a later date as Op. 103, bears the inscription "Parthia in Es" (above this, "dans un Concert"),

“Due Oboe, Due Clarinetti, Due Corni, Due Fagotti di L. v. Beethoven.” From a sketch which precedes suggestions for the song “Feuerfarbe,” Nottebohm concludes that the Octet was composed in 1792, or, at the latest in 1793. In the latter case it would be a Viennese product. It is improbable, however, that Beethoven found either incentive or occasion soon after reaching Vienna to write a piece of this character, and it is significant that in his later years he never returned to a combination of eight instruments. But there was an incentive in Bonn in the form of the excellent dinner-music of the Elector described by Chaplain Junker, which was performed by two oboes, two clarinets, two horns and two bassoons. It may be set down as a fruit of 1792, his last year in Bonn. For the same combination of instruments, Beethoven also composed a Rondino in E-flat, published in 1829 by Diabelli, probably from the posthumous manuscript. From the autograph Nottebohm argued that it was written in Bonn, and what has been said of the origin of the Octet applies also to the Rondino. The autograph of a little duet in G for two flutes bears the inscription: “For Friend Degenharth by L. v. Beethoven. August 23rd, 1792, midnight.”

We are lifted to a higher plane again by a work which in invention and construction surpasses the compositions already mentioned and still to be mentioned in the present category, and discloses the fully developed Beethoven as we know him--the Trio in E-flat, for violin, viola and violoncello, Op. 3. Its publication was announced by Artaria in February, 1797. According to Wegeler, Beethoven was commissioned by Count Appony in 1795 to write a quartet. He made two efforts, but produced first a Trio (Op. 3), and then a Quintet (Op. 4). We know better the origin of the latter work now; but Wegeler is also mistaken about the origin of the Trio; it was a Bonn product. Here the proof:

At the general flight from Bonn, whether the one at the end of October or that of December 15, 1793, the Elector ordered his chaplain, Abbé Clemens Dobbeler, to accompany an English lady, the Honourable Mrs. Bowater, to Hamburg. “While there,” says William Gardiner in his “Music and Friends,” III, 142, “he was declared an emigrant and his property was seized. Luckily he placed some money in our (English) government funds, and his only alternative was to proceed to England.” Dobbeler accompanied Mrs. Bowater to Leicester. She,

having lived much in Germany, had acquired a fine taste in music; and as the Abbé was a very fine performer on the violin, music was essential to fill up this irksome period (while Mrs. Bowater lived in lodgings before moving into old Dolby Hall). My company was sought with that of two of my friends to make up occasionally an instrumental quartett.... Our music consisted of the Quartetts of Haydn, Boccherini, and Wranizky. The Abbé, who never travelled without his violin, had luckily put into his fiddle-case a Trio composed by Beethoven, just before he set off, which thus, in the year 1793, found its way to Leicester. This composition, so different from anything I had ever heard, awakened in me a new sense, a new delight in the science of sounds.... When I went to town (London) I enquired for the works of this author, but could learn nothing more than that he was considered a madman and that his music was like himself. However, I had a friend in Hamburg through whom, although the war was raging at the time, I occasionally obtained some of these inestimable treasures.

THE TRIO FOR STRINGS, OP. 3

What trio was this so praised by the enthusiastic Englishman? On the last page but one of Gardiner’s “Italy, her Music, Arts and People” he writes, speaking of his return down the Rhine:

Recently we arrived at Bonn, the birthplace of Beethoven. About the year 1786, my friend the Abbé Dobler, chaplain to the Elector of Cologne, first noticed this curly, blackheaded boy, the son of a tenor singer in the cathedral. Through the Abbé I became acquainted with the first production of this wonderful composer. How great was my surprise in playing the viola part to his Trio in E-flat, so unlike anything I had ever heard. It was a new sense to me, an intellectual pleasure which I had never received from sounds.

Again, in a letter to Beethoven, Gardiner says, “Your Trio in E-flat (for violin, viola and bass).” To all but the blind this narrative pours a flood of light upon the whole question.[53]

There come up now for consideration the compositions in which Beethoven’s principal instrument, the pianoforte, is employed. They carry us back a space, and to the earliest examples we add a related composition for violin.

It was a part of Beethoven’s official duty to play pianoforte before the Elector, and it may therefore easily be imagined that after his first boyish attempt in 1784, he would continue to compose concertos and parts of concertos for the pianoforte and orchestra, and not wait until 1795, when he publicly performed the “entirely new” concerto in B-flat. Quite recently the world has learned of a first movement for a pianoforte concerto in D, concerning which the first report was made by Guido Adler in 1888, and which was

performed in Vienna on April 7, 1889, and then incorporated, as edited by Adler, in the supplement to the Complete Works. It was discovered in copy, solo and orchestra parts, in the possession of Joseph Bezeczny, the head of an educational institution for the blind in Prague, and the handwriting is his. Immediately after its first performance its authenticity was questioned by Dr. Paumgartner, who called attention to its Mozartian characteristics, but failed to advance any reason for doubting the testimony of so thorough a musical scholar as Adler. The latter had emphasized the resemblances to Mozart's works, which, indeed, are too obvious to escape attention; but for a long time after 1785, especially after Beethoven met Mozart personally in Vienna, the former was completely in the latter's thrall, and that his music should occasionally be reminiscent of his model is not at all singular. Such reminiscences are to be found in the quartets of 1785 and the trio for pianoforte and wind-instruments. It is safe to assume that the movement was written, as Adler suggests, in the period 1788-1793, perhaps before rather than after 1790, and that Beethoven attached little value to it and laid it permanently aside.

A companion-piece to this movement is the fragment of a Concerto for Violin in C major, of which the autograph is in the archives of the Gesellschaft der Musikfreunde in Vienna, the handwriting of which indicates that it belongs to the early Vienna if not the Bonn period. That it is a first transcription is indicated by the fact that there are many erasures and corrections. The fragment contains 259 measures, embracing the orchestral introduction, the first solo passage, the second _tutti_ and the beginning of the free fantasia for the solo instrument; it ends with the introduction of a new transition _motif_ which leads to the conjecture that the movement was finished and that the missing portion has been lost.[54]

A Trio in E-flat for Pianoforte, Violin and Violoncello, found among Beethoven's posthumous papers, was published in 1836 by Dunst in Frankfort-on-the-Main. On the original publication its authenticity was certified to by Diabelli, Czerny and Ferdinand Ries, and it was stated that the original manuscript was in the possession of Schindler; Wegeler verified the handwriting as that of Beethoven. Schindler cites Beethoven's utterance that he had written the work at the age of 15 years and described it as one of his "highest strivings in the free style of composition," which was either a misunderstanding of Schindler's or a bit of irony on the part of Beethoven. Nearer the truth, at any rate, is a remark in Gräffer's written catalogue of Beethoven's works: "Composed _anno_ 1791, and originally intended for the three trios, Op. 1, but omitted as too weak by Beethoven." Whether or not this observation rests on an authentic source is not stated.[55]

Whether or not the Pianoforte Trios, Op. 1, were composed in Bonn may be left without discussion here, since we shall be obliged to recur to the subject later. The facts about them that have been determined beyond controversy are, that they were published in 1795; were not ready in their final shape in 1794; and were already played in the presence of Haydn in 1793.

OTHER WORKS COMPOSED IN BONN

The Variations in E-flat for Pianoforte, Violin and Violoncello, which were published in 1804 by Hofmeister in Leipsic as Op. 44, apparently belong to the last year of Beethoven's life in Bonn. Nottebohm found a sketch of the work alongside one of the song "Feuerfarbe," which fact points to the year 1792; Beethoven in a letter to the publisher appears not to have laid particular store by it, a circumstance easily understood in view of the great works which had followed the youthful effort.

Besides these compositions, a Trio for Pianoforte, Flute and Bassoon,[56] concerning which all the information which we have came from the catalogue of Beethoven's effects sold at auction, has recently been published. It is No. 179 in the catalogue, where it is described as a composition of the Bonn period. On the autograph, preserved in Berlin, the title, placed at the end, is "Trio concertante a clavicembalo, flauto, fagotto, composto da Ludovico van Beethoven organista di S. S. (illegible word), cologne." The designation of the composer as organist, etc., fixes the place of its origin, and the handwriting indicates an early date.

Among the papers found in Beethoven's apartments after his death, was the manuscript of a Sonata in B-flat for Pianoforte and Flute, which passed into the hands of Artaria. It is not in Beethoven's handwriting, and the little evidence of its authenticity is not convincing.[57]

It is more than likely that the Variations for Pianoforte and Violin on Mozart's "Se vuol ballare" ought to be assigned to the latter part of the Bonn period. They were published in July, 1793, with a dedication to Eleonore von Breuning, to whom Beethoven sent the composition with a letter dated November 2, 1793.[58] The dedication leads to the presumption that the work was carried to Vienna in a finished state and there subjected to only the final polish. The postscript to the letter to Fräulein von Breuning betrays the reason for the hurried publication: Beethoven wanted to checkmate certain Viennese pianists whom he had detected copying peculiarities of his playing in improvisation which he suspected they would publish as their own devices.

Besides the pieces already mentioned, Beethoven wrote the following works for pianoforte in Bonn:

1. A Prelude in F minor.[59] According to a remark on a printed copy shown to be authentic, Beethoven wrote it when he was 15 year old, that is, in 1786 or, the question of his age not being determined at the time, 1787. The prelude is, as a matter of fact, a fruit of his studies in the art of imitation; and the initiative, probably, came from Bach's Preludes.

2. Two Preludes through the Twelve Major Keys for Pianoforte or Organ; published by Hoffmeister in 1803 as Op. 39. Obviously exercises written for Neefe while he was Beethoven's teacher in composition.

3. Variations on the arietta "Venni Amore," by Righini, in D major--"Venni Amore," not "Vieni"; the arietta begins: "Venni Amore nel tuo regno, ma compagno del Timor." Righini gave his melody a number of vocal variations. Beethoven republished his in Vienna in 1801 through Traeg (Complete Works, Series 17, No. 178); composed about 1790 and published in Mannheim in 1791. They were inscribed to Countess Hatzfeld (_née_ Countess de Girodin), who has been praised in this book as an eminent pianist. The story of the encounter between Beethoven and Sterkel in which these variations figure has also been told. Beethoven had a good opinion of them; Czerny told Otto Jahn that he had brought them with him to Vienna and used them to "introduce" himself.

PIANOFORTE VARIATIONS AND A SONATA

Two books of variations are to be adjudged to the Bonn period because of their place of publication and other biographical considerations. They are the Variations in A major on a theme from Dittersdorf's opera "Das rothe Käppchen" ("Es war einmal ein alter Mann") and the Variations for four hands on a theme by Count Waldstein. Both sets were published by Simrock in Bonn, the first of Beethoven's compositions published in his native town. They were not published until 1794, but according to a letter to Simrock, dated August 2, 1794, the latter had received the first set a considerable time before, and Beethoven had held back the corrections while the other was already printed. Beethoven's intimate association with Waldstein in Bonn is a familiar story, but we hear nothing of it in the early Viennese days. The variations on a theme of his own seem likely to have been the product of a wish expressed by the Count. That Beethoven seldom wrote for four hands, and certainly not without a special reason, is an accepted fact.[60]

Another presumably Bonnian product which has come down to us only as a fragment is the Sonata in C major for Pianoforte, published in 1830 by Dunst in Frankfort, with a dedication to Eleonore von Breuning. It is probably the sonata which Beethoven, according to the letter to be given presently, had promised to his friend and which was fully sketched at the time. There would be no doubt of the fact that the sonata was written in Bonn if the presumption that the letter was written in Bonn were true; but even as it is, the fact that the letter says that it had been promised "long ago" indicates a pre-Viennese origin. All that is certain is that Eleonore von Breuning received it from Beethoven in 1796. In the copy sent to the publisher eleven measures at the end of the _Adagio_ were lacking. These were supplied by Ferdinand Ries in the manner of Beethoven. There can scarcely be a doubt that Beethoven finished the _Adagio_, and it can be assumed that he also composed a last movement, which has been lost.

Concerning the Rondo in C major published in Bossler's "Blumenlese" of 1783, we have already spoken.[61]

It is a striking fact to any one who has had occasion to examine carefully the chronology of publication of Beethoven's works, that up to nearly the close of 1802 whatever appeared under his name was worthy of that name; but that then, in the period of the second, third and fourth symphonies, of the sonatas. Op. 47, 53, 57 and of "Leonore," to the wonder of the critics of that time serial advertisements of the "Kunst- und Industrie-Comptoir" in Vienna announce the Trios, Op. 30 and the seven Bagatelles, Op. 33; in another the "Grand Sinfonie," Op. 36, and the Variations on "God save the King"; on May 15, 1805, the Waldstein Sonata and the Romance, Op. 50; and on June 16 the songs. Op. 52, which the "Allgemeine Mus. Zeitung" describes as "commonplace, poor, weak, in part ridiculous stuff." Ries solves the enigma when he writes ("Notizen," 124) that all trifles, many things which he never intended to publish because he deemed them unworthy of his name, were given to the world through the agency of his brother. In this manner the world was made acquainted with songs which he had written long before he went to Vienna from Bonn. Even little compositions which he had written in albums were filched and published.

But even if the widest latitude be given to the judgment in selecting from the publications of these years' works belonging to the Bonn period, still what an exceedingly meagre list is the aggregate of Beethoven's compositions from his twelfth to the end of his twenty-second year! Mozart's, according to Köchel, reach at that age 293; Handel completed his twentieth year, February 23, 1705; on the twenty-fifth his second opera "Nero" was performed. And what had he not previously written!

This apparent lack of productiveness on the part of Beethoven has been noticed by other writers. One has disputed the fact and is of opinion that the composer in later years destroyed the manuscripts of his youth to prevent the possibility of injury to his fame by their posthumous publication. But this explanation is nonsense, as every one knows who has had an opportunity to examine the autograph collections in Vienna and there to remark with what scrupulous care even his most valueless productions were preserved by their author in all his migrations from house to house and from city to country throughout his Vienna life.

Beethoven attached absolutely no value to his autographs; after they had once been engraved they generally were piled on the floor in his living room or an anteroom among other pieces of music. I often brought order into his music, but when Beethoven hunted for anything, everything was sent flying in disorder. At that time I might have carried away the autograph manuscripts of all the pieces which had been printed, or had I asked him for them he would unquestionably have given them to me without a thought.

These words of Ries are confirmed by the small number of autographs of printed works in the auction catalogue of Beethoven's posthumous papers--most of them having remained in the hands of the publishers or having been lost, destroyed or stolen.

WORKS TAKEN TO VIENNA FROM BONN

Another author has endeavored to supply the vacuum by deducing the chronology of Beethoven's works from their form, matter or general character as viewed by his eyes, referring all which seem to him below the standard of the composer at any particular period to an earlier one; and a very comical chronology he makes of it. His success certainly has not been such as to induce any attempt of the kind here; and yet that he is right in the general fact is the hypothesis which the following remarks are conceived to establish as truth. Schindler--who is often very positive on the ground that what he does not know cannot be true--in introducing his chronological table of Beethoven's works, published from 1796 to 1800, remarks: "It may be asserted with positiveness that none of the works catalogued below were composed before 1794"; upon which point the assertion is ventured that Schindler is thoroughly mistaken and that many of the works published by Beethoven during the first dozen years of his Vienna life were taken thither from Bonn. They doubtless were more or less altered, amended, improved, corrected, but nevertheless belong as compositions to those years when "Beethoven played pianoforte concertos, and Herr Neefe accompanied at Court in the theatre and in concerts." While the other young men were trying their strength upon works for the orchestra and stage, the performance of which would necessarily give them notoriety, the Court Pianist would naturally confine himself mostly to his own instrument and to chamber music--to works whose production before a small circle in the salons of the Elector, Countess Hatzfeld and others would excite little if any public notice. But here he struck out so new, and at that time so strange a path that no small degree of praise is due to the sagacity of Count Waldstein, who comprehended his aims, felt his greatness and encouraged him to trust to and be guided by his own instincts and genius.

That Beethoven also tried his powers in a wider field we know from the two cantatas, the airs in "Die schöne Schusterin" and the "Ritterballet." Carl Haslinger in Vienna also possessed an orchestral introduction to the second act of an unnamed opera which may as well be referred to the Bonn period as to any other; and it is not by any means a wild suggestion that he had tried his strength in other concertos for pianoforte and full orchestra than that of 1784. As to the compositions for two, six or eight wind-instruments there was little if any danger of mistake in supposing them to have been written for the Elector's "Harmonie-Musik." But this is wandering from the point; to establish which the following remarks are in all humility submitted:

CREATIVE INDUSTRY IN BONN

I. If a list be drawn up of Beethoven's compositions published between 1795 and December, 1802, with the addition of other works known to have been composed in those years, the result will be nearly as follows (omitting single songs and other minor pieces): symphonies, 2; ballet ("Prometheus"), 1; sonatas (solo and duo), 32; romances (violin and orchestra), 2; serenade, 1; duos (clarinet and bassoon), 3; sets of variations, 15; sets of dances, 5; "Ah! perfido" and "Adelaide," 2; pianoforte concertos, 3; trios (pianoforte and other instruments), 9; quartets, 6; quintets, 3; septet, 1; pianoforte rondos, 3; marches (for four hands), 3; oratorio ("Christus"), 1; an aggregate of 92 compositions in eight years or ninety-six months. And most of them such compositions! That Beethoven was a remarkable man all the world knows; but that he could produce at this rate, study operatic composition with Salieri, sustain, nay, increase his reputation as a pianoforte virtuoso, journey to Prague, Berlin and other places, correct proof-sheets for his publishers, give lessons and yet find time to write long letters to friends, to sleep, to eat, drink and be merry with companions of his own age--this is, to say the least, "a morsel difficult of digestion." The more so from the fact that at the very time when he began to devote himself more exclusively to composition such marvellous fertility suddenly ceased. The inference is obvious.

II. When Neefe, in 1798, calls Beethoven “beyond controversy one of the foremost pianoforte players,” it excites no surprise. Ten years before he had played the most of Bach’s “Well-Tempered Clavichord” and had now long held the offices of Second Court Organist and Concerto Player; but what sufficient reason could Waldstein have had for his faith that this pianist, by study and perseverance, would yet be able to seize and hold the sceptre of Mozart? And upon what grounds, too, could Fischenich, on January 26, 1793, write as he did to Charlotte von Schiller from Bonn (see _ante_) and add, “I expect something perfect from him, for so far as I know him he is wholly devoted to the great and sublime.... Haydn has written here that he would soon put him at grand operas and soon be obliged to quit composing.”

Note the date of this--January 26, 1793. Haydn must have written some time before this, when Beethoven could not have been with him more than six or eight weeks. Did the master found his remark upon what he had seen in his pupil or upon the compositions which his pupil had placed before him? Wegeler has printed an undated and incomplete letter of Beethoven to Eleonore von Breuning, certainly, however, not later than the spring of 1794, which was accompanied by a set of variations and a rondo for pianoforte and violin. Do the following passages in this letter indicate anything?

I have a great deal to do or I would before this have transcribed the sonata _which I promised you long ago_. It is a mere sketch in my manuscript and it would be a difficult task even for the clever and practised Paraquin to copy it. You can have the rondo copied and return the score to me. It is the only one of my things which is, in a manner, suitable to you.

May these words not be paraphrased thus: “As to the sonata which I played at your house and of which I promised you a copy--it is in my manuscript hardly more than a sketch, so that I could not trust it to a copyist, not even to Paraquin, and I have not had leisure to transcribe it myself.” And, finally, the closing lines of a short article in the “Jahrbuch der Tonkunst für Wien und Prag,” 1776--which notice was not written later than the spring of 1795, nine or ten months before the publication of the Sonatas Op. 2--are pregnantly suggestive: “We have a number of beautiful sonatas by him, amongst which the last ones particularly distinguish themselves.” These works were, therefore, well-known in manuscript even at the time when he was busy with his studies under Haydn and Albrechtsberger.

III. If in spite of the above it still be objected that the _opera_ 1 to 15, or 20, as you please, are of a character beyond the powers of Beethoven during his Bonn life, who _knows_ this to be a fact? Has such an objection any other basis than a mere prejudice?

EVIDENCES OF EARLY ACTIVITY

A fanciful theory has exhibited Beethoven to us as a rude, undeveloped genius, who, being transferred to Vienna and schooled two years by Haydn and Albrechtsberger, then began with the Trios Op. 1, wrought his way upward in eight years through the twenty-three compositions of _opera_ 2 to 14 in a geometrical progression to the first pianoforte concertos, the ballet “Prometheus” and the Symphony in C! It is, however, known that in March, 1795, Beethoven played his Pianoforte Concerto in B-flat in Vienna, shortly afterward published the Trios, Op. 1, and in 1796 composed the two sonatas for pianoforte and violoncello in Berlin. A young man who at the age of 24 or 25 could give the public two such concertos could hardly have been such a rough diamond only three or four years before.

IV. However convincing the preceding propositions may seem to the ordinary reader, the critical student of musical history justly demands something more. It is not enough for him to know that Op. 19 was composed before the publication of Op. 1; that Op. 2 is in part made up from the Pianoforte Quartets of 1785; that the Quintet Op. 4 is an arrangement of the “Parthia” in E-flat for wind-instruments afterwards published as Op. 103, and is now proved to belong to the Bonn period, and that a whole movement of the funeral cantata found its way into “Fidelio”--the argument is to him like an arch without its keystone until one or more of the important works be named specifically as Bonn compositions and proved to be such.[62]

FOOTNOTES:

[49] The discoveries made after Thayer completed and printed his first volume in German (1866), largely inspired by his labors, have made a thorough revision of this chapter imperative. In all that follows the editor has accepted the statement of facts made by Dr. Deiters in his revised version of the first volume published in 1901, but, in pursuance of his plan as set forth in the introduction, has omitted that which seemed to him more or less inconsequential, as well as that which belongs in the field of analysis and criticism.

[50] There have been a few performances of this cantata in Austria and Germany since its publication. It was given at a concert of the Beethoven Association in New York on March 16, 1920, under the direction of Mr. Sam Franko, with an English paraphrase of

the text by the Editor of this biography, designed to rid it of its local application and some of its bombast and make its sentiment applicable to any heroic emancipator.

[51] See Vol. II, p. 210, of the first German edition of this work. Ries says, on page 124 of the “Notizen,” apropos of the posthumous manuscripts: “All such trifles and things which he never meant to publish, as not considering them worthy of his name, were secretly brought into the world by his brothers. Such were the songs published when he had attained the highest degree of fame, composed years before at Bonn, previous to his departure for Vienna; and in like manner other trifles, written for albums, etc., were secretly taken from him and published.”

[52] The subject of the German Song was used by Beethoven later in a sonata.

[53] The Trio in E-flat was not published until 1797. It is therefore obvious that the music which Abbé Dobbeler carried with him to England must have been a manuscript copy. Dr. Deiters, accepting without attempt at contradiction Thayer’s proof of its origin at a period not later than 1792, nevertheless puts forth the conjecture that the work may have been revised and reconstructed at a later date in Vienna, as was the case with other compositions. It is not to be supposed, he urges, that Beethoven, enjoying the celebrity that he did in 1797, would have published then with an opus number a production of his youth without first subjecting it to a thorough revision. Moreover, his earlier chamber compositions were in three movements, the minuet having been added for the first time in the Octet. It was scarcely conceivable that he should have simultaneously conceived a work in six movements unless he had had a Mozart model in his mind. But why not? We have seen from the story of the music admired at the court of Vienna from which the Elector came that the serenade form was in favor there. The Sonata for Pianoforte and Violoncello which Artaria announced in May, 1807, is an arrangement of this Trio, but it was not made by Beethoven.

[54] Josef Hellmesberger, of Vienna, completed the movement, utilizing the existing _motivi_, and the piece was published by Friedrich Schreiber.

[55] Dr. Deiters points out as characteristics of this Trio which indicate that it was not written by Beethoven at the age of 15, but long after the pianoforte quartets, the freedom in invention and development, the large dimensions of the free fantasia portion, its almost imperceptible return to the principal theme, and the introduction of a coda in the first movement. _Motivi_ from this movement recur in later works, for instance, the Sonata in F minor, Op. 2, and the Pianoforte Concerto in C major. Beethoven seems to have used the designation “Scherzo” in it for the first time.

[56] The combination of instruments in this piece led Dr. Deiters to conjecture that it may have been composed for the family von Westerhold. Count von Westerhold played the bassoon, his son the flute, and his daughter the pianoforte.

[57] Dr. Deiters points out that Thayer, in transcribing the themes of this Trio, overlooked a _Largo_, which made the movements number four instead of three as given in the Chronological Catalogue. The existence of four movements added to the doubtful authenticity in the eyes of the German editor.

[58] This letter will appear later. The Variations are published in Series 12, No. 103, of the Complete Edition. In a catalogue of Breitkopf and Härtel of 1793, they are designated Op. 1; also in a catalogue in 1794 of Geyl and Hedler’s. It is plain from a passage in the letter to Eleonore von Breuning (“I never would have written it in this way,” etc.) that the Coda did not receive its definitive form until just before publication. Thayer was of the opinion when he wrote Vol. I of this work, that it had been appended in Vienna.

[59] It was published in 1805 by the Kunst- und Industriecomptoir of Vienna. Complete Works, Series 18, No. 195; _cf._ Nottebohm’s “Beethoven’s Studien,” p. 6.

[60] In the Fall of 1919, announcement was made by the newspapers that French investigators had discovered in the British Museum four thitherto unknown Beethoven autographs amongst manuscripts purchased by Julian Marshall. The editor of the second edition of Köchel’s “Thematic Catalogue of Mozart’s Works” had seen the manuscripts and included two of them as authentic Mozart compositions and two as probably such in the supplement to that work. They were a Trio in D, for pianoforte, violin and violoncello (two pages of the first _Allegro_ missing, listed as K, No. 52a); three pieces for pianoforte, four hands, a _Gavotte_ in F, an _Allegro_ in B-flat, and a _Marcia lugubre_ in C minor (six measures), No. 71a; a _Rondo_ in B-flat, to which the editor assigned the year 1786, No. 511a; and a _Menuet_ in C, for orchestra, the first of a set composed by Beethoven in 1795, which M. Chantavoine published in 1903 under the title “Douze Menuets inédits pour Orchestre. L. van Beethoven. Œuvres posthumes. Au Ménestrel.” Theodore Wyzewa and Georges de St. Foix made a study of the manuscripts and discussed them in “Le Guide Musical” of December, 1919, January and February, 1920. They were then set down as “pseudo-Mozarts.” M. Charles Malherbe

declared that none of the compositions was in Mozart's hand, and M. de St. Foix, after further consideration of the internal evidence, declared them all to be indubitably by Beethoven and gave his reasons in an essay published in "The Musical Quarterly" (New York and Boston, G. Schirmer) of April, 1920. He told the history of the manuscripts as follows: "They had been presented by the Emperor of Austria to the Sultan Abdul Aziz. The latter, who probably cared very little for these relics of the 18th century, presented them in turn to his musical director, Guatelli Pasha. An English collector, Julian Marshall, purchased them from the Pasha's son, W. Guatelli Bey, and when, later on, the British Museum acquired the Marshall Collection these manuscripts went over into its possession."

The _Gavotte_ was played at a concert of the Beethoven Association in New York in January, 1920, by Madame Samaroff and Harold Bauer, being inserted as a movement in the Sonata in A major for four hands, Op. 6. Mr. Bauer also made an arrangement for two hands which has been published by G. Schirmer.

[61] The discoveries which have been made since Thayer wrote his first volume have very effectually disproved the old belief touching the sterility of the Bonn period. The inquiry which might still be pursued now is whether or not other compositions which have been attributed to a later period may not also have been composed, or at least projected and sketched, in Bonn. The point of view has changed, but what Thayer wrote over half a century ago is still so largely pertinent that it is here given in the body of the text with only such modifications as were necessary to bring it into harmony with the rest of the chapter.

[62] Thayer proceeds from this point to give the reasons for his belief that the Trios Op. 1 and 3 were written in Bonn. The origin of Op. 1 will be discussed hereafter; that of the latter has just been made clear by the story of Mrs. Bowater and Abbé Dobbeler.

Chapter XI

Beethoven in Vienna--Personal Details--Death of His Father--Minor Expenditures and Receipts--Studies with Albrechtsberger and Salieri.

BEETHOVEN SETTLES DOWN IN VIENNA

It would be pleasant to announce the arrival of Ludwig van Beethoven in Vienna with, so to speak, a grand flourish of trumpets, and to indulge the fancy in a highly-colored and poetic account of his advent there; but, unluckily, there is none of that lack of data which is favorable to that kind of composition; none of that obscurity which exalts one to write history as he would have it and not as it really was. The facts are too patent. Like the multitude of studious youths and young men who came thither annually to find schools and teachers, this small, thin, dark-complexioned, pockmarked, dark-eyed, bewigged young musician of 22 years had quietly journeyed to the capital to pursue the study of his art with a small, thin, dark-complexioned, pockmarked, black-eyed and bewigged veteran composer. In the well-known anecdote related by Carpani of Haydn's introduction to him, Anton Esterhazy, the prince, is made to call the composer "a Moor." Beethoven had even more of the Moor in his looks than his master. His front teeth, owing to the singular flatness of the roof of his mouth, protruded, and, of course, thrust out his lips; the nose, too, was rather broad and decidedly flattened, while the forehead was remarkably full and round--in the words of the late Court Secretary, Mähler, who twice painted his portrait, a "bullet."

"Beethoven," wrote Junker, "confessed that in his journeys he had seldom found in the playing of the most distinguished virtuosos that excellence which he supposed he had a right to expect." He now had an opportunity to make his observations upon the pianists and composers at the very headquarters, then, of German music, to improve himself by study under the best of them and, by and by, to measure his strength with theirs. He found very soon that the words of the poet were here also applicable:

"'Tis distance lends enchantment to the view," and did not find--now Mozart was gone--"what he supposed he had a right to expect." For the present, however, we have to do but with the young stranger in a large city, seeking lodgings, and making such arrangements for the future as shall not be out of due proportion to the limited pecuniary means at his command. If the minute details which here follow should seem to be too insignificant in themselves, the bearing they have upon some other future questions must justify their introduction.

Turning again to the memorandum book, the first entries which follow the notes of the journey from Bonn to Würges are merely of necessities to be supplied--"wood, wig-maker, coffee, overcoat, boots, shoes, pianoforte-desk, seal, writing-desk, pianoforte-money" and something illegible followed by the remark: "All beginning with next month." The next page gives a hint as to the day of his arrival. It contains the substance of two advertisements in the "Wiener Zeitung" of pianofortes for sale, one near the

Hohen Markt and two “im Kramerschen Breihaus No. 257 im Schlossergassel, am Graben.” The latter appears _for the last time_ on the 10th of November; Beethoven was, therefore, then in Vienna.

But he intends to cultivate the Graces as well as the Muses. The next page begins with this: “Andreas Lindner, dancing-master, lives in the Stoss am Himmel, No. 415,” to which succeeds a note, evidently of money received from the Elector, possibly in Bonn but more likely in Vienna: “25 ducats received of which, expended on November (?) half a sovereign for the pianoforte, or 6 florins, 40 kreutzer--2 florins were of my own money.” The same page also shows him in the matter of his toilet preparing even then for entrance into society: “Black silk stockings, 1 ducat; 1 pair of winter silk stockings, 1 florin, 40 kreutzers; boots, 6 florins; shoes, 1 florin, 30 kreutzers.” But these expenses in addition to his daily necessities are making a large inroad upon his “25 ducats received”; and on page 7 we read: “On Wednesday the 12th of December, I had 15 ducats.” (The 12th of December fell upon Wednesday in the year 1792.) Omitting for the present what else stands upon page 7, here are the interesting contents of page 8--and how suggestive and pregnant they are: “In Bonn I counted on receiving 100 ducats here; but in vain. I have got to equip myself completely anew.”

Several pages which follow contain what, upon inspection, proves evidently to be his monthly payments from the time when “all was to begin next month,” of which the first may be given as a specimen: “House-rent, 14 florins; pianoforte, 6 florins, 49 kreutzers; eating, each time 12 kreutzers; meals with wine 6 and one-half florins; 3 kreutzers for B. and H.; it is not necessary to give the housekeeper more than 7 florins, the rooms are so close to the ground.”[63]

DEATH OF JOHANN VAN BEETHOVEN

Beethoven was hardly well settled in his lodgings, the novelty of his position had scarcely begun to wear off under the effect of habit, when startling tidings reached him from Bonn of an event to cloud his Christmas holidays, to weaken his ties to his native place, to increase his cares for his brothers and make an important change in his pecuniary condition. His father had suddenly died--“1792, Dec. 18, _obiit_ Johannes Beethoff,” says the death-roll of St. Remigius parish. The Elector-Archbishop, still in Münster, heard this news also and consecrated a joke to the dead man’s memory. On the 1st of January, 1793, he wrote a letter to Court Marshal von Schall in which these words occur:

The revenues from the liquor excise have suffered a loss in the deaths of Beethoven and Eichhoff. For the widow of the latter, provision will be made if circumstances allow in view of his 40 years of service--in the electoral kitchen.

Franz Ries was again to befriend Beethoven and act for him in his absence, and the receipt for his first quarter’s salary (25 th.) is signed “F. Ries, in the name of Ludwig Beethoven,” at the usual time, namely the beginning of the second month of the quarter, February 4. But the lapse of Johann van Beethoven’s pension of 200 thalers, was a serious misfortune to his son, particularly since the 100 ducats were not forthcoming. The correspondence between Beethoven and Ries not being preserved it can only be conjectured that the latter took the proper steps to obtain that portion of the pension set apart by the electoral decree for the support of the two younger sons; but in vain, owing to the disappearance of the original document; and that, receiving information of this fact, Beethoven immediately sent from Vienna the petition which follows, but which, as is mostly the case with that class of papers in the Bonn archives, is without date:

Several years ago Your Serene Electoral Highness was graciously pleased to retire my father, the tenor singer van Beethoven, from service, and to set aside 100 thalers of his salary to me that I might clothe, nourish and educate my two younger brothers and also pay the debts of my father.

I was about to present this decree to Your Highness’s Revenue Exchequer when my father urgently begged me not to do so inasmuch as it would have the appearance in the eyes of the public as if he were incapable of caring for his family, adding that he would himself pay me the 25 thalers quarterly, which he always did.

When, however, on the death of my father (in December of last year) I wished to make use of Your Highness’s grace by presenting the above-mentioned gracious decree I learned to my terror, that my father had misapplied (_unterschlagen_ = to embezzle) the same.

In most obedient veneration I therefore pray Your Electoral Highness for the gracious renewal of this decree and that Your Highness’s Revenue Exchequer be directed to pay over to me the sum graciously allowed to me due for the last quarter at the beginning of last February.

Your Electoral and Serene Highness's Most obedient and faithful Lud. v. Beethoven; Court Organist.

The petition was duly considered by the Privy Council and with the result indicated by the endorsement:

ad sup. of the Court Organist L. van Beethoven

... "The 100 reichsthaler which he is now receiving annually is increased by a further 100 reichsthaler in quarterly payments beginning with January 1st, from the 200 rth. salary vacated by the death of his father; he is further to receive the three measures of grain graciously bestowed upon him for the education of his brothers." The Electoral Court Chancellory will make the necessary provisions. Attest p.

The order to the exchequer followed on May 24th, and on June 15th, Franz Ries had the satisfaction of signing receipts--one for 25 thalers for January, February and March, and one for 50 thalers for the second quarter of the year; but from this time onward no hint has yet been discovered that Beethoven ever received anything from the Elector or had any resources but his own earnings and the generosity of newly-found friends in Vienna. These resources were soon needed. The remark that two florins of the payment towards the pianoforte were out of his own money proves that he possessed a small sum saved up by degrees from lesson-giving, from presents received and the like; but it could not have been a large amount, while the 25 ducats and the above recorded receipts of salary were all too small to have carried him through the summer of 1793. Here is the second of his monthly records of necessary and regular expenses in farther proof of this: "14 florins house-rent; 6 fl. 40 x, pianoforte; meals with wine, 15 fl. and a half;--(?), 3 florins; maid, 1," the sum total being as added by himself "11 ducats and one-half florin." And yet at the end of the year there are entries that show that he was not distressed for money. For instance: "the 24th October, i.e., reckoning from November 1st, 112 florins and 30 kreutzer"; "2 ducats for a seal; 1 florin, 25 kreutzers, copyist"; "Tuesday and Saturday from 7 to 8. Sunday from 11 to 12, 3 florins"; and the final entry not later in date than 1794 is: "3 carolins in gold, 4 carolins in crown thalers and 4 ducats make 7 carolins and 4 ducats and a lot of small change."

In what manner Beethoven was already in 1794 able to remain "in Vienna without salary until recalled," to quote the Elector's words, will hereafter appear with some degree of certainty; but just now he claims attention as pupil of Haydn and Albrechtsberger. The citations made in a previous chapter from the letters of Neefe and Fischenich prove how strong an impression Beethoven's powers, both as virtuoso and composer, had made upon Joseph Haydn immediately after his reaching Vienna; and no man then living was better able to judge on such points. But whether the famous chapelmaster, just returned from his English triumphs, himself a daring and successful innovator and now very busy with compositions in preparation for his second visit to London, was the man to guide the studies of a headstrong, self-willed and still more daring musical revolutionist was, _a priori_, a very doubtful question. The result proved that he was not.

BEETHOVEN'S STUDIES WITH HAYDN

The memorandum book has a few entries which relate to Haydn. On page 7, that which contains the 15 ducats on the 12th of October, 1792, there is a column of numerals, the first of which reads, "Haidn 8 groschen"; the other twelve, except a single "1," all "2"; and on the two pages which happen to have the dates of October 24 and 29, 1793, are these two entries: "22 x, chocolate for Haidn and me"; "Coffee, 6 x for Haidn and me." These notes simply confirm what was known from other sources, namely, that Beethoven began to study with Haydn very soon after reaching Vienna and continued to be his pupil until the end of the year 1793.[64] They indicate, also, that the scholar, whatever feelings he may have indulged towards the master in secret, kept on good terms with him, and that their private intercourse was not confined to the hours devoted to lessons in Haydn's room in the Hamberger house, No. 992 on the (no longer existing) Wasserkunstbastei.

Concerning the course of study during that year, nothing can be added to the words of Nottebohm ("Allg. Mus. Zeitung," 1863-1864), founded upon a most thorough examination of all the known manuscripts and authorities which bear upon this question. Of the manuscripts Nottebohm says: "They are exercises in simple counterpoint on six plain chants in the old modes.... He must have written more." But what? On this point there are no indications to be found. It may be accepted with considerable certainty that the contrapuntal exercises were preceded by an introductory, though probably brief, study of the nature of consonances and dissonances. For this the last chapter of the first book of Fux's "Gradus ad Parnassum" might have served.

But this (adds Nottebohm) would not have sufficed to fill the entire period. In view of Haydn's predilection for Fux's system it is not conceivable that there were preliminary exercises, say in the free style or in the modern keys; there remains, therefore, no alternative but to go back further and opine that the study with Haydn began with the theory of harmony and exercises in which the

system of Philipp Emanuel Bach might have been used.

“It is certain,” says Schindler, “that Beethoven’s knowledge of the science of harmony at the time when he began his study with Haydn did not go beyond thoroughbass.” The correctness of this opinion of Schindler may be safely left to the judgment of the reader. The fact seems to be that Beethoven, conscious of the disadvantages attending the want of thorough systematic instruction, distrustful of himself and desirous of bringing to the test many of his novel and cherished ideas, had determined to accomplish a complete course of contrapuntal study, and thus renew, revise and reduce to order and system the great mass of his previous scientific acquirements. He would, at all events, thoroughly know and understand the _regular_ that he might with confidence judge for himself how far to indulge in the _irregular_. To this view, long since adopted, the results of Nottebohm’s researches add credibility. It explains, also, how a young man, too confident in the soundness of his views to be willing to alter his productions because they contained passages and effects censured by those about him for being other than those of Mozart and Haydn, was yet willing, with the modesty of true genius, to shut them up in his writing-desk until, through study and observation, he could feel himself standing upon the firm basis of sound knowledge and then retain or exclude, according to the dictates of an enlightened judgment.

Beethoven, however, very soon discovered that also in Haydn, as a teacher, he had “not found that excellence which he supposed he had a right to expect.” Ries remembered a remark made by him on this point: “Haydn had wished that Beethoven might put the word, ‘Pupil of Haydn,’ on the title of his first works. Beethoven was unwilling to do so because, as he said, though he had had some instruction from Haydn he had never learned anything from him.” Still more in point is the oft-repeated story of Johann Schenk’s kindness to Beethoven, related by Seyfried in Gräfer’s and Schilling’s lexica and confirmed by Schindler, which, when divested of its errors in dates, may be related thus: Among Beethoven’s earliest acquaintances in Vienna was the Abbé Joseph Gelinek, one of the first virtuosos then in that city and an amazingly fruitful and popular composer of variations. It was upon him that Carl Maria von Weber, some years afterwards, wrote the epigram:

Kein Thema auf der Welt verschonte dein Genie, Das simpelste allein--Dich selbst--variirst du nie!

“No theme on earth escaped your genius airy,-- The simplest one of all--yourself--you never vary.”

Czerny told Otto Jahn that his father once met Gelinek tricked out in all his finery. “Whither?” he inquired. “I am asked to measure myself with a young pianist who is just arrived; I’ll use him up.” A few days later he met him again. “Well, how was it?” “Ah, he is no man; he’s a devil. He will play me and all of us to death. And how he improvises!” According to Czerny, Gelinek remained a sworn enemy to Beethoven.

It was in Gelinek’s lodgings that Schenk heard Beethoven improvise for the first time,

a treat which recalled lively recollections of Mozart. With many manifestations of displeasure, Beethoven, always eager to learn, complained to Gelinek that he was never able to make any progress in his contrapuntal studies under Haydn, since the master, too variously occupied, was unable to pay the amount of attention which he wanted to the exercises he had given him to work out. Gelinek spoke on the subject with Schenk and asked him if he did not feel disposed to give Beethoven a course in composition. Schenk declared himself willing, with ready courtesy, but only under two conditions: that it should be without compensation of any kind and under the strict seal of secrecy. The mutual agreement was made and kept with conscientious fidelity.

Thus far Seyfried; we shall now permit Schenk to tell his own story:[65]

In 1792, His Royal Highness Archduke Maximilian, Elector of Cologne, was pleased to send his charge Louis van Beethoven to Vienna to study musical composition with Haydn. Towards the end of July, Abbé Gelinek informed me that he had made the acquaintance of a young man who displayed extraordinary virtuosity on the pianoforte, such, indeed, as he had not observed since Mozart. In passing he said that Beethoven had been studying counterpoint with Haydn for more than six months and was still at work on the first exercise; also that His Excellency Baron van Swieten had earnestly recommended the study of counterpoint and frequently inquired of him how far he had advanced in his studies. As a result of these frequent incitations and the fact that he was still in the first stages of his instruction, Beethoven, eager to learn, became discontented and often gave expression to his dissatisfaction to his friend. Gelinek took the matter much to heart and came to me with the question whether I felt disposed to assist his friend in the study of counterpoint. I now desired to become better acquainted with Beethoven as soon as possible, and a day was fixed for me to meet him in Gelinek’s lodgings and hear him play on the pianoforte.

BEETHOVEN’S IMPROVISATIONS

Thus I saw the composer, now so famous, for the first time and heard him play. After the customary courtesies he offered to improvise on the pianoforte. He asked me to sit beside him. Having struck a few chords and tossed off a few figures as if they were of no significance, the creative genius gradually unveiled his profound psychological pictures. My ear was continually charmed by the beauty of the many and varied motives which he wove with wonderful clarity and loveliness into each other, and I surrendered my heart to the impressions made upon it while he gave himself wholly up to his creative imagination, and anon, leaving the field of mere tonal charm, boldly stormed the most distant keys in order to give expression to violent passions....

The first thing that I did the next day was to visit the still unknown artist who had so brilliantly disclosed his mastership. On his writing desk I found a few passages from his first lesson in counterpoint. A cursory glance disclosed the fact that, brief as it was, there were mistakes in every key. Gelinek's utterances were thus verified. Feeling sure that my pupil was unfamiliar with the preliminary rules of counterpoint, I gave him the familiar textbook of Joseph Fux, "Gradus ad Parnassum," and asked him to look at the exercises that followed. Joseph Haydn, who had returned to Vienna towards the end of the preceding year,[66] was intent on utilizing his muse in the composition of large masterworks, and thus laudably occupied could not well devote himself to the rules of grammar. I was now eagerly desirous to become the helper of the zealous student. But before beginning the instruction I made him understand that our coöperation would have to be kept secret. In view of this I recommended that he copy every exercise which I corrected in order that Haydn should not recognize the handwriting of a stranger when the exercise was submitted to him. After a year, Beethoven and Gelinek had a falling out for a reason that has escaped me; both, it seemed to me, were at fault. As a result Gelinek got angry and betrayed my secret. Beethoven and his brothers made no secret of it longer.

I began my honorable office with my good Louis in the beginning of August, 1792,[67] and filled it uninterruptedly until May, 1793,[67] by which time he finished double counterpoint in the octave and went to Eisenstadt. If His Royal Highness had sent his charge at once to Albrechtsberger his studies would never have been interrupted and he would have completed them.

Here follows a passage, afterward stricken out by Schenk, in which he resents the statement that Beethoven had finished his studies with Albrechtsberger. This would have been advisable, but if it were true, Gelinek as well as Beethoven would have told him of the fact. "On the contrary, he admitted to me that he had gone to Herr Salieri, Royal Imperial Chapelmaster, for lessons in the free style of composition." Then Schenk continues:

About the middle of May he told me that he would soon go with Haydn to Eisenstadt and stay there till the beginning of winter; he did not yet know the date of his departure. I went to him at the usual hour in the beginning of June but my good Louis was no longer to be seen. He left for me the following little billet which I copy word for word:

"Dear Schenk!

It was not my desire to set off to-day for Eisenstadt. I should like to have spoken with you again. Meanwhile rest assured of my gratitude for the favors shown me. I shall endeavor with all my might to requite them. I hope soon to see you again, and once more to enjoy the pleasure of your society. Farewell and

do not entirely forget your Beethoven."

It was my intention only briefly to touch upon my relations with Beethoven; but the circumstances under which, and the manner in which I became his guide in musical composition constrained me to be somewhat more explicit. For my efforts (if they can be called efforts) I was rewarded by my good Louis with a precious gift, viz.: a firm bond of friendship which lasted without fading till the day of his death.

Written in the summer of 1830.

A chronological difficulty is presented by Schenk's story of the cessation of the instruction. There can be no doubt that it began towards the beginning of August, 1793, as confirmed by the distinct utterance of Schenk (who errs in the year, however), particularly by the statement that the study with Haydn had already endured six months. Schenk's instruction is said to have lasted till the end of May, 1794, and the definitive mention of the month makes an error improbable. But at this time Haydn was already long in England, while Schenk's narrative represents Beethoven as saying that he intended going to Eisenstadt with Haydn; moreover, Beethoven was already Albrechtsberger's pupil and as such was no longer in need of secret help. Nevertheless, the continuance of the relations with Schenk is easily possible and they were not likely to be interrupted so long as Beethoven remained in Vienna; this is indicated by the reference to double counterpoint, which Beethoven did not study under Haydn but with Albrechtsberger; also Schenk's intimation that if the Elector had sent his charge "at once" to Albrechtsberger shows that instruction

with the latter had already begun. The letter to Schenk, though cast in friendly terms, can nevertheless be interpreted as a declination of further services, a breaking off of the relationship between teacher and pupil, for which the journey to Eisenstadt was a welcome excuse. But we learn only from Schenk that Beethoven was to make the journey with Haydn, and he may have been mistaken in this as he was in the year. It is very conceivable that Beethoven had received an invitation to visit him from Prince Esterhazy, who must surely have got acquainted with him in Vienna. He who is unwilling to accept this, must place the letter and the journey in the last months of 1793, which is in every respect improbable.

BEETHOVEN'S RELATIONS WITH HAYDN

The relations between Haydn and his pupil did not long continue truly cordial; yet Beethoven concealed his dissatisfaction and no break occurred. Thoughtless and reckless of consequences, as he often in later years unfortunately exhibited himself when indulging his wilfulness, he was at this time responsible to the Elector for his conduct, and Haydn, moreover, was too valuable and influential a friend to be wantonly alienated. So, whatever feelings he cherished in secret, he kept them to himself, went regularly to his lessons and, as noted above, occasionally treated his master to chocolate or coffee. It was, of course, Haydn who took the young man to Eisenstadt, and, as Neefe tells us, he wished to take him to England. Why was that plan not carried out? Did Maximilian forbid it? Would Beethoven's pride not allow him to go thither as Haydn's pupil? Did zeal for his contrapuntal studies prevent it? Or had his relations to the Austrian nobility already become such as offered him higher hopes of success in Vienna than Haydn could propose in London? Or, finally, was it his ambition rather to make himself known as Beethoven the composer than as Beethoven the pianoforte virtuoso? Pecuniary reasons are insufficient to account for the failure of the plan; for Haydn, who now knew the London public, could easily have removed all difficulty on that score. Neefe's letter was written near the end of September, 1793, when already "a number of reports" had reached Bonn "that Beethoven had made great progress in his art." These "reports," we know from Fischenich, came in part from Haydn himself. Add to that the wish to take his pupil with him to England--which was certainly the highest compliment he could possibly have paid him--and the utter groundlessness of Beethoven's suspicions that Haydn "was not well-minded towards him," as Ries says in his "Notizen" (page 85), is apparent. Yet these suspicions, added to the reasons above suggested, sufficiently explain the departure of the master for London without the company of his pupil, who now (January, 1794) was transferred to Albrechtsberger.

In the pretty extensive notes copied from the memorandum book already so much cited, there are but two which can with any degree of certainty be referred to a date later than 1793. One of them is this:

Schuppanzigh, 3 times a W. (Week?) Albrechtsberger, 3 times a W. (Week?)

The necessary inference from this is that Beethoven began the year 1794 with three lessons a week in violin-playing from Schuppanzigh (unless the youth of the latter should forbid such an inference) and three in counterpoint from the most famous teacher of that science. Seyfried affirms that the studies with the latter continued "two complete years with tireless persistency." The coming narrative will show that other things took up much of Beethoven's attention in 1795, and that before the close of that year, if not already at its beginning, his course with Albrechtsberger ended.[68]

STUDIES WITH ALBRECHTSBERGER

The instruction which Beethoven received from Albrechtsberger (and which was based chiefly on the master's "Anweisung zur Komposition") began again with simple counterpoint, in which Beethoven now received more detailed directions than had been given by Haydn. Albrechtsberger wrote down rules for him, Beethoven did the same and worked out a large number of exercises on two plain-song melodies which Albrechtsberger then corrected according to the rules of strict writing. There followed contrapuntal exercises in free writing, in imitation, in two-, three- and four-part fugue, choral fugue, double counterpoint in the different intervals, double fugue, triple counterpoint and canon. The last was short, as here the instruction ceased. Beethoven worked frequently in the immediate presence and with the direct coöperation of Albrechtsberger. The latter labored with obvious conscientiousness and care, and was ever ready to aid his pupil. If he appears at times to have been given over to minute detail and conventional method, it must be borne in mind that rigid schooling in fixed rules is essential to the development of an independent artist, even if he makes no use of them, and that it is only in this manner that freedom in workmanship can be achieved. Of this the youthful Beethoven was aware and every line of his exercises bears witness that he entered into his studies with complete interest and undivided zeal.[69] This was particularly the case in his exercises in counterpoint and imitation, where he strove to avoid errors, and their beneficial results are plainly noticeable in his compositions. Several of the compositions written after the lessons, disclose how "he was led from a predominantly figurative to a more contrapuntal manner of writing." There is less of this observable in the case of fugue, in

which the instruction itself was not free from deficiencies; and the pupil worked more carelessly. The restrictive rules occasionally put him out of conceit with his work; “he was at the age in which, as a rule, suggestion and incitation are preferred to instruction,” and his stubborn nature played an important rôle in the premises. However, it ought to be added that he was also at an age when his genial aptness in invention and construction had already found exercise in other directions. Even though he did not receive thorough education in fugue from Albrechtsberger, he nevertheless learned the constituent elements of the form and how to apply them. Moreover, in his later years he made all these things the subjects of earnest and devoted study independent of others; and in the compositions of his later years he returned with special and manifest predilection to the fugued style. Nothing could be more incorrect than to emphasize Beethoven’s lack of theoretical education. If, while studying with Albrechtsberger, but more particularly in his independent compositions, Beethoven ignored many of the strict rules, it was not because he was not able to apply them, but because he purposely set them aside. Places can be found in his exercises in which the rules are violated; but the testimony of the ear acquits the pupil. Rules are not the objects of themselves, they do not exist for their own sake, and in despite of all artistic systems; it is the reserved privilege of the evolution of art-means and prescient, forward genius to point out what in them is of permanent value, and what must be looked upon as antiquated. Nature designed that Beethoven should employ music in the depiction of soul-states, to emancipate melody and express his impulses in the free forms developed by Ph. Em. Bach, Mozart, Haydn and their contemporaries. In this direction he had already disclosed himself as a doughty warrior before the instruction in Vienna had its beginning, and it is very explicable that to be hemmed in by rigid rules was frequently disagreeable to him. He gradually wearied of “creating musical skeletons.” But all the more worthy of recognition, yea, of admiration, is the fact that the young composer who had already mounted so high, should by abnegation of his creative powers surrender himself to the tyranny of the rules and find satisfaction in conscientious practice of them.

Nottebohm summed up his conclusions from the investigations which he made of Beethoven’s posthumous papers thus: prefacing that, after 1785, Beethoven more and more made the manner of Mozart his own, he continues:

WHAT BEETHOVEN LEARNED

The instruction which he received from Haydn and Albrechtsberger enriched him with new forms and media of expression and these effected a change in his mode of writing. The voices acquired greater melodic flow and independence. A certain opacity took the place of the former transparency in the musical fabric. Out of a homophonic polyphony of two or more voices, there grew a polyphony that was real. The earlier obbligato accompaniment gave way to an obbligato style of writing which rested to a greater extent on counterpoint. Beethoven has accepted the principle of polyphony; his part-writing has become purer and it is noteworthy that the compositions written immediately after the lessons are among the purest that Beethoven ever composed. True, the Mozart model still shines through the fabric, but we seek it less in the art of figuration than in the form and other things which are only indirectly associated with the obbligato style. Similarly, we can speak of other influences--that of Joseph Haydn, for instance. This influence is not contrapuntal. Beethoven built upon his acquired and inherited possessions. He assimilated the traditional forms and means of expression, gradually eliminated foreign influences and, following the pressure of his subjective nature with its inclination towards the ideal, he created his own individual style.

As is known, Seyfried in his book entitled “Ludwig van Beethoven’s Studien im Generalbasse,” which appeared in 1832, gathered together all that was to be found in the way of exercises, excerpts from textbooks, etc., in Beethoven’s posthumous papers and presented them in so confused and arbitrary a manner that only the keenness and patience of a Nottebohm could point the way through the maze; Seyfried would have us believe that the entire contents of his book belonged to the studies under Albrechtsberger.

It will require no waste of words, says Nottebohm (p. 198), to prove the incompatibility of such a claim with the results of our investigations. As a matter of fact, only the smallest portion of the “Studies” can be traced back to the instruction which Beethoven received from Albrechtsberger. The greater part had nothing to do with this instruction and, aside from the changes made, belongs to the other labors. In the smaller portion Seyfried made things as easy for himself as possible. Of Beethoven’s exercises he took only such as he found cleanly copied or legibly written, and omitted those which were difficult to decipher because of many corrections. This is the explanation of the fact that Seyfried did not include a single exercise in strict simple counterpoint. If all the passages bearing on the course followed under Albrechtsberger were brought together and all the errors made in the presentation overlooked, we should still have but a fragmentary and faulty reflection of that study. Neither need we enter upon a discussion of the marginal notes attributed to Beethoven which so plentifully besprinkle Seyfried’s book. The fact is that in all the manuscripts which belong to the studies under Albrechtsberger not one of the “sarcastically thrown out” marginal notes is to be found. The glosses which do appear as Beethoven’s ... are of a wholly different character from those printed by Seyfried. They show that

Beethoven was deeply immersed and interested in the matter. It would, indeed, be inexplicable what could have persuaded Beethoven to continue study with a teacher with whom, as Seyfried would have us believe, he was in conflict already at the beginning of simple counterpoint. He had it in his power to discontinue his studies at any moment.

A doubt has been hinted above whether Beethoven's studies under Albrechtsberger were continued beyond the beginning of the year 1795. If all these exercises in counterpoint, fugue and canon, and all those excerpts from Fux, C. P. E. Bach, Türk, Albrechtsberger, and Kirnberger, which Seyfried made the basis of his "Studien"--and mingled in a confusion inextricable by any one possessing less learning, patience, sagacity and perseverance than Nottebohm--had already belonged to the period of his pupilage, their quantity alone, taken in connection with the writer's other occupations, would indeed preclude such a doubt; but knowing that perhaps the greater portion of those manuscripts belongs to a period many years later, and considering the great facility in writing which Beethoven had already acquired before coming to Vienna, there seems to be no indication of any course of study which might not easily be completed during the one year with Haydn (and Schenk) and one year with Albrechtsberger. Schönfeld, in the "Jahrbuch der Tonkunst für Wien und Prag," supposes that Beethoven was still the pupil of the latter at the time when he wrote, which was in the spring of 1795. His words are: "An eloquent proof of his [Beethoven's] real love of art is the circumstance that he has placed himself in the hands of our immortal Haydn, in order to be initiated into the sacred mysteries of composition. This great master has, in his absence, turned him over to our great Albrechtsberger." There is nothing decisive in this; and yet it is all that appears to confirm the "two years" of Seyfried; while on the other hand Wegeler, who, during all the year 1795, was much with Beethoven, has nowhere in his "Notizen" any allusion whatever to his friend as being still a student under a master.

Referring to the number of pages (160) of exercises and the three lessons a week, Nottebohm calculates the period of instruction to have been about fifteen months. Inasmuch as among the exercises in double counterpoint in the tenth there is found a sketch belonging to the second movement of the Trio, Op. 1, No. 2, which Trio was advertised as finished on May 9th, 1795, it follows that the study was at or near its end at that date. The conclusion of his instruction from Albrechtsberger may therefore be set down at between March and May, 1795.

INSTRUCTION FROM SALIERI

The third of Beethoven's teachers in Vienna was the Imperial Chapelmaster Anton Salieri; but this instruction was neither systematic nor confined to regular hours. Beethoven took advantage of Salieri's willingness "to give gratuitous instruction to musicians of small means." He wanted advice in vocal composition, and submitted to Salieri some settings of Italian songs which the latter corrected in respect of verbal accent and expression, rhythm, metrical articulation, subdivision of thought, mood, singableness, and the conduct of the melody which comprehended all these things. Having himself taken the initiative in this, Beethoven devoted himself earnestly and industriously to these exercises, and they were notably profitable in his creative work. "Thereafter [also in his German songs] he treated the text with much greater care than before in respect of its prosodic structure, as also of its contents and the prescribed situation," and acquired a good method of declamation. That Salieri's influence extended beyond the period in which Beethoven's style developed itself independently cannot be asserted, since many other and varied influences made themselves felt later.

This instruction began soon after Beethoven's arrival in Vienna and lasted in an unconstrained manner at least until 1802; at even a later date he asked counsel of Salieri in the composition of songs, particularly Italian songs. According to an anecdote related by Czerny, at one of these meetings for instruction Salieri found fault with a melody as not being appropriate to the air. The next day he said to Beethoven: "I can't get your melody out of my head." "Then, Herr von Salieri," replied Beethoven, "it cannot have been so utterly bad." The story may be placed in the early period; but it appears from a statement by Moscheles that Beethoven still maintained an association with Salieri in 1809. Moscheles, who was in Vienna at this time, found a note on Salieri's table which read: "The pupil Beethoven was here!"

Ries, speaking of the relations between Haydn, Albrechtsberger and Salieri as teachers and Beethoven as pupil, says: "I knew them all well; all three valued Beethoven highly, but were also of one mind touching his habits of study. All of them said Beethoven was so headstrong and self-sufficient (_selbstwollend_) that he had to learn much through harsh experience which he had refused to accept when it was presented to him as a subject of study." Particularly Albrechtsberger and Salieri were of this opinion; "the dry rules of the former and the comparatively unimportant ones of the latter concerning dramatic composition (according to the Italian school of the period) could not appeal to Beethoven." It is now known that the "dry rules" of Albrechtsberger could make a strong appeal to Beethoven as appertaining to theoretical study, and that the old method of composition to which he remained true all his life always had a singular charm for him as a subject of study and investigation.

Here, as in many other cases, the simple statement of the difficulties suggests their explanation. Beethoven the pupil may have honestly and conscientiously followed the precepts of his instructors in whatever he wrote in that character; but Beethoven the composer stood upon his own territory, followed his own tastes and impulses, wrote and wrought subject to no other control. He paid Albrechtsberger to teach him counterpoint--not to be the censor and critic of his compositions. And Ries's memory may well have deceived him as to the actual scope of the strictures made by the old master, and have transferred to the pupil what, fully thirty years before, had been spoken of the composer.

As has been mentioned, Beethoven's relations with Salieri at a later date were still pleasant; the composer dedicated to the chapelmaster the three violin sonatas, Op. 12, which appeared in 1799. Nothing is known of a dedication to Albrechtsberger. According to an anecdote related by Albrechtsberger's grandson Hirsch, Beethoven called him a "musical pedant"; yet we may see a remnant of gratitude toward his old teacher in Beethoven's readiness to take an interest in his young grandson.

We have now to turn our attention to Beethoven's relations to Viennese society outside of his study.

FOOTNOTES:

[63] Beethoven's first lodgings were in an attic-room which he soon exchanged for a room on the ground floor of a house No. 45 Alsterstrasse occupied by one Strauss, a printer. The house now on the site is No. 30. Another occupant of the house was Prince Lichnowsky, who soon after took him into his lodgings. He remained in this house until May, 1795.

[64] Or the beginning of 1794, since Haydn left Vienna on January 19, of that year.

[65] The excerpt from Schenk's autobiography which follows was communicated to Thayer by Otto Jahn and included in the appendix to Vol. II of the original edition of this biography. The present editor has followed Dr. Deiters in his presentation of the case in Vol. I of the revised edition.

[66] Haydn, according to Wurzbach, returned to Vienna on July 24, 1792.

[67] Schenk is in error as to both dates. He means, of course, 1793 and 1794.

[68] The investigations of Nottebohm, in "Beethoven's Studien" and "Beethoveniana," have been relied on in the compilation of the story of the study under Albrechtsberger, which takes the place of the original narrative by Thayer.

[69] Once Beethoven writes an unprepared seventh-chord with a suspension on the margin of an exercise and adds the query: "Is it allowed?"

Chapter XII

Music in Vienna in 1793--Theatre, Church and Concert-Room--A Music-Loving Nobility--The Esterhazys, Kinsky, Lichnowsky, von Kees and van Swieten--Composers: Haydn, Kozeluch, Förster and Eberl.

OPERA AND CONCERTS IN VIENNA

The musical drama naturally took the first place in the musical life of Vienna at this period. The enthusiasm of Joseph II for a national German opera, to which the world owed Mozart's exquisite "Entführung," proved to be but short-lived, and the Italian _opera buffa_ resumed its old place in his affections. The new company engaged was, however, equal to the performance of "Don Giovanni" and "Figaro" and Salieri's magnificent "Axur." Leopold II reached Vienna on the evening of March 13, 1790, to assume the crown of his deceased brother, but no change was, for the present, made in the court theatre. Indeed, as late as July 5 he had not entered a theatre, and his first appearance at the opera was at the performance of "Axur," September 21, in the company of his visitor King Ferdinand of Naples; but once firmly settled on the imperial throne, Joseph's numerous reforms successfully annulled, the Turkish war brought to a close and his diverse coronations happily ended, the Emperor gave his thoughts to the theatre. Salieri, though now but forty-one years of age, and rich with the observation and experience of more than twenty years in the direction of the opera, was, according to Mosel, graciously allowed, but according to other and better authorities, compelled, to withdraw from the operatic orchestra and confine himself to his duties as director of the sacred music in the court chapel and to the composition of one operatic work annually, if required. The "Wiener Zeitung" of January 28, 1792, records the appointment of Joseph Weigl, Salieri's pupil and assistant, now twenty-five years old, "as Chapelmaster and Composer to the Royal Imperial National Court Theatre with a salary of 1,000 florins." The title Composer was rather an empty one. Though already favorably known to the public,

he was forbidden to compose new operas for the court stage. To this end famous masters were to be invited to Vienna. A first fruit of this new order of things was the production of Cimarosa's "Il Matrimonio segreto," February 7, 1792, which with good reason so delighted Leopold that he gave the performers a supper and ordered them back into the theatre and heard the opera again _da capo_. It was among the last of the Emperor's theatrical pleasures; he died March 1st, and his wife on the 15th of May following. Thus for the greater part of the time from March 1 to May 24, the court theatres were shut; and yet during the thirteen months ending December 15, 1792, Italian opera had been given 180 times--134 times in the Burg and 46 times in the Kärnthnerthor-Theater--and ballet 163 times; so that, as no change for the present was made, there was abundance in these branches of the art for a young composer, like Beethoven, to hear and see. All accounts agree that the company then performing was one of uncommon excellence and its performances, with those of the superb orchestra, proved the value of the long experience, exquisite taste, unflagging zeal and profound knowledge of their recent head, Salieri. Such as Beethoven found the opera in the first week of November, 1792, such it continued for the next two years--exclusively Italian, but of the first order.

A single stroke of extraordinary good fortune--a happy accident is perhaps a better term--had just now given such prosperity to a minor theatrical enterprise that in ten years it was to erect and occupy the best playhouse in Vienna and, for a time, to surpass the Court Theatre in the excellence and splendor of its operatic performances. We mean Schikaneder's Theater auf der Wieden; but in 1793 its company was mean, its house small, its performances bad enough.

Schikaneder's chapelmaster and composer was John Baptist Henneberg; the chapelmaster of Marinelli, head of another German company in the Leopoldstadt, was Wenzel Müller, who had already begun his long list of 227 light and popular compositions to texts magical or farcical. Some two weeks after Beethoven's arrival in Vienna, on November 23rd, Schikaneder announced, falsely, the one-hundredth performance of "Die Zauberflöte," an opera the success of which placed his theatre a few years later upon a totally different footing, and brought Beethoven into other relations to it than those of an ordinary visitor indulging his comical taste, _teste_ Seyfried, for listening to and heartily enjoying very bad music.

The leading dramatic composers of Vienna, not yet named, must receive a passing notice. Besides Cimarosa, who left Vienna a few months later, Beethoven found Peter Dutillieu, a Frenchman by birth but an Italian musician by education and profession, engaged as composer for the Court Theatre. His "Il Trionfo d'Amore" had been produced there November 14, 1791, and his "Nanerina e Padolfino" had lately come upon the stage. Ignaz Umlauf, composer of "Die schöne Schusterin" and other not unpopular works, had the title of Chapelmaster and Composer to the German Court Opera, and was Salieri's substitute as chapelmaster in the sacred music of the Court Chapel. Franz Xavier Süssmayr, so well known from his connection with Mozart, was just now writing for Schikaneder's stage; Schenk for Marinelli's and for the private stages of the nobility; and Paul Wranitzky, first violinist and so-called Musikdirektor in the Court Theatre, author of the then popular "Oberon" composed for the Wieden stage, was employing his very respectable talents for both Marinelli and Schikaneder.

The church music of Vienna seems to have been at a very low point in 1792 and 1793. Two composers, however, whose names are still of importance in musical history, were then in that city devoting themselves almost exclusively to this branch of the art; Albrechtsberger, Court Organist, but in a few months (through the death of Leopold Hoffmann, March 17, 1793) to become musical director at St. Stephen's; and Joseph Eybler (some five years older than Beethoven), who had just become _Regens chori_ in the Carmelite church, whence he was called to a similar and better position in the Schottische Kirche two years later.

Public concerts, as the term is now understood, may be said not to have existed, and regular subscription concerts were few. Mozart gave a few series of them, but after his death there appears to have been no one of sufficient note in the musical world to make such a speculation remunerative. Single subscription concerts given by virtuosos, and annual ones by some of the leading resident musicians, of course, took place then as before and since. The only real and regular concerts were the four annual performances in the Burgtheater, two at Christmas and two at Easter, for the benefit of the musicians' widows and orphans. These concerts, established mainly by Gassmann and Salieri, were never exclusive in their programmes--oratorio, symphony, cantata, concerto, whatever would add to their attraction, found place. The stage was covered with the best musicians and vocalists of the capital and the superb orchestra was equally ready to accompany the playing of a Mozart or of an ephemeral _Wunderkind_. Risbeck was told ten years before that the number taking part in orchestra and chorus had even then on some occasions reached 400--a statement, however, which looks much like exaggeration.

Very uncommon semi-private concerts were still kept up in 1793. The reader of Mozart's biography will remember that in 1782 this great composer joined a certain Martin in giving a series of concerts during the morning hours in the Augarten Hall, most of the performers being dilettanti and the music being furnished from the library of von Kees. These concerts found such favor that they

were renewed for several years and generally were twelve in number.

Ladies of even the highest nobility permitted themselves to be heard. The auditorium was extremely brilliant and everything was conducted in so orderly and decent a fashion that everybody was glad to support the institute to the best of his energies. The receipts from the chief subscription were expended entirely on the cost of the concerts. Later Herr Rudolph assumed the direction. (“Allg. Mus. Zeitung,” III, 45.)

This man, still young, and a fine violin-player, was the director when Beethoven came to Vienna, and the extraordinary spectacle was still to be seen of princes and nobles following his lead in the performance of orchestral music to an audience of their own class at the strange hours of from 6 to 8 in the morning!

From the above it appears that Vienna presented to the young musician no preëminent advantages either in opera, church-music or its public concerts. Other cities equalled the Austrian capital in the first two, and London was then far in advance of all in the number, variety and magnificence of the last. It was in another field that Vienna surpassed every competitor. As Gluck twenty years before had begun the great revolution in operatic music completed by Mozart, so Haydn, building on the foundation of the Bachs and aided by Mozart, was effecting a new development of purely instrumental music which was yet to reach its highest stage through the genius and daring of the youth now his pupil. The example set by the Austrian family through so many generations had produced its natural effect, and a knowledge of and taste for music were universal among the princes and nobles of the empire. Some of the more wealthy princes, like Esterhazy, maintained musical establishments complete even to the Italian opera; others were contented with hearing the mass sung in their house-chapel to an orchestral accompaniment; where this was impossible, a small orchestra only was kept up, often composed of the officials and servants, who were selected with regard to their musical abilities; and so down to the band of wind-instruments, the string quartet, and even to a single organ-player, pianist or violinist. What has been said in a former chapter of music as a quasi-necessity at the courts of the ecclesiastical princes, applies in great measure to the secular nobility. At their castles and country-seats in the summer, amusement was to be provided for many an otherwise tedious hour; and in their city residences during the winter they and their guests could not always feast, dance or play at cards; and here, too, music became a common and favored recreation. At all events, it was the fashion. Outside the ranks of the noble-born, such as by talents, high culture or wealth occupied high social positions, followed the example and opened their salons to musicians and lovers of music, moved thereto for the most part by a real, rarely by a pretended, taste for the art--in either case aiding and encouraging its progress. Hence, an enormous demand for chamber music, both vocal and instrumental, especially the latter. The demand created the supply by encouraging genius and talent to labor in that direction; and thus the Austrian school of instrumental music soon led the world, as in the previous generation the demand for oratorios in England gave that country the supremacy in that branch of art.

During certain months of the year, Vienna was filled with the greatest nobles, not only of the Austrian states, but of other portions of the German Empire. Those who spent their time mostly in their own small courts came up to the capital but for a short season; others reversed this, making the city their usual residence and visiting their estates only in summer. By the former class many a once (if not still) famous composer in their service was thus occasionally for short periods brought to the metropolis--as Mozart by the brutal Archbishop of Salzburg, and Haydn by Prince Esterhazy. By the latter class many of the distinguished composers and virtuosos resident in the city were taken into the country during the summer to be treated as equals, to live like gentlemen among gentlemen. Another mode of encouraging the art was the ordering or purchasing of compositions; and this not only from composers of established reputation, as Haydn, Mozart, C. P. E. Bach, but also from young and as yet unknown men; thus affording a twofold benefit--pecuniary aid and an opportunity of exhibiting their powers.

The instrumental virtuosos, when not permanently engaged in the service of some prince or theatre, looked in the main for the reward of their studies and labors to the private concerts of the nobility. If at the same time they were composers, it was in such concerts that they brought their productions to a hearing. The reader of Jahn’s biography of Mozart will remember how much even he depended upon this resource to gain the means of support for himself and family. Out of London, even so late as 1793, there can hardly be said to have existed a “musical public,” as the term is now understood, and in Vienna at least, with its 200,000 inhabitants, a virtuoso rarely ventured to announce a concert to which he had not already a subscription, sufficient to ensure him against loss, from those at whose residences he had successfully exhibited his skill. Beethoven, remaining “in Vienna without salary until recalled” by Max, found in these resources and his pupils an ample income.

But this topic requires something more than the above general remarks. Some twelve years previous to Beethoven’s coming to Vienna, Risbeck, speaking of the art in that capital, had written:

ORCHESTRAS OF THE GREAT NOBLES

Musicians are the only ones (artists) concerning whom the nobility exhibit taste. Many houses maintain private bands for their own delectation, and all the public concerts prove that this field of art stands in high respect. It is possible to enlist four or five large orchestras here, all of them incomparable. The number of real virtuosos is small, but as regards the orchestral musicians scarcely anything more beautiful is to be heard in the world.

TITLED MUSIC-LOVERS IN VIENNA

How many such orchestras were still kept up in 1792-'93 it is, probably, now impossible to determine. Those of Princes Lobkowitz, Schwarzenberg and Auersperg may safely be named. Count Heinrich von Haugwitz and doubtless Count Batthyany brought their musicians with them when they came to the capital for "the season." The Esterhazy band, dismissed after the death of Haydn's old master, seems not yet to have been renewed. Prince Grassalkowitz (or Kracsalkowitz) had reduced his to a band of eight wind-instruments--oboes, clarinets, bassoons, horns--a kind of organization then much in vogue. Baron Braun had one to play at dinner as at the supper in "Don Giovanni"--an accessory to the scene which Mozart introduced out of his own frequent experience. Prince Karl Lichnowsky and others retained their own players of string quartets.

The grandees of the Bohemian and Moravian capitals--Kinsky, Clamm, Nostiz, Thun, Buquoi, Hartig, Salm-Pachta, Sporck, Fünfkirchen, etc.--emulated the Austrian and Hungarian nobles. As many of them had palaces also in Vienna, and most, if not all, spent part of the year there, bringing with them a few of the more skilful members of their orchestras to execute chamber music and for the nucleus of a band when symphonies, concertos and grand vocal works were to be executed, they also added their contingent to the musical as well as to the political and fashionable life of the metropolis. The astonishingly fruitful last eight years of Mozart's life falling within the period now under contemplation, contributed to musical literature compositions wonderfully manifold in character and setting an example that forced other composers to leave the beaten track. Haydn had just returned from his first stay in London, enriched with the pregnant experience acquired during that visit. Van Swieten had gained during his residence in Berlin appreciation of and love for the works of Handel, Bach and their schools, and since his return to Vienna, about 1778, had exerted, and was still exerting, a very powerful and marked influence upon Vienna's musical taste.

Thus all the conditions precedent for the elevation of the art were just at this time fulfilled at Vienna, and in one department--that of instrumental music--they existed in a degree unknown in any other city. The extraordinary results as to the quantity produced in those years may be judged from the sale-catalogue (1779) of a single music-dealer, Johann Traeg, which gives of symphonies, symphonies-concertantes and overtures (the last being in a small minority) the extraordinary number of 512. The music produced at private concerts given by the nobility ranged from the grand oratorios, operas, symphonies, down to variations for the pianoforte and to simple songs. Leading musicians and composers, whose circumstances admitted of it, also gave private concerts at which they made themselves and their works known, and to which their colleagues were invited. Prince Lobkowitz, at the time Beethoven reached Vienna, was a young man of twenty years. He was born on December 7, 1772, and had just married, on August 2, a daughter of Prince Schwarzenberg. He was a violinist of considerable powers and so devoted a lover of music and the drama, so profuse a squanderer of his income upon them, as in twenty years to reduce himself to bankruptcy. Precisely Beethoven's supposed age, the aristocrat of wealth and power and the aristocrat of talent and genius became exceedingly intimate, occasionally quarrelling and making up their differences as if belonging by birth to the same sphere.

The reigning Prince Esterhazy was that Paul Anton who, after the death of his father on February 25, 1790, broke up the musical establishment at Esterhaz and gave Haydn relief from his thirty years of service. He died on January 22, 1794, and was succeeded by his son Nicholas, a young man just five years older than Beethoven. Prince Nicholas inherited his grandfather's taste for music, reëngaged an orchestra, and soon became known as one of the most zealous promoters of Roman Catholic church-music. The best composers of Vienna, including Beethoven, wrote masses for the chapel at Esterhaz, where they were performed with great splendor.

Count Johann Nepomuk Esterhazy, "of the middle line zu Frakno," was a man of forty-five years, a good performer upon the oboe, and (which is much to his credit) had been a firm friend and patron of Mozart.

Of Count Franz Esterhazy, a man of thirty-five years, Schönfeld, in his "Jahrbuch der Tonkunst," thus speaks: "This great friend of music at certain times of the year gives large and splendid concerts at which, for the greater part, large and elevated compositions are performed--particularly the choruses of Handel, the 'Sanctus' of Emanuel Bach, the 'Stabat Mater' of Pergolese, and the like. At these concerts there are always a number of the best virtuosos."

It was not the present Prince Joseph Kinsky (who died in 1798 in his forty-eighth year) who at a later period became a distinguished patron of Beethoven, but his son Ferdinand Johann Nepomuk, then a bright boy of eleven years, born on December 4, 1781, upon whose youthful taste the strength, beauty and novelty of that composer's works made a deep impression. Prince Carl Lichnowsky, the pupil and friend of Mozart, had a quartet concert at his dwelling every Friday morning. The regularly engaged musicians were Ignaz Schuppanzigh, son of a professor in the Real-Schule, and a youth at this time of sixteen years (if the musical lexica are to be trusted), first violin; Louis Sina, pupil of Förster, also a very young man, second violin; Franz Weiss, who completed his fifteenth year on January 18, 1793, viola; and Anton Kraft, or his son Nicholas, a boy of fourteen years (born December 18, 1778), violoncello. It was, in fact, a quartet of boy virtuosos, of whom Beethoven, several years older, could make what he would.

The Prince's wife was Marie Christine, twenty years of age, one of those "Three Graces," as Georg Förster called them, daughters of that Countess Thun in whose house Mozart had found such warm friendship and appreciation, and whose noble qualities are so celebrated by Burney, Reichardt and Förster. The Princess, as well as her husband, belonged to the better class of amateur performers upon the pianoforte.

Court Councillor von Kees, Vice-President of the Court of Appeals of Lower Austria, was still living. He was, says Gyrowetz, speaking of a period a few years earlier, "recognized as the foremost music-lover and dilettante in Vienna; and twice a week he gave in his house society concerts at which were gathered together the foremost virtuosos of Vienna, and the first composers, such as Joseph Haydn, Mozart, Dittersdorf, Hoffmeister, Albrechtsberger, Giarnovichi and so on. Haydn's symphonies were played there." In Haydn's letters to Madame Genzinger the name of von Kees often occurs--the last time in a note of August 4, 1792, which mentions that the writer is that day to dine with the Court Councillor. This distinguished man left on his death (January 5, 1795) a very extensive collection of music.

Gottfried, Freiherr van Swieten, son of Maria Theresia's famous Dutch physician, says Schönfeld, is,

VAN SWIETEN AND HIS INFLUENCE

as it were, looked upon as a patriarch of music. He has taste only for the great and exalted. He himself many years ago composed twelve beautiful symphonies ("stiff as himself," said Haydn). When he attends a concert our semi-connoisseurs never take their eyes off him, seeking to read in his features, not always intelligible to every one, what ought to be their opinion of the music. Every year he gives a few large and brilliant concerts at which only music by the old masters is performed. His preference is for the Handelian manner, and he generally has some of Handel's great choruses performed. As late as last Christmas (1794) he gave such a concert at Prince von Paar's, at which an oratorio by this master was performed.

Neukomm told Prof. Jahn that in concerts, "if it chanced that a whispered conversation began, His Excellency, who was in the habit of sitting in the first row of seats, would rise solemnly, draw himself up to his full height, turn to the culprits, fix a long and solemn gaze upon them, and slowly resume his chair. It was effective, always." He had some peculiar notions of composition; he was, for instance, fond of imitations of natural sounds in music and forced upon Haydn the imitation of frogs in "The Seasons." Haydn himself says:

This entire passage in imitation of a frog did not flow from my pen. I was constrained to write down the French croak. At an orchestral performance this wretched conceit soon disappears, but it cannot be justified in a pianoforte score. Let the critics be not too severe on me. I am an old man and cannot revise all this again.

But to van Swieten, surely, is due the credit of having founded in Vienna a taste for Handel's oratorios and Bach's organ and pianoforte music, thus adding a new element to the music there. The costs of the oratorio performances were not, however, defrayed by him, as Schönfeld seems to intimate. They were met by the association called by him into being, and of which he was perpetual secretary, whose members were the Princes Liechtenstein, Esterhazy, Schwarzenberg, Auersperg, Kinsky, Trautmannsdorf, Sinsendorf, and the Counts Czernin, Harrach, Erdödy and Fries; at whose palaces as well as in van Swieten's house and sometimes in the great hall of the Imperial Royal Library the performances were given at midday to an audience of invited guests. Fräulein Martinez, who holds so distinguished a place in Burney's account of his visit to Vienna--that pupil of Porpora at whose music-lessons the young Joseph Haydn forty years before had been employed as accompanist--still flourished in the Michael's House and gave a musical party every Saturday evening during the season.

Court Councillor and Chamber Paymaster von Meyer (says Schönfeld) is so excellent a lover of music that his entire personnel in the chancellary is musical, among them being such artists as a Raphael and a Hauschka. It will readily be understood, therefore,

that here in the city as well as at his country-seat there are many concerts. His Majesty the Emperor himself has attended some of these concerts.

These details are sufficient to illustrate and confirm the remarks made above upon Vienna as the central point of instrumental music. Of the great number of composers in that branch of the art whom Beethoven found there, a few of the more eminent must be named.

FAMOUS COMPOSERS IN VIENNA

Of course, Haydn stood at the head. The next in rank--_longo intervallo_--was Mozart's successor in the office of Imperial Chamber Composer, Leopold Kozeluch, a Bohemian, now just forty years of age. Though now forgotten and, according to Beethoven, "miserabilis," he was renowned throughout Europe for his quartets and other chamber music. A man of less popular repute but of a solid genius and acquirements far beyond those of Kozeluch, whom Beethoven greatly respected and twenty-five years later called his "old master," was Emanuel Aloys Förster, a Silesian, now forty-five years of age. His quintets, quartets and the like ranked very high, but at that time were known for the most part only in manuscript. Anton Eberl, five years the senior of Beethoven, a Viennese by birth, had composed two operettas in the sixteenth year of his age which were produced at the Kärnthnerthor-Theater, one of which gained the young author the favor of Gluck. He seems to have been a favorite of Mozart and caught so much of the spirit and style of that master as to produce compositions which were printed by dishonest publishers under Mozart's name, and as his were sold throughout Europe. In 1776 he accompanied the Widow Mozart and her sister, Madame Lange, the vocalist, in the tour through Germany, gaining that reputation in other cities which he enjoyed at home, both as pianist and composer. His force was in instrumental composition, and we shall hereafter see him for a moment as a symphonist bearing away the palm from Beethoven!

Johann Vanhall, whose name was so well known in Paris and London that Burney, twenty years before, sought him out in his garret in a suburb of Vienna, was as indefatigable as ever in production. Gerber says in his first Lexicon (1792) that Breitkopf and Härtel had then fifty of his symphonies in manuscript. His fecundity was equal to that of Haydn; his genius such that all his works are now forgotten. It is needless to continue this list.

One other fact illustrating the musical tastes and accomplishments of the higher classes of the capital may be added. There were, during the winter 1792-93, ten private theatres with amateur companies in activity, of which the more important were in the residences of the nobles Stockhammer, Kinsky, Sinsendorf and Strassaldo, and of the bookseller Schrambl. Most of these companies produced operas and operettas.

Chapter XIII

Beethoven in Society--Concerts--Wegeler's Recollections--Compositions--The First Trios--Sonatas Dedicated to Haydn--Variations--Dances for the Ridotto Rooms--Plays at Haydn's Concert.

However quiet and "without observation" Beethoven's advent in Vienna may have been at that time when men's minds were occupied by movements of armies and ideas of revolution, he could hardly have gone thither under better auspices. He was Court Organist and Pianist to the Emperor's uncle; his talents in that field were well known to the many Austrians of rank who had heard him in Bonn when visiting there or when paying their respects to the Elector in passing to and from the Austrian Netherlands; he was a pupil of Joseph Haydn--a circumstance in itself sufficient to secure him a hearing; and he was protected by Count Waldstein, whose family connections were such that he could introduce his favorite into the highest circles, the imperial house only excepted. Waldstein's mother was a Liechtenstein; his grandmother a Trautmannsdorf; three of his sisters had married respectively into the families Dietrichstein, Crugenburg and Wallis; and by the marriages of uncles and aunts he was connected with the great houses Oettingen-Spielberg, Khevenhüller-Melisch, Kinsky, Palfy von Erdöd and Ulfeld--not to mention others less known. If the circle be extended by a degree or two it embraces the names Kaunitz, Lobkowitz, Kohary, Fünfkirchen, Keglevics and Colloredo-Mansfeld.

Dr. Burney, in closing his "Present State of Music in Germany," notes the distinction in the styles of composition and performance in some of the principal cities of that country, "Vienna being most remarkable for fire and animation; Mannheim for neat and brilliant execution; Berlin for counterpoint and Brunswick for taste." Since Burney's tour (1772) Vienna had the highest example of all these qualities united in Mozart. But he had passed away, and no great pianist of the first rank remained; there were extraordinary dilettanti and professional pianists "of very neat and brilliant execution," but none who possessed great "fire, animation and invention," qualities still most valued in Vienna and in which the young Beethoven, with all the hardness and heaviness of manipulation caused by his devotion to the organ, was wholly unrivalled. With all the salons in the metropolis open to him, his

success as a virtuoso was, therefore, certain. All the contemporary authorities, and all the traditions of those years, agree in the fact of that success, and that his playing of Bach's preludes and fugues especially, his reading of the most difficult scores at sight and his extemporaneous performances excited ever new wonder and delight. Schindler records that van Swieten, after musical performances at his house, "detained Beethoven and persuaded him to add a few fugues by Sebastian Bach as an evening blessing," and he preserves a note without date, though evidently belonging to Beethoven's first years in Vienna, which proves how high a place the young man had then won in the old gentleman's favor:

To Mr. Beethoven in Alstergasse, No. 45, with the Prince Lichnowsky: If there is nothing to hinder next Wednesday I should be glad to see you at my home at half past 8 with your nightcap in your bag. Give me an immediate answer.

Swieten.

There is also an entry in the oft-cited memorandum book belonging in date to October or November, 1793, which may be given in this connection: "Supped in the evening at Swieten's, 17 pourboire. To the janitor 4 x for opening the door."

THE THREE TRIOS, OP. 1

But the instant and striking success of Beethoven as virtuoso by no means filled up the measure of his ambition. He aspired to the higher position of composer, and to obtain this more was needed than the performance of variations, however excellent. To this end he selected the three Trios afterwards published as Op. 1, and brought them to performance at the house of Prince Lichnowsky. Happily for us, Beethoven related some particulars concerning this first performance of these compositions in Vienna to his pupil Ries, who gives the substance of the story thus:

It was planned to introduce the first three Trios of Beethoven, which were about to be published as Op. 1, to the artistic world at a soirée at prince Lichnowsky's. Most of the artists and music-lovers were invited, especially Haydn, for whose opinion all were eager. The Trios were played and at once commanded extraordinary attention. Haydn also said many pretty things about them, but advised Beethoven not to publish the third, in C minor. This astonished Beethoven, inasmuch as he considered the third the best of the Trios, as it is still the one which gives the greatest pleasure and makes the greatest effect. Consequently, Haydn's remark left a bad impression on Beethoven and led him to think that Haydn was envious, jealous and ill-disposed toward him. I confess that when Beethoven told me of this I gave it little credence. I therefore took occasion to ask Haydn himself about it. His answer, however, confirmed Beethoven's statement; he said he had not believed that this Trio would so quickly and easily be understood and so favorably received by the public.

The Fischoff manuscript says:

The three Trios for pianoforte, violin and violoncello, Op. 1 (the pearls of all sonatas), which are in fact his sixth work, justly excited admiration, though they were performed in only a few circles. Wherever this was done, however, connoisseurs and music-lovers bestowed upon them undivided applause, which grew with the succeeding works as the hearers not only accustomed themselves to the striking and original qualities of the master but grasped his spirit and strove for the high privilege of understanding him.

More than two years passed by, however, before the composer thought fit to send these Trios to the press; perhaps restrained by a feeling of modesty, since he was still a student, perhaps by a doubt as to the success of compositions so new in style, or by prudence, choosing to delay their publication until they had been so often performed from the manuscript as to secure their comprehension and appreciation, and thus an adequate number of subscribers. In the meantime he prepared the way for them by publishing a few sets of variations. "Beethoven had composed variations on themes from Mozart's 'Zauberflöte,' which he had already sketched in Bonn, and Zmeskall took it upon himself to submit them to a publisher; but they had only a small sale." (The Fischoff MS.) This refers doubtless to the Variations "Se vuol ballare" from "Le Nozze di Figaro," which, having been revised and improved by a new coda, came out in July, 1793, with a dedication to Eleonore von Breuning. It was not until the next year that the thirteen variations upon the theme "Es war einmal ein alter Mann," from Dittersdorf's "Rothkäppchen," appeared, and these were followed by those for four hands on the Waldstein theme, first advertised in January, 1795.

In fact, Beethoven evidently was in no haste to publish his compositions. It will presently be seen that he sent the "Se vuol ballare" variations to press partly at the request of others and partly to entrap the rival pianists of Vienna. A few years later we shall find him dashing off and immediately publishing variations on popular theatrical melodies; but works of greater scope, and especially his pianoforte concertos, were for the most part long retained in his exclusive possession. Thus the Pianoforte Concerto in B-flat major, Op. 18, though supposed by Tomaschek to have been composed at Prague in 1798, certainly (if Beethoven's own words in a letter

to Breitkopf and Härtel are to be believed) preceded in composition that in C major, Op. 15, and must, therefore, have been finished at the latest in March, 1795, and was doubtless often played by him at private concerts during the period now before us. It was not published until 1801.

Let the reader now recall to mind some of the points previously dwelt upon: the Fischenich letter of January and Neefe's letter of October, 1793, which record the favorable reports sent to Bonn of Beethoven's musical progress; his studies with Haydn and Schenk; the cares and perplexities caused him temporarily by the death of his father, and the unpleasant circumstances attending that event; his steady success as a virtuoso; his visit in the summer to Prince Esterhazy; and it is obvious with what industry and energy he engaged in his new career, with what zeal and unfaltering activity he labored to make the most of his opportunities. In one year after leaving Bonn he felt his success secure, and no longer feared Hamlet's "slings and arrows of outrageous fortune." This is indicated in a passage ("O, how we shall then rejoice together," etc.) of the earliest of his Vienna letters which has been preserved--that letter in which, as Wegeler remarks, "he asked pardon for much more error than he had committed," and which, though often reprinted from the "Notizen," is too important and characteristic to be here omitted.

BEETHOVEN SUES FOR PARDON

Vienna, November 2, 93.

Most estimable Leonore! My most precious friend!

Not until I have lived almost a year in the capital do you receive a letter from me, and yet you were most assuredly perpetually in my liveliest memory. Often in thought I have conversed with you and your dear family, though not with that peace of mind which I could have desired. It was then that the wretched misunderstanding hovered before me and my conduct presented itself as most despicable. But it was too late. O, what would I not give could I obliterate from my life those actions so degrading to myself and so contrary to my character. True, there were many circumstances which tended to estrange us, and I suspect that tales whispered in our ears of remarks made one about the other were chiefly that which prevented us from coming to an understanding. We both believed that we were speaking from conviction; whereas it was only in anger, and we were both deceived. Your good and noble character, my dear friend, is sufficient assurance to me that you forgave me long ago. But we are told that the sincerest contrition consists in acknowledgment of our faults; and to do this has been my desire. And now let us drop the curtain on the affair, only drawing from it this lesson--that when friends quarrel it is much better to have it out face to face than to turn to a go-between.

With this you will receive a dedication from me to you concerning which I only wish that the work were a larger one and more worthy of you. I was plagued here to publish the little work, and I took advantage of the opportunity, my estimable E., to show my respect and friendship for you and my enduring memory of your family. Take this trifle and remember that it comes from a friend who respects you greatly. Oh, if it but gives you pleasure, my wishes will be completely fulfilled. Let it be a reminder of the time when I spent so many and such blessed hours at your home. Perhaps it will keep me in your recollection until I eventually return to you, which, it is true, is not likely to be soon. But how we shall rejoice then, my dear friend--you will then find in your friend a happier man, from whose visage time and a kindlier fate shall have smoothed out all the furrows of a hateful past.

If you should chance to see B. Koch, please say to her that it is not nice of her never once to have written to me. I wrote to her twice and three times to Malchus, but no answer. Say to her that if she doesn't want to write she might at least urge Malchus to do so. In conclusion I venture a request; it is this: I should like once again to be so happy as to own a waistcoat knit of hare's wool by your hands, my dear friend. Pardon the immodest request, my dear friend, but it proceeds from a great predilection for everything that comes from your hands. Privately I may also acknowledge that a little vanity is also involved in the request; I want to be able to say that I have something that was given me by the best and most estimable girl in Bonn. I still have the waistcoat which you were good enough to give me in Bonn, but it has grown so out of fashion that I can only treasure it in my wardrobe as something very precious because it came from you. You would give me much pleasure if you were soon to rejoice me with a dear letter from yourself. If my letters should in any way please you I promise in this to be at your command so far as lies in my power, as everything is welcome to me which enables me to show how truly I am

Your admiring, true friend L. v. Beethoven.

P.S. The V. [variations] you will find a little difficult to play, especially the trills in the _coda_; but don't let that alarm you. It is so contrived that you need play only the trill, leaving out the other notes because they are also in the violin part. I never would have composed a thing of the kind had I not often observed that here and there in Vienna there was somebody who, after I had

improvised of an evening, noted down many of my peculiarities, and made parade of them next day as his own. Foreseeing that some of these things would soon appear in print, I resolved to anticipate them. Another reason that I had was to embarrass the local pianoforte masters. Many of them are my deadly enemies and I wanted to revenge myself on them, knowing that once in a while somebody would ask them to play the variations and they would make a sorry show with them.

Except Beethoven's memorandum, "Schuppanzigh 3 times each W.; Albrechtsberger 3 times each W.", which indicates his change of instructors, there is nothing to be recorded until, probably in May or June (1794), we come to the fragment of another letter to Eleonore von Breuning also contained in Wegeler's "Notizen" (p. 60), which has particular interest both as showing how bitterly his conscience reproached him for acts inconsistent with the forbearance and command of temper due to friendship, but in which he ever remained too apt to indulge, and as adding some implied confirmation of the argument previously made in relation to the compositions of the Bonn period. In this letter he acknowledges receipt of a cravat embroidered by Eleonore and protests that thoughts of her generosity and his unworthiness had brought him to tears. He continues: "Do pray believe me that little as I have deserved it, _my friend_ (let me always call you such), I have suffered much and still suffer from the loss of your friendship.... As a slight return for your kind recollection of me I take the liberty of sending these Variations and the Rondo with violin (accompaniment). I have a great deal to do or I should have transcribed the Sonata I promised you long ago. It is a mere sketch in manuscript, and to copy it would be a difficult, etc." The letter is signed: "The friend who still reveres you, Beethowen" (_sic_).[70]

In January, 1794, Elector Max had paid a short visit to Vienna, where, perhaps, it was determined that Beethoven should remain "without salary until recalled." After the declaration of war by the Empire against France, the electorate, as a German state, could no longer remain neutral; and thus it came to pass that in October the victorious French army marched into Bonn. The Elector fled to Frankfort-on-the-Main, November 6th, thence to Münster, while his court and all such as were obnoxious to the republican authorities dispersed in all directions for safety.

One of these fugitives, a young man of twenty-nine years but already the Rector of the University, to "save his head" hastened away to Vienna--Dr. Wegeler. He reached that capital in October and found Beethoven not in the "room on the ground floor" where "it was not necessary to pay the housekeeper more than 7 florins," but living as a guest in the family of Prince Karl Lichnowsky; and this explains sufficiently the cessation of those records of monthly payments before noticed.

DR. WEGELER'S REMINISCENCES

The reminiscences of Wegeler for the period of his stay in Vienna, excepting those which may be better introduced chronologically in other connections, may well find place here. They are interesting and characteristic in themselves and indicate, also, the great change for the better in Beethoven's pecuniary condition; for a man who keeps a servant and a horse cannot, if honest, be a sufferer from poverty:

Carl, Prince of Lichnowsky, Count Werdenberg, Dynast Granson, was a very great patron, yes, a friend of Beethoven's, who took him into his house as a guest, where he remained at least a few years. I found him there toward the end of the year 1794, and left him there in the middle of 1796. Meanwhile, however, Beethoven had almost always a home in the country.

The Prince was a great lover and connoisseur of music. He played the pianoforte, and by studying Beethoven's pieces and playing them more or less well, sought to convince him that there was no need of changing anything in his style of composition, though the composer's attention was often called to the difficulties of his works. There were performances at his house every Friday morning, participated in by four hired musicians--Schuppanzigh, Weiss, Kraft and another (Link?), besides our friend; generally also an amateur, Zmeskall. Beethoven always listened with pleasure to the observations of these gentlemen. Thus, to cite a single instance, the famous violoncellist Kraft in my presence called his attention to a passage in the finale of the Trio, Op. 1, No. 3, to the fact that it ought to be marked "sulla corda G," and the indication 4-4 time which Beethoven had marked in the finale of the second Trio, changed to 2-4. Here the new compositions of Beethoven, so far as was feasible, were first performed. Here there were generally present several great musicians and music-lovers. I, too, as long as I lived in Vienna, was present, if not every time, at least most of the time.

Here a Hungarian count once placed a difficult composition by Bach in manuscript before him which he played _a vista_ exactly as Bach would have played it, according to the testimony of the owner. Here the Viennese author Förster once brought him a quartet of which he had made a clean copy only that morning. In the second portion of the first movement the violoncello got out. Beethoven stood up, and still playing his own part sang the bass accompaniment. When I spoke about it to him as a proof of extraordinary acquirements, he replied with a smile: "The bass part _had_ to be so, else the author would have known nothing

about composition." To the remark that he had played a _presto_ which he had never seen before so rapidly that it must have been impossible to see the individual notes, he answered: "Nor is that necessary; if you read rapidly there may be a multitude of typographical errors, but you neither see nor give heed to them, so long as the language is a familiar one."

After the concert the musicians generally stayed to dine. Here there gathered, in addition, artists and savants without regard to social position. The Princess Christiane was the highly cultivated daughter of Count Franz Joseph von Thun, who, a very philanthropic and respectable gentleman, was disposed to extravagant enthusiasm by his intercourse with Lavater, and believed himself capable of healing diseases through the power of his right hand.

The following undated letter also belongs to the years of Beethoven's intimate association with Wegeler in Vienna (1794-96). It is significant of Beethoven's character. Though easily offended and prone to anger, no sooner was the first ebullition of temper past than he was so reconciliatory and open to explanation that usually his contrition was out of all proportion to his fault. For this reason, and because it presents the friend in a light which provoked a protest from his modesty, Wegeler was unwilling to make public the entire letter.[71]

CONFESSION, CONTRITION, PETITION

Dearest! Best! In what an odious light you have exhibited me to myself! I acknowledge it, I do not deserve your friendship. You are so noble, so considerate, and the first time that I ranged myself alongside of you I fell so far below you! Ah, for weeks I have displeased my best and noblest friend! You think that I have lost some of my goodness of heart, but, thank Heaven! it was no intentional or deliberate malice which induced me to act as I did towards you; it was my inexcusable thoughtlessness which did not permit me to see the matter in its true light. O, how ashamed I am, not only for your sake but also my own. I can scarcely trust myself to ask for your friendship again. Oh, Wegeler, my only comfort lies in this, that you have known me almost from my childhood, and yet, O let me say for myself, I was always good, and always strove to be upright and true in my actions--otherwise how could you have loved me? Could I have changed so fearfully for the worse in such a short time? Impossible; these feelings of goodness and love of righteousness cannot have died forever in me in a moment. No, Wegeler, dearest, best, O, venture again to throw yourself entirely into the arms of your B.; trust in the good qualities you used to find in him; I will guarantee that the pure temple of sacred friendship which you erect shall remain firm forever; no accident, no storm shall ever shake its foundations--firm--forever--our friendship--pardon--oblivion--a new upflaming of the dying, sinking friendship--O, Wegeler, do not reject this hand of reconciliation. Place yours in mine--O, God!--but no more; I am coming to throw myself in your arms, to entreat you to restore to me my lost friend. And you will give yourself to me, your penitent, loving, never-forgetting

Beethoven again.

It was only now that I received your letter, because I have just returned home.

In this connection Wegeler comes to speak of the outward conditions of Beethoven: "Beethoven," he says on page 33,

brought up under extremely restricted circumstances, and as it were, under guardianship, though that of his friends, did not know the value of money and was anything but economical. Thus, to cite a single instance, the Prince's dinner hour was fixed at 4 o'clock. "Now," said Beethoven, "it is desired that every day I shall be at home at half-past 3, put on better clothes, care for my beard, etc.--I can't stand that!" So it happened that he frequently went to the taverns, since, as has been said, in this as in all other matters of economy, he knew nothing about the value of things or of money. The Prince, Wegeler continues, who had a loud, metallic voice, once directed his serving-man that if ever he and Beethoven should ring at the same time the latter was to be first served. Beethoven heard this, and the same day engaged a servant for himself. In the same manner, once when he took a whim to learn to ride, which speedily left him, the stable of the Prince being offered him, he bought a horse.

Concerning his friend's affairs of the heart, Wegeler had opportunity to make observations in Vienna. He relates on page 43 that while he was in the capital Beethoven "was always in love and made many conquests which would have been difficult if not impossible for many an Adonis." Beethoven's antipathy to teaching before he left Bonn has already been noticed. In Vienna he developed a still stronger repugnance to playing in society when requested to do so. He often complained to Wegeler how grievously this put him out of sorts, whereupon the latter sought to entertain him and quiet him by conversation. "When this purpose was reached," he continues,

I dropped the conversation, seated myself at the writing table, and Beethoven, if he wanted to continue the discourse, had to sit down on the chair before the pianoforte. Soon, still turned away from the instrument, he aimlessly struck a few chords out of which

gradually grew the most beautiful melodies. Oh, why did I not understand more of music! Several times I put ruled paper upon the desk as if without intention, in order to get a manuscript of his; he wrote upon it but then folded it up and put it in his pocket! Concerning his playing I was permitted to say but little, and that only in passing. He would then go away entirely changed in mood and always come back again gladly. The antipathy remained, however, and was frequently the cause of differences between Beethoven and his friends and well-wishers.

OLD BONN FRIENDS REMEMBERED

There is still one other reminiscence of Wegeler in the appendix to the “Notizen” (page 9) worthy of citation. “At one time private lectures were given in Vienna on Kant, which had been arranged by Adam Schmidt, Wilhelm Schmidt, Hunczovsky, Göpfert and others. In spite of my urgings Beethoven refused to attend a single one of them.” There is no reference in Wegeler’s “Notizen” to instruction received by Beethoven from Albrechtsberger. With his old colleague in the Court Orchestra in Bonn, Nicolaus Simrock, though he was a much older man, Beethoven remained in touch after his removal to Vienna. Simrock, who was highly esteemed both as man and musician, had embarked in business as a music publisher in Bonn. The Variations on a theme from Dittersdorf’s “Rothkäppchen,” were published by him (at the latest in the early part of 1794), as well as those for pianoforte four hands on a theme by Count Waldstein (some time in the same year). It is to the latter composition that the following letter refers:

Vienna, August 2, 1794.

Dear Simrock:

I deserve a little scolding from you for holding back your Variations so long, but, indeed, I do not lie when I say that I was hindered from correcting them sooner by an overwhelming amount of business. You will note the shortcomings for yourself, but I must wish you joy on the appearance of your engraving, which is beautiful, clear and legible. Verily, if you keep on thus you will become chief among cutters, that is, note cutters[72]. In my former letter I promised to send you something of mine and you interpreted the remark as being in the language of the cavaliers. How have I deserved such a title? Faugh! who would indulge in such language in these democratic days of ours? To free myself from the imputation as soon as I have finished the grand revision of my compositions, which will be soon, you shall have something which you will surely engrave. I have also been looking about me for a commissioner and have found a right capable young fellow for the place. His name is Traeg. You have naught to do but to write to him or me about the conditions which you want to make. He asks of you one-third _rabate_. The devil take all such bargaining! It is very hot here. The Viennese fear that they will soon be unable to eat ice-cream, there having been little cold last winter and ice being scarce. Many persons of importance have come here and it was said that a revolution was imminent; but it is my belief that so long as the Austrian has his dark beer and sausage he will not revolt. It is said that the suburban gates are to be closed at ten o’clock at night. The soldiers’ guns are loaded with bullets. No one dares speak aloud for fear of arrest by the police. Are your daughters grown? Bring one up to be my wife, for if I am to remain single in Bonn I shall not stay long, of a surety. You also must be living in fear. How is good Ries? I shall write to him soon for he can have only an unfavorable opinion of me--but this damned writing! I cannot get over my antipathy towards it. Have you performed my piece yet? Write to me occasionally.

Please send also a few copies of the first Variations.

Your Beethoven.

These “first Variations” obviously are those on the theme from “Rothkäppchen”; those referred to in the early part of the letter the ones on Count Waldstein’s theme. The “piece” whose performance he inquires about is the Octet, and the allusion to it justifies the belief that it was composed for the wind-instrument players of Bonn who found no opportunity to play it while Beethoven was still in his native city. The letter, like that written to Eleonore von Breuning, shows that Beethoven was still thinking of the possibility or probability of a return to Bonn. Its cheerful tone discloses a comfortable, satisfied frame of mind--the mood from which the first Trios proceeded.

FIRST CONCERT APPEARANCES IN VIENNA

We return to the chronological record of events. The first of these in the year 1795, was Beethoven’s first appearance in public as virtuoso and composer. The annual concerts in the Burgtheater established by Gassmann for the benefit of the widows of the Tonkünstlergesellschaft were announced for the evenings of March 29 and 30. The vocal work selected for performance was an oratorio in two parts, “Gioas, Re di Giuda,” by Antonio Cartellieri; the instrumental, a Concerto for Pianoforte and Orchestra, composed and played by Ludwig van Beethoven. Cartellieri was a young man of twenty-three years (born in Danzig, September

27, 1772) who, a year or two since, had come from Berlin to study operatic composition with the then greatest living composer in that field, Salieri. As the direction of these Widow and Orphan concerts was almost exclusively in the hands of Salieri, one is almost tempted to think that he may on this occasion have indulged a pardonable vanity in bringing forward two of his pupils, if we did not know how strong an attraction the name of Beethoven must have been for the public which, as yet, had had no opportunity to learn his great powers except by report. The day of the performance drew near but the Concerto was not yet written out. “Not until the afternoon of the second day before the concert did he write the rondo, and then while suffering from a pretty severe colic which frequently afflicted him. I [Wegeler] relieved him with simple remedies so far as I could. In the anteroom sat four copyists to whom he handed sheet after sheet as soon as it was finished.... At the first rehearsal, which took place the next day in Beethoven’s room, the pianoforte was found to be half a tone lower than the wind-instruments. Without a moment’s delay Beethoven had the wind-instruments and the others tune to B-flat instead of A and played his part in C-sharp.” Thus Wegeler in his “Notizen” (pg. 36). But he has confounded two compositions. The concerto which Beethoven played on March 29, 1795, was not that in C (Op. 15) which was not yet finished, but, in all probability, that in B-flat (Op. 19). For the fact that the Concerto in B-flat was composed before that in C we have the testimony of Beethoven himself, who wrote to Breitkopf and Härtel on April 22, 1801: “I simply want to call your attention to the fact that one of my first Concertos will be published by Hoffmeister, which is not among my best works, and one also by Mollo which, though composed later, etc.” The Concerto in B-flat was published in 1801 by Hoffmeister and that in C in the same year by Mollo and Co. in Vienna, the latter a little in advance of the former, wherefore there need be no surprise at the earlier _opus_ number.

Beethoven also took part in the second concert on March 30, the minutes of the Tonkünstlerschaft recording that he “improvised on the pianoforte”; and though busily engaged he also embraced an opportunity to testify to his devotion to the manes of Mozart. On March 31, 1795, Mozart’s widow arranged a performance of “La Clemenza di Tito” in the Burgtheater. “After the first part,” says the advertisement, “Mr. Ludwig van Beethoven will play a Concerto of Mozart’s composition on the Pianoforte.” We opine that this concerto was Mozart’s in D minor, which Beethoven loved especially and for which he wrote cadenzas.

The Trios, Op. 1, had now become so well known and appreciated in musical circles as to justify their publication, and accordingly, an advertisement inviting subscriptions for Ludwig van Beethoven’s “three Grand Trios” appeared in the “Wiener Zeitung” on May 16, 1795. Three days later a contract was signed by the author and Artaria and Company. The printed list of subscribers gives 123 names, mostly belonging to the higher circles, with subscriptions amounting to 241 copies. As Beethoven paid the publisher but one florin per copy, and the subscription price was one ducat, he made a handsome profit out of the transaction.[73]

FIRST PIANOFORTE TRIOS AND SONATAS

We must tarry a moment longer with these Trios. That the author is disposed to place their origin in the Bonn period has already appeared. Argument in favor of this view can be found in the fact of their early performance in Vienna, for there can be no reasonable question of the correctness of Ries’s story, for which Beethoven himself was authority, that they were played at the house of Prince Lichnowsky, in the presence of Haydn. This performance must have taken place before January 19, 1794, because on that day Haydn started again for England. Now, Beethoven’s sketches show that he was still working on at least the second and third of the Trios after 1794, and that they were not ready for the printer before the end of that year. Further explanation is offered by the following little circumstances: since Haydn was present, the performance at Prince Lichnowsky’s must have been from manuscript. In the morning meeting which probably took place only a short time before the soirée, Beethoven’s attention was called to the desirability of changing in the last movement of the second Trio, the time-signature from 4-4 to 2-4. Beethoven made the change. From these facts it may be concluded that after a first there was a final revision of these Trios and that the former version disappeared or was destroyed after the latter was made. It has repeatedly been intimated that the author believes that the rewriting of compositions completed in Beethoven’s early period is farther-reaching than is generally assumed. The case therefore seems to present itself as follows: Haydn heard the Trios at Lichnowsky’s in their first state; Beethoven then took them up for revision and in the course of 1794 and the beginning of 1795 brought them to the state in which we know them. It is not possible to say positively whether or not the first form, particularly of the first Trio, dates back to the Bonn period.

An interesting anecdote connected with these Trios may well find place here; it is contributed by Madame Mary de Fouche, daughter of Tomkison, who, in the seventh decade of the nineteenth century, was one of the more famous pianoforte manufacturers of London: In the early days of the century, a little society of musicians--J. B. Cramer, the pianist; F. Cramer, violinist, half-brother of the preceding; J. P. Salomon, whose name has so often come up in previous chapters of this work; Bridgetower, a mulatto and celebrated violinist, whose name we shall meet again; Watts, tenor; Morant, also tenor, who married the great Dussek’s widow; Dahmen, Lindley and Crossdale, violoncellists--was in the habit of meeting regularly at Mr. Tomkison’s to try
